Acerca de este libro

Esta es una copia digital de un libro que, durante generaciones, se ha conservado en las estanterías de una biblioteca, hasta que Google ha decidido escanearlo como parte de un proyecto que pretende que sea posible descubrir en línea libros de todo el mundo.

Ha sobrevivido tantos años como para que los derechos de autor hayan expirado y el libro pase a ser de dominio público. El que un libro sea de dominio público significa que nunca ha estado protegido por derechos de autor, o bien que el período legal de estos derechos ya ha expirado. Es posible que una misma obra sea de dominio público en unos países y, sin embargo, no lo sea en otros. Los libros de dominio público son nuestras puertas hacia el pasado, suponen un patrimonio histórico, cultural y de conocimientos que, a menudo, resulta difícil de descubrir.

Todas las anotaciones, marcas y otras señales en los márgenes que estén presentes en el volumen original aparecerán también en este archivo como testimonio del largo viaje que el libro ha recorrido desde el editor hasta la biblioteca y, finalmente, hasta usted.

Normas de uso

Google se enorgullece de poder colaborar con distintas bibliotecas para digitalizar los materiales de dominio público a fin de hacerlos accesibles a todo el mundo. Los libros de dominio público son patrimonio de todos, nosotros somos sus humildes guardianes. No obstante, se trata de un trabajo caro. Por este motivo, y para poder ofrecer este recurso, hemos tomado medidas para evitar que se produzca un abuso por parte de terceros con fines comerciales, y hemos incluido restricciones técnicas sobre las solicitudes automatizadas.

Asimismo, le pedimos que:

+ *Haga un uso exclusivamente no comercial de estos archivos* Hemos diseñado la Búsqueda de libros de Google para el uso de particulares; como tal, le pedimos que utilice estos archivos con fines personales, y no comerciales.

+ *No envíe solicitudes automatizadas* Por favor, no envíe solicitudes automatizadas de ningún tipo al sistema de Google. Si está llevando a cabo una investigación sobre traducción automática, reconocimiento óptico de caracteres u otros campos para los que resulte útil disfrutar de acceso a una gran cantidad de texto, por favor, envíenos un mensaje. Fomentamos el uso de materiales de dominio público con estos propósitos y seguro que podremos ayudarle.

+ *Conserve la atribución* La filigrana de Google que verá en todos los archivos es fundamental para informar a los usuarios sobre este proyecto y ayudarles a encontrar materiales adicionales en la Búsqueda de libros de Google. Por favor, no la elimine.

+ *Manténgase siempre dentro de la legalidad* Sea cual sea el uso que haga de estos materiales, recuerde que es responsable de asegurarse de que todo lo que hace es legal. No dé por sentado que, por el hecho de que una obra se considere de dominio público para los usuarios de los Estados Unidos, lo será también para los usuarios de otros países. La legislación sobre derechos de autor varía de un país a otro, y no podemos facilitar información sobre si está permitido un uso específico de algún libro. Por favor, no suponga que la aparición de un libro en nuestro programa significa que se puede utilizar de igual manera en todo el mundo. La responsabilidad ante la infracción de los derechos de autor puede ser muy grave.

Acerca de la Búsqueda de libros de Google

El objetivo de Google consiste en organizar información procedente de todo el mundo y hacerla accesible y útil de forma universal. El programa de Búsqueda de libros de Google ayuda a los lectores a descubrir los libros de todo el mundo a la vez que ayuda a autores y editores a llegar a nuevas audiencias. Podrá realizar búsquedas en el texto completo de este libro en la web, en la página `http://books.google.com`

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

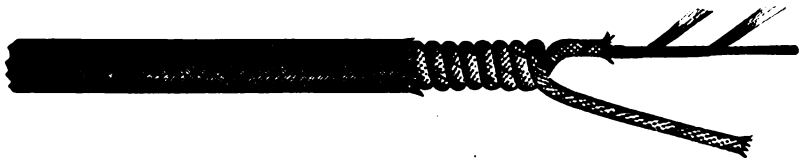
THE CORD THAT LASTS.



This cord consists of two steel piano wires covered with a spiral of fine copper wire. The cord is then insulated with a silk and cotton insulation and each conductor is covered with a cotton braid, one of the conductors having a red tracer so as to distinguish it from the other. The conductors are then formed into a spiral and covered with a heavy, waxed, gray Gilling Thread.

"EACO" STEEL SWITCHBOARD CORD

will outlast anything on the market. Write and get prices, and when doing so state what make of switchboard you are using.

Telephones vs. Prices

Do not ask us to meet the prices of cheap competition. The value of WESCO Telephones will not permit it.

We are in the telephone business on a quality basis, that's the only kind of telephone we can afford to sell, and it is the only kind you can afford to buy.

Measured by the actual returns on the investment, WESCO Telephones are the cheapest telephones made.

ABOUT BRASS

Most mechanical parts of telephone apparatus are made in punch presses and lathes rather than by casting as in former years. This permits using automatic machinery and a higher grade metal—a cheaper, more accurate and serviceable product.

There are two compositions of brass used. Switchboard plugs and posts are turned from rods in automatic screw machines; transmitter backs, generator frames and gear wheels, switchhooks and so forth, are formed from sheets in punch presses. Turning brass, per 100 pounds, is 66 pounds 10⅔ ounces copper, 31 pounds 5⅓ ounces zinc and two pounds lead—the lead is added for free cutting quality; stamping brass is 66 pounds 10⅔ ounces copper and 33 pounds 5⅓ ounces zinc.

In making brass the copper is first melted in crucibles and the other metals added afterwards; for the temperature required to melt copper would burn the zinc or lead. It is then cast into bars and formed cold in sheets or rods by a succession of rolls, gradually reducing it to the desired gauge. For turning brass the bars are first rolled to within an eighth or quarter of an inch of their final size and latterly reduced by drawing through dies—not cut, for the metal is forced back upon itself, thus forming a rod of greater length. In the reduction of metal 7 or 9 gauges, it is necessary, during the process, to soften it by heating and plunging in water; for the roll pressure tempers or hardens it. (Brass or copper hardens by being allowed to cool slowly, while steel is softened by the same process.)

The brass stock is tested and analyzed before it is used; for it must be universally accurate in gauge and composition to admit of the free action of the machines.

All "NORTH" punching brass stock is of a heavier gauge than usual—it gives the parts that solidity and wearing quality found only in "NORTH'S" apparatus.

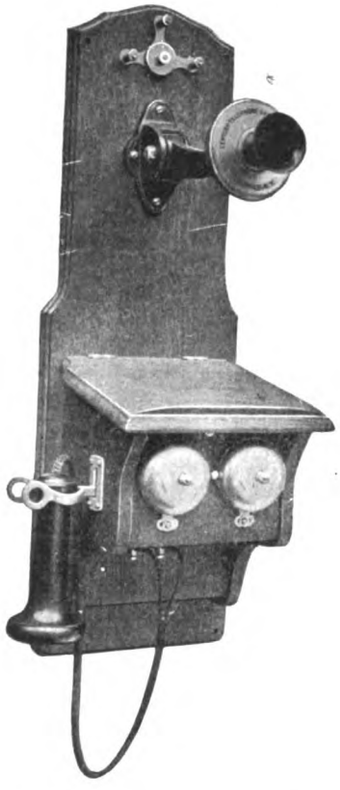
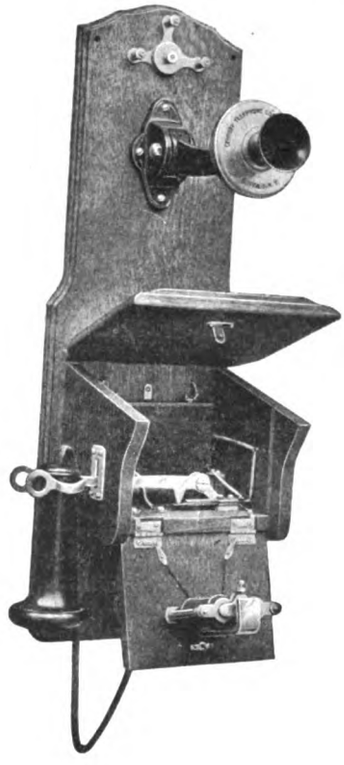
CENTURY
100 % GOOD

IN COMMON BATTERY TELEPHONE SERVICE





it is absolutely necessary that the telephones are perfect, electrically and mechanically.

We manufacture wall and desk telephones for this class of service. During the past five years these telephones have proven to be the most efficient and reliable made.

Our No. 70 wall telephone is so constructed that all parts are easily accessible.

The cabinet, made of quartered oak, is small and well proportioned.

The telephone is equipped with our No. 5 Platinum Electrode Transmitter and No. 11 Perfection Receiver.

A trial of this instrument will convince you of its efficiency and reliability, and if interested we will be pleased to send you one or two of these instruments on 60 days' trial, charges prepaid.

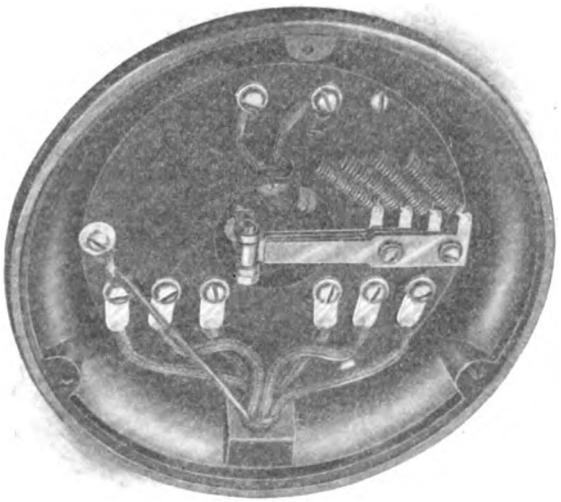
MONARCH APPARATUS

THE DESK SET



All wiring of a Monarch Desk Stand terminates in the base. The transmitter connections are metallic, and are brought down in two conductor silk cord. The hook switch springs being mounted upon the base, no other wiring passes through the pedestal tube. The connecting plate is made of hard rubber. All connections are plainly marked. Clips are provided for the receiver and connecting cords. All connecting plates are interchangeable. Local battery desk sets can be made to common battery by changing the connecting plates and transmitters. All Monarch Telephone Apparatus is described in the new catalogue. A copy will be sent upon request.

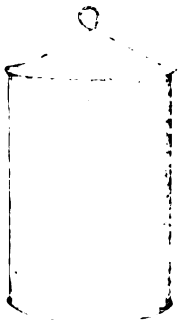
SIDE BRACKET.

Patented



TYPE A—10-Pair Hall Cable Box.

Do You Use Cable?

If you do, you know its advantages. If you don't you should get acquainted with it. But cable distribution requires the use of terminal boxes. In the selection of the right one you may err, therefore it is best to buy the one that has the greatest amount of merit. That one is the HALL. It was designed by a man who is an expert in cable construction. There being none on the market that suited his ideas, he set about inventing one, and he invented a good one. So good, in fact, that those companies which have tried it would as soon install bean sticks for their pole lines as to use any other cable terminal. That's a pretty strong comparison, but we know it is right, and so will you if you only write us for a trial order.

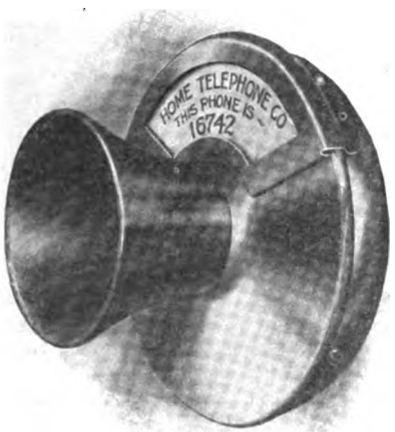
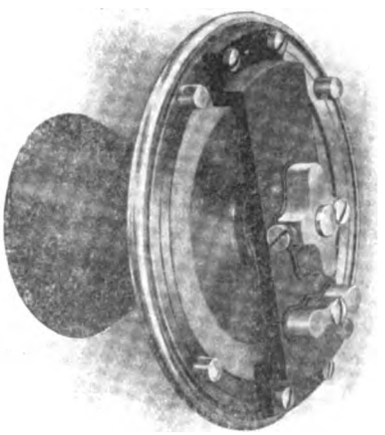
DEAN TELEPHONE APPARATUS

Dean Transmitters.



Front View Showing Card Holder.



Back View Showing Cover Removed.

Our transmitters have from the first set a new standard of excellence, not only in point of transmission, but in careful design and construction.

They have furthermore stood up under the most exacting service, where other makes of instruments have utterly failed.

The direct acting principle on which they work produces the best possible results. It is an actual mechanical motion, not hidden theory.

We now house our transmitters in a new case, made from rigid drawn brass, thus doing away with the uncertainty of a casting. This new front, is, of course, interchangeable with all other parts of our first transmitters.

All of our telephones, both magneto and common battery, are fitted with these transmitters—the soul of the instrument.

This is one of the reasons why our telephones have active life.

The construction and high grade material used insures long life.

These statements are backed by our guarantee.

We can make prompt deliveries on all regular telephones.

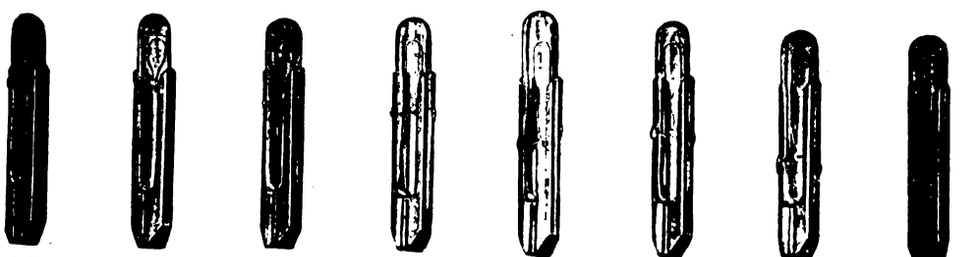
MINIATURE LAMPS

FOR TELEPHONE SWITCHBOARDS, ETC.



4-V .2-Amp. | 4-V .4-Amp. | 10-V .1-Amp. | 16-V .1-Amp. | 20-V .1-Amp. | 24-V .075-Amp. | 40-V .085-Amp. | 48-V .075-Amp.

ADVANTAGES

1.—**OUR TIPLESS LAMPS ARE UNEQUALED.** The lamps are rounded off on the front end, thereby forming a small but effective convex lens which focuses all the light rays into the most desirable position.

2.—**THE EFFECTIVE CANDLE POWER IS THE MAXIMUM.** This is due to the lens effect and the high electrical efficiency.

3.—**THE FILAMENT IS VERY DURABLE.** They are manufactured by our special process, which produces exceptionally strong, uniform, and long lived carbon.

4.—**CHEMICALLY PURE PLATINUM IS USED WHERE THE CURRENT IS CARRIED THROUGH THE GLASS.**

5.—**THE LAMPS HAVE THE HIGHEST VACUUM OBTAINABLE.** This gives long life and greatly reduces the conduction of heat from the filament to the jack.

6.—**EACH LAMP IS GIVEN A CAREFUL INDIVIDUAL TEST FOR VOLTAGE, CANDLE POWER, MECHANICAL PERFECTION AND SIZE.**

Are You Satisfied

with the manner in which your telephone system is operating?

Do your subscribers become displeased and out of patience with your line and the management of it because of the "listening in" of others?

Must their messages be delayed because of the carelessness of others in leaving their receivers off the hook "cutting out" the rest of the line?

Now Mr. Manager-of-the-telephone-company it's clearly up to you to eliminate these faults and (incidentally) improve the efficiency of your line 100 per cent. by installing condensers of approved design and recognized merit.

Such condensers are the product of our factory and are called

ANDRAE CONDENSERS

They are well known for their effectiveness and durability, but if you are in any way undecided as to their value we will equip an entire line on trial and pay return charges if unsatisfactory.

We manufacture three distinct telephone condensers and consider them the best.

They are the "Standard," Type XX, which is made to withstand 300 volts, alternating current, indefinitely and comes in various capacities from 1-4 M.F. to 3 M.F.

The "Special" No. 225, actual size 2 11-16 x 1 1-2 inches, terminals included, is easily installed in any bridging magneto box and recommended for use on 'phones already in operation.

Telephone Condenser No. 186 is our new form of condenser fitted in a handsome, quarter-sawed oak case. Easy to install because of its simple, compact form.

Andrae Telephones Never Disappoint

We manufacture telephones and telephone accessories. None better.

WRITE FOR CATALOG NO. 11, which tells all about our products.

JULIUS ANDRAE & SONS COMPANY

CHEAP VS. EFFICIENT SERVICE

The cheapest telephone service in the world is dear at any price if it is not efficient.

When a man installs a telephone he wants to be able to use it and not to abuse it.

A grounded line nine times out of ten is noisy, and foreign noise on a telephone line will arouse a feeling of anger in the heart of the user that isn't good for the company. You can keep your lines free from grounds and other troubles by periodic tests with a Pignolet voltmeter, and when they do occur, you can locate them with this instrument, and get them cleared often before the subscriber knew his line was in trouble.

If you need your subscribers' good will, you need my voltmeter to get it.

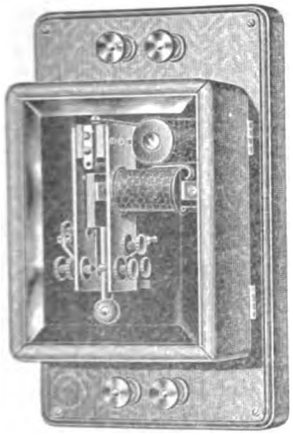
SIMPLICITY
is the Keynote of Success

A simple device which accomplishes the same results as a more complex one is certainly more preferable. The Sandwich Pole-Changer is the simplest device ever constructed for ringing purposes. There are but three contact springs and as these engage alternately with their opposite sides they cannot be forced out of position by constant use.



It requires no adjustment, as this is done at the factory and is permanent.

The use of a primary constant current battery to operate the vibrator has been dispensed with; a minute quantity of current, hardly a milliampere, being taken from the ringing battery, through suitable resistance coils for this purpose.

It will work in either a vertical or horizontal position, which permits it being hung on a wall or mounted on a cabinet. Another excellent feature is that it is practically noiseless. There are others which are described in our free booklet. Let us send it to you.

THE SANDWICH POLE-CHANGER CO.
400 EDDY STREET, SANDWICH, ILL.

TO YOU, MR. TELEPHONE MAN

In no branch of the electrical field are there better opportunities for technically trained men than in the one devoted to Telephony. The tremendous growth of this business has created a demand for competent men which is much greater than the available supply. Not a week passes, but there appears in the want columns of the electrical journals advertisements for capable men.

ARE YOU COMPETENT TO FILL A BETTER POSITION?

If not, you should not allow a day to pass before you start on the road to improve your knowledge.

The AMERICAN SCHOOL OF CORRESPONDENCE offers you a ready means whereby you can secure the desired technical education which will lift you out of the ordinary rut. You do not have to waste a moment's time away from your present employment. You can be trained by expert instructors in the science of Telephony, and you will receive personal attention the same as if you attended an Engineering School.

The course of study in Telephony embraces every phase of the business from the simplest to the most complex problem. The **why** and **wherefore** of every part in a system of any description is explained in such a thorough manner as to preclude any possibility of doubt as to its usage.

To the young man who wishes to succeed in the telephone field, no better aid could be secured than is furnished by the prescribed studies of the American School of Correspondence.

Think the matter over carefully. If you believe your position could be improved mark X opposite course interested in, fill out and send coupon to us to-day, and we will send full information and 200-page hand book.

Tuition fees are moderate—from $10.00 up—and may be paid in small payments. An inquiry brings information but not an agent to constantly annoy you. We employ no agents. All money paid by the student is used in instructing the student.

The Switchboard You Should Buy

Because it will enable your present operating force to handle nearly twice as many lines. That's just what our Generator Call Visual Signal Switchboard will do and any of our customers using this type of equipment will gladly tell you so if you care to write them.

The above is one of our standard cabinets with this equipment. It shows how the line signals are mounted, how easily additions can be made or any signal removed if desired.

Rapid in operation, inexpensive to maintain. In fact, the maintenance, compared with the service the board gives, is practically nothing.

Let us make you a proposition on some one of our cabinets with this type of equipment.

We will gladly mail descriptive printed matter free.

That the Automatic Machine Is a Success Has Been Demonstrated Beyond a Doubt.

Caleb L. McKee & Co. says—"That the automatic telephone is a success has been demonstrated beyond a doubt, and the favor with which it has been received by the local public is indicated clearly by the upward movement in the securities of the Columbus Citizens' Telephone Co. At the beginning of the installation of the automatic switchboard the common stock was quoted at about 55 bid while at this time 75 is bid with nothing offered below about 85; the preferred has advanced from par to 107 bid with holders asking 111, and it seems likely to reach a much higher level."—Columbus Railway.

Since Oct. 24th these stocks have gone up,— the common to par, the preferred to 113½, and they are scarce at that. Our automatic System did it - can do it for yours. Why do you wait?

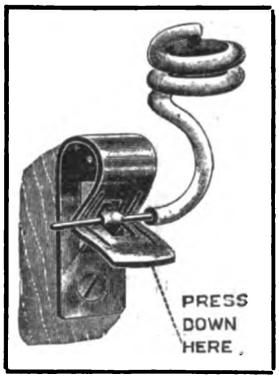
AUTOMATIC ELECTRIC COMPANY
Van Buren and Morgan Streets, CHICAGO, ILL.

JUST CONSIDER

The small amount of time it takes for an inspector's salary to add 25 per cent. to the cost of the dry battery he is inspecting or connecting up.

That is maintenance cost and it ought to be considered as carefully as the first cost. It's just as important.

That is why you should specify



FAHNESTOCK
Spring Binding Posts

when ordering dry batteries. It lowers the cost of maintenance. It does this by doing away with loose connections, dirty contacts and broken wires. It not only saves your money, but it saves all the annoyance arising from these defects and it doesn't cost you a cent to have your batteries so equipped. Just write Fahnestock Spring Binding Post on your next order, no matter what make of battery you use, and insist that you get it.

Let us send you a sample post. It's free.

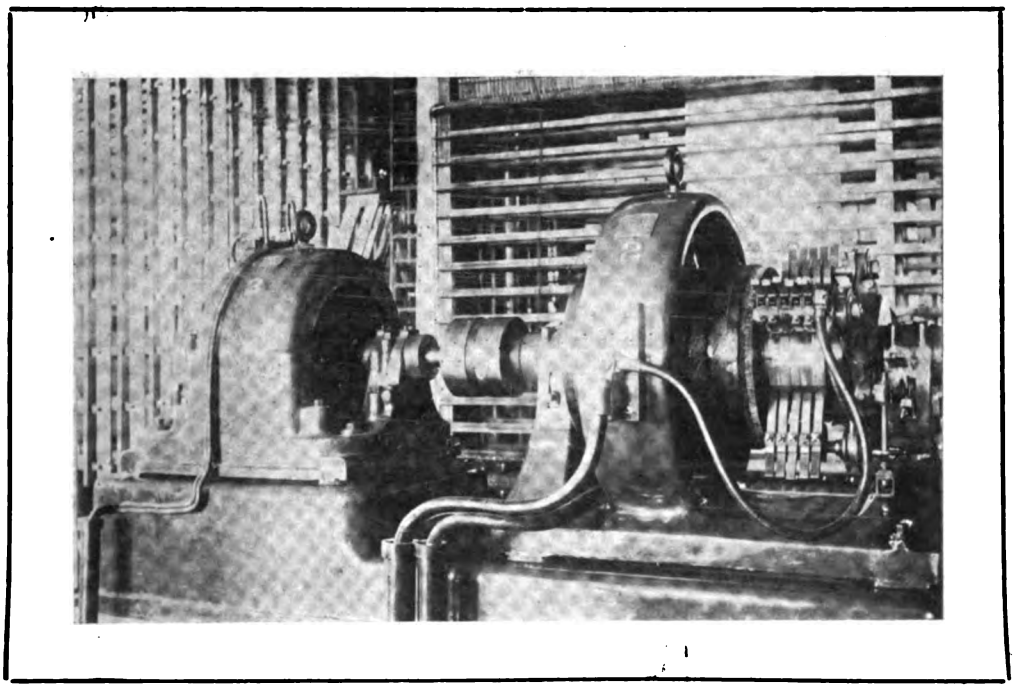
Power Installation

By Arnold F. Pierce.

THE purpose of this article is to give a description of the apparatus used, with the method of installing it, in a modern telephone power plant. Owing to the diversity of systems in use, it is practically impossible to give a discussion sufficiently broad to fit all cases, and at the same time so exact as to definitely describe the features of a single plant. The descriptions in this article will therefore refer to the details of an imaginary plant which closely follows the plans laid down by one branch of modern telephone practice.

In central energy systems electric current is supplied to the circuits within the office to actuate signals and furnish battery supply to the operators' transmitters. In addition to this it may be used to operate the motor of the set used to furnish ringing current, and for special interrupted currents for signalling purposes. In some exchanges where ringing current is furnished by a pole changer, the main central office source of energy is used to operate the pole changer vibrator. Current furnished from the central office, passing over the lines and through the instruments at subscribers' stations, is the primary source of the voice currents which cause the reproduction of the words uttered before the transmitter.



Typical Direct Connected Motor Generator Set for Charging Storage Batteries in Telephone Exchange; Generator at the Right.

The necessity for a continuous, steady and reliable source of current for performing the functions above referred to needs no discussion. Such a current is furnished from storage batteries charged by specially designed generators. At times when the batteries are being charged, the current for the operation of the system is furnished directly from the generator. During these periods the battery and exchange load are connected in multiple across the generator terminals. The generator is usually operated by a gas engine, a direct current motor, or an induction motor, according to the source of power available. In the circuit shown in Fig. 1, connections are arranged for the use of an induction motor, operated by a three-phase alternating current. The shafts bearing the armatures of the two machines are coupled together, making a direct-connected pair. The current which causes the rotation of the motor is supplied from the mains of the company which furnishes electricity to consumers throughout the city. It enters the building in the usual manner, and after passing through the switches, meter, fuses, etc., usually installed by the electric light company, is carried to a power protection panel. This panel consists of a base of heavy slate, carrying a main line switch, and protective devices. The panel is set out some little distance from the wall by an iron frame work. The protective features consist of fuses for opening the circuit on the passage of a heavy circuit, due for instance to a short circuit, and of devices for carrying away lightning discharges.

The latter arrangement consists of a spark gap between each wire and ground, with a number of turns of wire forming a reactance coil connected on the machine side of the spark gap, as shown. Any lightning discharge, meeting the high impedence offered by the reactance coils, will be diverted to ground through the spark gap. The apparatus for this spark gap usually takes the form of a metallic globular terminal, about 1¼ inches in diameter, separated by a very slight air-gap from a similar metallic ball, which is thoroughly grounded, and connected by a bus bar to other similar balls on the grounded side of the circuit.

From this panel the power wires are taken through iron conduits to the power switchboard. This is also of slate, and is made in three sections, or panels. In the first is mounted a switch for operating the induction motor for the ringing machine, as well as the switch for starting the motor which drives the dynamo. In circuit with the line connected to the motors is a starting box, designed to introduce resistance and maintain the current at a proper value up to the time the motor attains its full speed, when the full strength of current is thrown on by reversing the switch.

As stated, the motor is directly connected with the generator, and both are mounted upon the same iron base. This rests upon rubber calks, which in turn are set upon a brick foundation built up on the floor of the power room. The bases are held in place by bolts passing through holes in the iron work, and down

Digitized by Google

through the rubber calks into the brick pier. These bolts are set into the bricks at the time the foundation is laid, and must be accurately spaced. The rubber calks absorb a great deal of the vibration attendant upon the high speed of the machine.

One of the types of generator usually favored for charging purposes is a shunt-wound, four-pole type, giving a pressure of about thirty volts. These machines are made in various sizes, having current outputs of different quantities, so that a machine may be chosen to carry an exchange load of any estimated dimensions.

The leads from the generator to the power board are conveyed in separate conduits, and with one is also carried the small wire for the generator field rheostat. The leads are of heavy copper wire, stranded, as a rule, to secure greater flexibility. They are attached on the middle panel of the power board to a main-line switch, which opens the circuit to the machine. The field rheostat, connected as shown, is used to vary the output of the generator, in order that current may be supplied to the battery and system at the proper voltage.

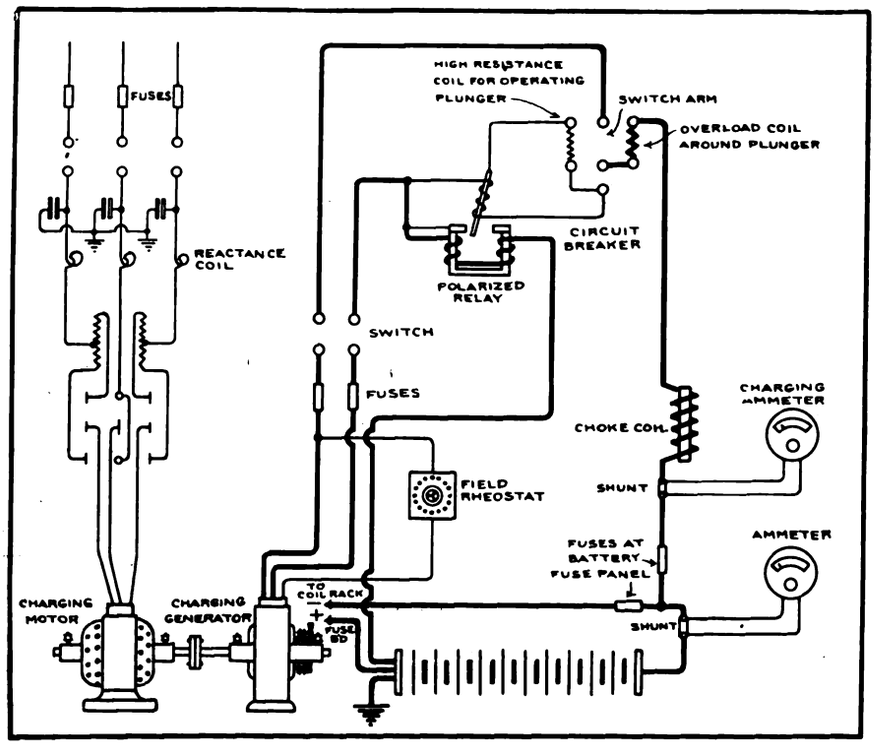


Fig. 1. Charging machine circuit to storage batteries.

From the main switch the positive side of the circuit is carried by bus-bar work through the polarized relay, and thence through the circuit breaker. This device is essential as a protective feature, and many efficient types are offered by the trade. The apparatus is designed for two purposes. The first of these is to open the circuit upon the occurrence of an overload, due to a short circuit or ground.

The opening of the circuit is effected by the drawing up of a plunger mounted in the center of a solenoid. Upon reaching a predetermined height, this plunger trips a retaining mechanism, which, upon being released, allows the main switch bar to fly back under the influence of a spring. The line circuit is broken at carbon switch contacts. It is obvious that by the opening of the circuit at this point the flow of a current sufficiently strong to unduly heat wires through which it passes will be broken before it can raise them to a dangerous temperature.

The second function of this circuit breaker is to open the circuit if at any time the direction of current is reversed. A possible instance of this which may be cited, would occur if for any reason the circuit supplying the motor should be interrupted. This would cause the generator to slow down, until the difference of potential between the brushes, due to the current delivered from the generator armature, would be less than that due to the electro-motive force of the battery. Upon the occurrence of this state of affairs, current for the operation of the exchange would be supplied direct from the battery. In addition to this the direction of current through the polarized relay would be reversed. The pivoted armature of this relay is retained in a magnetically polarized condition by the passage of current through a coil wound in such a manner as to magnetize the core with a polarity which will cause it to be repelled by the left hand contact pole of the field magnet. This current passes from a connection on the positive side of the charging circuit in a coil about the armature core, and thence to the lower contact of the switch bar, which is used to open the negative side of the charging circuit. The attraction of the armature, due to the reversal of current, and consequently of the magnetic polarity, in the field of the polarized relay, closes a circuit through a second, high resistance solenoid on the circuit breaker. This also actuates the plunger, trips the switch, and opens the charging circuit. It also opens the local circuit through the high resistance winding

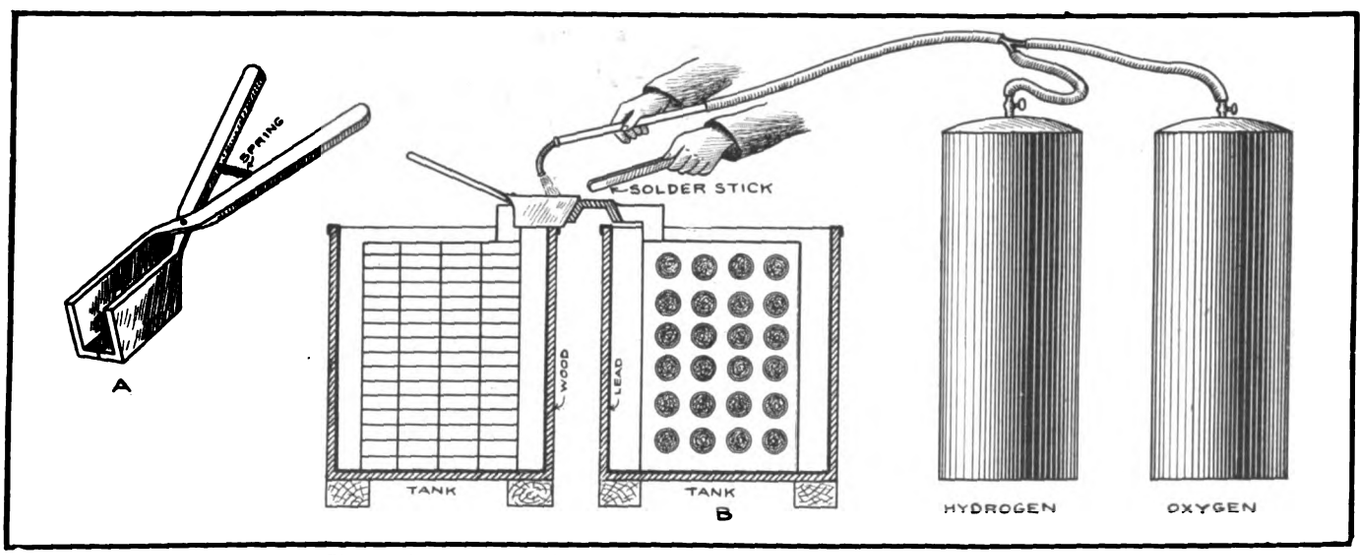

Fig. 2. Arrangement for burning plates of storage battery cells to terminal bar.

Digitized by Google

of the circuit breaker, as well as the one through the polarized relay armature winding. These circuit breakers are so designed, that they may be adjusted to release at a predetermined voltage, or load, and are a vital part of the charging circuit.

From the polarized relay the positive wire is usually carried directly to the positive terminal of the storage battery, and is there sweated into a lug provided and burned into the lead terminal bar of the battery. The negative lead runs to a special fuse panel, located near the negative terminal of the battery. This panel carries the main fuses in the charging and discharging circuits, and usually it is also arranged for the insertion of ammeter shunts in the circuit. The ammeter shunts are small bars of copper, having an accurately measured resistance. It is evident that the passage of a given current through this known resistance will produce a definite drop in the voltage between the two terminals of the shunt. The leads to the ammeter, composed of a pair of wires, one of which is attached to each end of the shunt, convey a current due to this difference of potential which is sufficiently great to move the needle of the ammeter. Any variation in the current through the shunt produces a change in the "drop," in potential, which is equal to the product of the resistance of the shunt and the current flowing through it, as expressed by the well-known formula, $E = C \times R$, where E = the difference in potential between terminals of the shunt, R = the resistance of the shunt and C = the current in the main circuit. The consequence is that any variation in the current is measured by the ammeter on the shunt circuit. Although what the instrument really measures is a difference in voltage, as this difference in voltage is proportional to the current, it is an easy matter to arrange the divisions on the scale of the ammeter to show the number of amperes passing through the circuit.

After leaving the circuit breaker, the negative lead is sometimes taken through a retardation or choke coil. This is of wire sufficiently heavy to carry the current, and has a core consisting of fine iron wires. Its object is to smooth out the variations in current, produced in the charging circuit by the dynamo, and, as this has been reduced to a minimum in modern genrators the coil is frequently omitted from the circuit.

The duty and action of the storage battery has been previously referred to, but a few descriptive details may not be out of place. Each cell is made up of three elements, namely, a positive plate, a negative plate, and the acid solution. The positive plate is dark brown in color, as distinguished from the natural

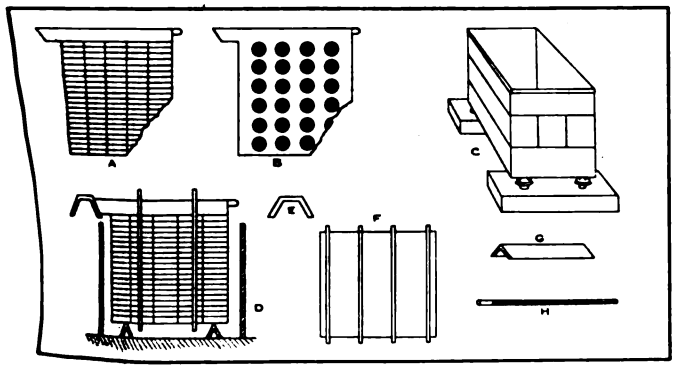

Fig. 3. Details of parts of storage battery cell.

lead color of the negative element. Fig. 3 shows the structure of the plates, or elements of one of the familiar types of cells. "A" is the meshed surface of the negative plate, and "B" shows the disposition of the active element of the positive. In building up the cells the latter is usually the odd number, i. e., there will be twelve negative plates to eleven positive.

In large installations, the containing vessel is usually a lead-lined wooden tank. These tanks are raised from the floor or supported by a glass insulator, somewhat resembling the upper part of a two-piece transposition glass insulator. A little raised button on the top sets into a provided cavity in the base of the tank. Four of these are used to each cell, guarding against electrical leakage. Fig. 3, C, shows a cell so raised from the floor, and Fig. 3, D, shows a cross-section of a cell, showing one plate in position. At the right and left ends of the plates, there are set beneath the projecting lugs, upright, transverse plates of glass, to guard against a possible contact with the lead lining in case of a lug breaking loose from the bus-bars. These are not shown in the illustration. Two glass tubes are placed between each pair of adjacent plates to prevent short circuiting of buckled plates. These are held in place by perforated strips of hard rubber. A recent idea is to do away with the glass tubes and use a sheet of very thin wood between the plates. These are each supported by three slotted cylindrical strips of wood, H, which are set upon the bottom of the tank, between plates. The wood separators are passed through the slots and are thus

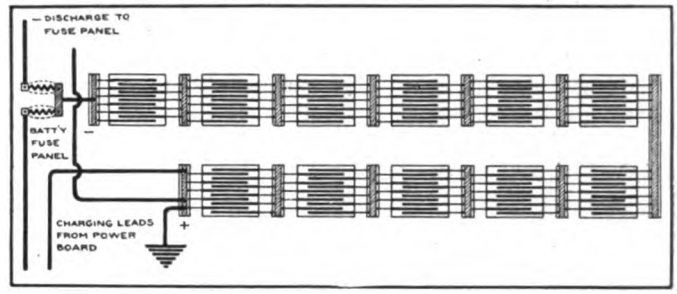

Fig. 4. Layout of storage battery plates and terminals.

retained in position and prevented from warping. This idea has come in general favor with the Bell interests. Below the plates, angular strips of glass similar to that shown at G, Fig. 3, are laid on the floor of the tank to keep the plates from the lining, and to lessen the strain upon the lugs, by which the plates are attached to bus-bars.

In assembling the elements in a cell, the heavy end plates of glass are first set in position at each end of the cell, and the angular strips are laid upon the floor of the tank. The plates are then set down in the cell, their front and back shoulders resting on the vertical glass plates. The positive and negative elements alternate, the lugs of each being at opposite ends. When used the glass tubes are placed between the plates for proper spacing. Beginning at cell No. 1, the plates of the battery are set in order, a string stretched above the battery being used to insure accuracy of line. When a battery of eleven cells is installed, economy of space is usually obtained by setting them in two rows.

When the plates are in position, and in proper alignment, they are ready to be attached to the bus-bars. The terminal bus-bars are solid metal, but are the same outline as the hollow and lighter bars between the individual cells, as shown in Fig. 3, E. Brass or copper lugs are provided on the terminals to provide attachment of the charging leads and ground. In Fig. 4 is shown the general appearance of a storage battery in operation, and the usual arrangement of terminals and plates in a storage battery as set up for operation.

The joining of the plates to the terminal bars is accomplished by "burning" the lead terminals together. A pair of lead burner's tongs (Fig. 2, A) is clamped over the lug of the plate, and close against the beveled face of the bar, as in Fig 2, B. The burning of the lug to the bar can be accomplished by two methods; viz., by using a gasoline blow-pipe flame, or by using the oxy-hydrogen jet, as used in the calcium, or lime light. In the hands of a novice, the former method has the advantage of a less intense heat, and less skill is required, but the work should hardly be attempted by one unfamiliar with lead burning. With the oxy-hydrogen flame, in the hands of a skillful workman, a particularly neat job can be made in much less time than with a blowpipe flame.

The lugs and bus-bar are scraped free of dirt and grease previous to setting them in position, and the flame is played upon them until the surfaces are in a molten state. A bar of hard solder is held in the flame at the same time, and this melts and runs into the metal of the lug, and bus-bar surfaces, and, with the tongs as a mould, forms a perfect union of the two.

Economical Telephone Accounting and Filing Systems

ARTICLE II.—THE GENERAL LEDGER.

*By Charles C. Wilmot, Telephone Accountant.

This article and all forms reproduced have been protected by individual copyrights.
Copyright, 1906, by The American Telephone Journal Company. All rights reserved.

CORRECT methods and the proper classification of accounts in the General Ledger provide a reliable foundation upon which to build a successful telephone business. We illustrate four Special Ledger forms, an Index Sheet and two styles of Binders for the handling of these important records. The loose leaf plan offers many advantages over bound books. If it is considered necessary, binders can be provided with special locks and keys to prevent the removal of any account by unauthorized persons.

Form No. 2 is designed to care for all accounts not specially provided for in the other forms. By writing in words "Debit" or "Credit" at head of columns, sections can be used for one, two or three debits to one credit column, or the reverse, as may be desired. A careful study of the printed headings of Forms No. 3, 4 and 5 will make their practical use self explanatory.

The following plan will present a basis for the separation of accounts, which can of course be modified to suit the size and needs of different exchanges and large systems. It is founded upon a classification of accounts into six main divisions as follows: Investment and construction accounts; accounts receivable; operating; maintenance; general accounts, and accounts payable, or liability accounts.

Under the first of these divisions should be placed all figures relating to the following items: Plant and equipment; real estate and buildings; underground construction; aerial construction; tools and machinery; material store room; office furniture and fixtures; toll lines. These are to be arranged in alphabetical order on form No. 3; items relating to local and branch exchanges should go on forms Nos. 4 and 5, being arranged in alphabetical order with necessary index sheets to afford means for easy and rapid reference. The figures at the heads of columns, in these forms, can be used in making distribution on expense vouchers, voucher checks, etc., instead of writing out the words, "construction, reconstruction," etc., and thus save a considerable amount of time.

It will be noticed that the cost of all material used for construction, reconstruction and maintenance is kept separate from labor charges and other expenses, thus giving a check on material used for any period.

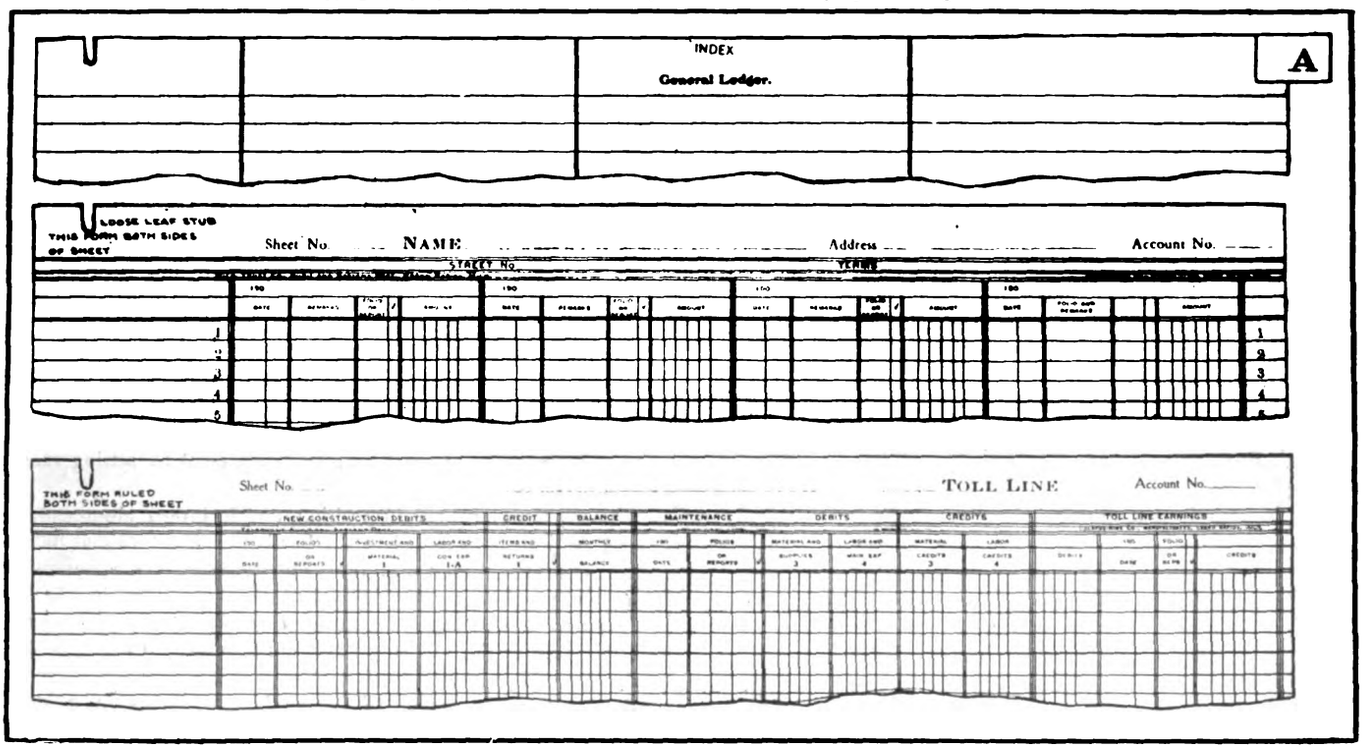
Under the heading "Accounts receivable" come bank accounts; petty cash; personal accounts for cash; advances to foremen, construction men, branch exchange managers, etc.; accounts for material sold other companies, etc.

For the local exchange rentals and tolls, the totals, shown on form No. 4, give the amount of unpaid outstanding accounts in subscribers' ledgers. Branch exchanges' rentals and tolls for amounts outstanding in outside branch exchange ledgers are also provided for. A suspense account shows in totals the amount of inactive or doubtful accounts closed off to an auxiliary ledger, when telephones are removed, for each current month. In a division for outside toll accounts receivable are shown, in totals, the amounts outstanding for uncollected tolls at exchanges or toll stations not shown in above accounts.

The class of accounts embraced in the main division for "operating expenses" is provided for on the last section of form No. 5 for exchanges, and for toll lines on form No. 3, in the debit column of the toll line earnings section.

Maintenance accounts are provided for on forms Nos. 3 and 5. The costs of material used are to be kept separate from the labor and other expense. A reconstruction account is provided

Copyright, 1906, by The American Telephone Journal Company. All rights reserved.



Forms No. 1, 2, and 3, counting downward in order from top of illustration.

*Editor's note: Mr. Wilmot is manager of the Telephone Systems Department of the Edward E. Hine Company.

Digitized by Google

for in forms Nos. 3 and 5. All charges of this nature should be closed into the maintenance section at the closing of the year's business.

Under the 5th division, general accounts, come the items for advertising; bond interest; collecting expenses; directory expenses; damage and accidents; freight, express, and cartage; fuel and heat; general office expense; insurance; interest and discount; light; legal expense; office salaries; postage account; pole and right of way rentals; stable expense; soliciting expense; stationery and printing; traveling expense; taxes; water; profit and loss; and dividend account.

In the 6th division, accounts payable or liability accounts; capital stock; bonds issued; bills payable; open accounts payable; voucher accounts payable; advance rentals; unpaid wages; surplus account; unpaid dividends; depreciation.

The above classification is sufficient for the general ledger accounts of most companies. Where further subdivisions are desired for construction, operating and maintenance accounts, we would suggest the keeping of them in an auxiliary record, a book made up with ruled columns for dates, voucher or check numbers and amounts, in which as many subdivisions can be made as desired. Form for this record will appear in a later article.

In the report of the convention of the National Committee on Standard Forms held in June, 1905, a very complete list was given: This report was published in full in THE AMERICAN TELEPHONE JOURNAL, issue of June 24th. It is suggested that this report be cut out and pasted in the cover of the general ledger of all telephone companies for future reference.

Taking up the subject of construction charges there arises the question: "What are legitimate charges?" These include original cost of real estate, buildings, rights of way, cost of franchises, engineering, expenses incurred in negotiating stocks and bonds and discounts allowed on same, interest on bonds during construction, material used in construction, with freight and cartage and cost of labor, switchboard, wire plant, substation equipment and all improvements or additions which increase the value of the original investment. This embraces the cost of new work installed to replace old, less the cost of the old; the difference between the costs of iron and copper in replacing iron with copper wire, etc.

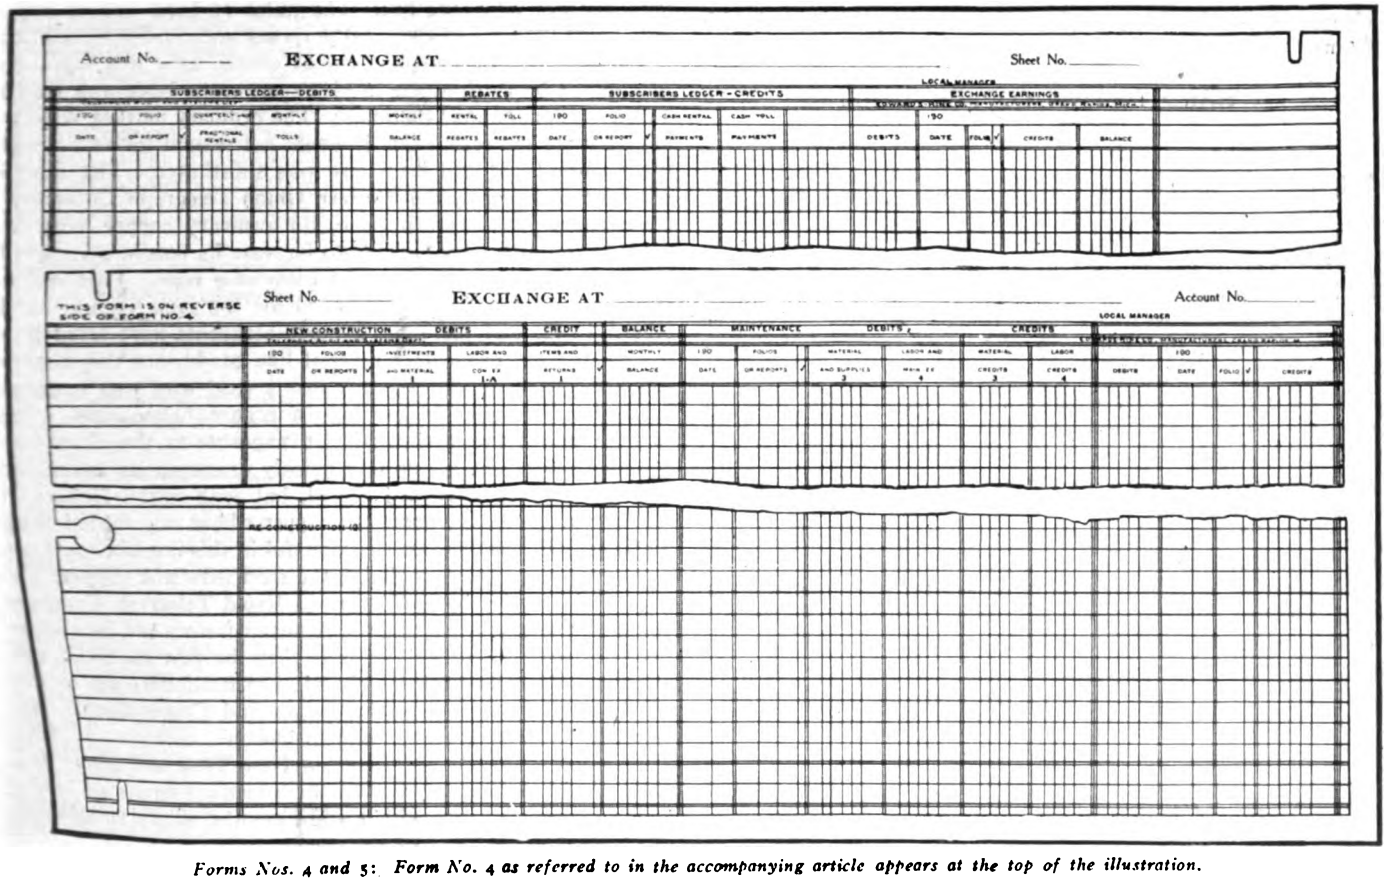
Maintenance charges are supposed to cover the cost of material and labor expended in keeping the inside plant, subscribers' equipment and lines in good condition, thereby making good natural wear and tear and damages by storm or accidents. This division properly includes transportation and traveling expense incurred by men while clearing trouble, wages of wire chief, switchboard men, trouble men, inspectors, etc. It also takes in the cost of moving telephones and changes of subscribers' equipment when these cannot be charged to subscribers, cost of removals, etc.

Operating expenses include the cost of maintaining the traffic department, salaries of local or long distance chief operators, inside trouble clerks, service inspectors, cost of power for operating central office plant, substation batteries, as well as a pro-rata proportion of stationery used, light, fuel, heat and water, dining room expense, etc.

The general expense account covers all accounting and filing department expenses, such as salaries of managers and assistants, clerks, etc., not chargeable to previous accounts mentioned. Into this account can be closed at the end of a period the expense of collectors, directory, stationery, and also printing, advertising, office supplies, light and heat.

The subject of depreciation is a puzzling question over which the average Board of Directors in the rapidly growing telephone companies throughout the country has had many struggles. The border line between maintenance and depreciation seems hard to define to the management, who are not versed in accounting methods. Cost of maintenance can be closely estimated by almost any observant manager and its charges are quite fully defined in a previous section, while depreciation is, in nearly all cases, an undetermined quantity. It is a reduction of the assets of the company resulting not only from natural wear and usage but more frequently from the many rapid improvements in the art

Copyright, 1906, by The American Telephone Journal Company. All rights reserved.

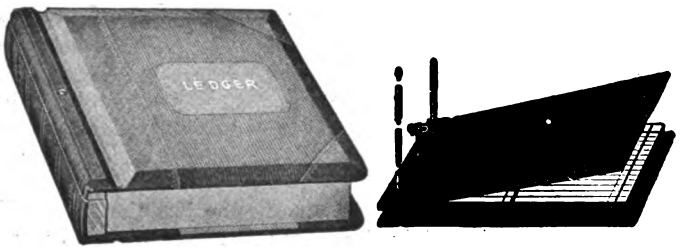


Forms Nos. 4 and 5: Form No. 4 as referred to in the accompanying article appears at the top of the illustration.

Digitized by Google

of telephony. These result in new and improved apparatus which render almost worthless some of the exchange equipment which, a few months before, was a valuable asset.

Many conservative expert engineers and managers consider that ten per cent is a fair annual reduction to make, estimating the average life of a telephone plant as not exceeding ten years.



Two Styles of Binders for General Ledger Sheets.

Instead of changing direct to investment accounts thereby reducing insurance values, depreciation can be charged to the profit and loss account, and depreciation account credited, thus showing as a liability.

NOTE.—The next article of this series will be on branch exchange reports to the general office, quite fully illustrated with forms.

HARD DRAWN COPPER WIRE.

BY T. B. DOOLITTLE.

IN an article in the *Harvard Engineering Journal* for November Thomas B. Doolittle, who, by the introduction of hard drawn copper wire contributed to so valuable an extent to the extension of the limits for the transmission of speech, gives the following interesting information:

"Hard drawn copper wire was the result of an adaptation rather than a discovery, although many of its valuable properties were not appreciated until after it had been in service several years.

It is the common knowledge of all who are familiar with the manipulation of copper that the process of drawing it into wire serves to harden the surface. Thus it will be seen that the experiments which resulted in the so-called hard drawn copper wire were based upon a well-known principle, although the application of this principle had never been made use of for the final product. The writer was familiar with this phenomenon at the time he entered the field of electricity; therefore, when it was disclosed to him that copper was not only one of the best conductors of electricity, but was the cheapest in conductivity, or per mile ohm, it was only left for him to determine whether or not this hardening process could be made available, in order that copper wire should be comparable to iron in its ability to stand the strain of its own weight when strung on poles, and, in addition thereto, the weight of sleet or snow and wind pressure. There was no mathematical road to determine this factor; therefore, it was simply a case of "cut and try."

First, the size of the finished product was fixed upon (No. 12 B. & S. gauge); then it became a matter of experiment to determine the size of the annealed copper rod which, when drawn to this predetermined size, should possess the proper tensile strength and the required torsional property. It was also necessary to determine the number of "holes" or reductions that should intervene in the process of drawing in order that the structure or fibre of the metal should not be injured during the process. Too much force would result in granulating the metal and thereby impairing its tensile strength. The experiments proved all that could be anticipated, and a sufficient amount of hard drawn copper wire was manufactured to equip the lines necessary to connect all of the mills, offices and residences of officers of the Ansonia Brass & Copper Company, in whose wire mill these experiments were made. A telephone switchboard was set up in the brass mill of that company, and an operator answered calls and made connections. This work was begun in November, 1877.

Although the product is known in the trade as hard drawn copper wire, and properly so known—as the name indicates its property of hardness and the method of manufacture—the name has no antonym or contra-term because soft drawn copper is a misnomer; the very process of drawing eliminates the quality of softness and makes it hard.

Prior to its introduction for aerial electrical conductors, there was very little, if any, call for the hard product. Copper wire was usually annealed after drawing, and sold in that form. Copper alloyed with other metals was, and is now, used in the manufacture of hard or "spring wire."

Scepticism on the part of electricians and generally in scientific circles, as to the practical value of this adaptation, prevented its being adopted to any extent, except the few circuits that the writer introduced into the Bridgeport, Connecticut, telephone exchange, until seven years afterward.

In 1884 the writer was commissioned to construct an experimental metallic circuit of copper between New York and Boston. The wire for this circuit was drawn under his personal supervision in the wire mill of the Bridgeport Brass Company. The total cost of this experiment was, in round numbers, $70,000. After the experiment was concluded, the wires were turned over to the intervening telephone companies for local use, and immediate steps were taken to build the New York and Philadelphia long distance telephone line. The miles of hard drawn copper wire now in use for all electrical purposes are counted by millions.

The first recorded employment of copper as a line conductor was its use by Prof. Morse in his experimental telegraph line between Washington and Baltimore. The ordinary market wire was used, but for the reason that it would not sustain its own weight, it was abandoned and iron wire was substituted. The next of record was strung by the Western Union Telegraph Company in New Jersey. In this case, also, the ordinary copper wire was used, but an attempt was made to increase its tensile strength by twisting a pair of wires into the form of a rope. This did not prove a success and was abandoned for the same reason as the other. In the early seventies many experiments were tried in attempts to make available for aerial line conductors the superior conductivity of copper. In each case a steel wire was employed for tensile strength. In one case a copper ribbon was wound spirally around the steel wire. On exposure to the elements a chemical action was set up that quickly destroyed the steel core. This ribbon was afterward tinned, but with unsatisfactory result. In another experiment the copper ribbon was folded longitudinally. The last and most successful in this line of experiment was the process of electroplating the steel wire with copper. This was put in service by the American Rapid Telegraph Company, but in a few years it also proved unsatisfactory and was abandoned. Therefore it will be seen that the first successful employment of copper wire for electric line conductors was on the telephone lines of the Ansonia Brass and Copper Company in 1877, and the Bridgeport, Conn., telephone exchange in 1878. The next was on the line between New York and Boston in 1884. The latter experiment was an immediate success, and hard drawn copper wire was, within a few months, adopted throughout all civilized countries.

(*To be continued.*)

ASSUMPTION OF RISK BY EMPLOYEE.

THE Home Telephone Company of Indiana was sued by Earl T. Shaver in the Clinton County Court for damages received in an accident. Shaver was employed with others in unloading telephone poles from a flat car. The poles had been loaded lengthwise and piled up about eight feet high, and were held in place by three standards on each side of the car, which were stayed in pairs with a wire crossing the car. The said wires were cut except the one binding the center standards. Shaver was ordered by the foreman to cut the wire holding the center standards, and on having done so a standard broke and the poles rolled off the car and struck him. The court held that he had assumed the risk and could not recover damages. Shaver v. Home Telephone Co., 75 N. E. 288.

QUERIES

CROSS-TALK FROM GROUNDED TO METALLIC LINES.—(641.)

I have a metallic circuit that is 22½ miles long, and which has a running transposition every mile. There is a grounded circuit on the same arm that parallels this line for eighteen miles, also another that runs parallel to it for eleven miles. The cross talk on the metallic line is just as bad as when it was a grounded line. Is there any way that it can be made less without making the other two lines metallic? C. C. V.

The cross-talk can be much reduced by increasing the number of transpositions until the distance between two adjacent transpositions is a quarter of a mile. The transpositions should be so located that the first eleven miles of exposure is carefully balanced, and likewise the next seven miles. It is just as important that the transposition be properly and accurately located as it is that there be a sufficient number. The first transposition should be one-eighth mile from the first pole, and the second three-eighths of a mile from the first pole; the third five-eighths of a mile and so on at quarter-mile intervals.

There will be 44 transpositions in the first eleven miles and it will be one-eighth mile from the last transposition to the eleven-mile point. The first transposition beyond the eleven-mile point will be one-eighth mile distant and then transpositions will occur at quarter-mile intervals as before and there will be 28 transpositions in the next seven miles. The last four and one-half miles may as well be transposed every quarter mile if there will be parallel grounded lines in the near future; if there are no circuits of any sort near the metallic circuit in this four and one-half miles, one or two transpositions will be sufficient.

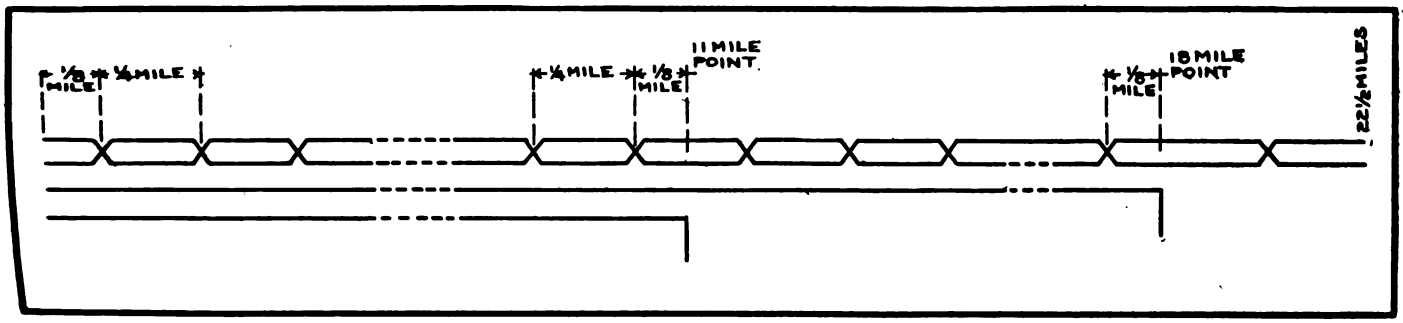

Fig. 641.

If there are any intermediate telephones on any of the three lines, they should be connected at points midway between two transpositions. If the latter is not feasible, the transpositions may be shifted so as to balance the exposures, but in this case you would better submit to us a diagram giving details of the entire lines.

The accompanying figure 641 shows the above method of transposing clearly. If the data given do not completely satisfy your requirements, please submit a detail diagram and map showing all lines and stations.

NUMBER OF MULTIPLE LINES.—(642.)

I understand that it is customary in estimating the number of multiple jacks to install in a switchboard, to put in a certain percentage more than the estimated number of lines expected in the period which is supposed to elapse before it will become necessary to add new equipment. As all possible allowances are made when estimating the number of lines, I fail to see why it is necessary to add still further to this number; that is to say, why is it that the traffic estimate is not questioned, but the additional multiples are put in just the same? C. R. L.

The additional multiples are put in to provide for unoccupied lines which must always be present in every well-arranged multiple switchboard. Your traffic estimate of the number of lines covers only the number which are supposed to be actually connected to the board and working at the conclusion of the period covered by the estimate. As a certain number of jacks must be assigned to groups to provide for additions, etc., it follows that there must always be many unoccupied jacks. An instance of this occurs when a private branch exchange is assigned several adjacent jacks for trunk lines, even though the number of trunks to be installed at the time the branch exchange is cut in service may be very much less than the number laid out to provide for growth. In addition to this there will usually be several jacks which must be idle for a time owing to a change of number or disconnection. In the case of either of these events it is very poor policy to immediately assign the old number to a new subscriber. This would mean that every person calling for the number with the expectation of obtaining connection with the old subscriber would obtain the one who had been most recently connected. Explanations would be necessary, the operator would have to be again called in on the circuit and recourse had to the information desk, or, in a smaller exchange, the chief operator, to obtain the correct number of the person with whom connection was desired. The result would be annoyance to both the calling subscriber and the one who had been assigned the recently vacated number. In addition to this the labor and cost of handling the call would be much increased. It should be evident from this brief recitation that it is necessary to provide for a certain proportion of vacant multiples, and this number will appear as the excess above the traffic estimate of the number of lines to which you refer.

TYPE OF MAIN DISTRIBUTING FRAME.—(643.)

In some offices the cables from outside the building are terminated upon the horizontal side of the main distributing frame, and those from the switchboard go directly to arresters on the vertical side. In others this arrangement is reversed. Can you tell me why this is so? A. F. D.

This is a matter which is determined wholly by local conditions. It is usually conceded that testing facilities are in favor of the frames in which the line cables terminate at the arresters, owing to the fact that in this case the arresters are on the side of the frame nearer the center of the room. The most important considerations, however, are those of space and cost. In taking up the question from this standpoint it is necessary to remember that the number of terminals on the cable side will be from thirty to fifty per cent. higher than the number on the switchboard side. The arresters cost much more than terminals on the horizontal side of the frame. It will therefore be evident that terminating the line cables on arresters increases the expense for this portion of the equipment by an amount proportional to the excess of the number of outside pairs over the number of lines in the multiple.

HEAVY SERVICE INSTRUMENTS.

AT the coming electrical show in Chicago there will be exhibited types of telephone instruments which are so widely separated in appearance, and in the conditions of their usefulness, that they will seem to mark a wide divergence of two paths open for the development of apparatus. There will be small, compact telephones, with few parts, designed for common battery service in the larger towns and cities. Contrasted strongly with these will be instrument cases holding heavy magneto generators, long coil bells, and even boxes for holding batteries within the instrument case itself.

These latter instruments are among the most logical successors of the early types of magneto telephones. A few years ago they would have been useful on ten-party lines in magneto exchanges. Nevertheless, at that time, when there was a strong apparent demand for an instrument with a generator capable of ringing on a heavily loaded line, and with a bell responsive to very small currents, none was at hand. Since that time conditions of telephone service in closely settled districts have changed widely. Automatic calling has brought about the banishment of the generator at the subscribers' station, and the party line itself seems to be moving out of the field.

It becomes evident, therefore, that the development to a high state of practical perfection of a type of instrument which has continued for years in an almost constant state of moderate power and efficiency is due to some extraordinary demand. This urgent need is due to the growng appreciation of the advantage of the telephone in rural communities. The local conditions in many places make party lines especially desirable, aside from the fact that they may be constructed and operated with extreme economy. It is fortunately true that amongst the instruments designed for this class of service there are many which meet all requirements of operation on lines to which are connected many individual subscribers.

THE DISTRIBUTION OF LINES.

MUCH time is being spent by telephone managers in the training of operators, with the object of causing them to attain the highest efficiency in the performance of the work of handling calls. When we say that an operator is efficient, we mean that she not only handles a great number of calls in a given interval, but is attentive to the details of each call, giving prompt, clear responses, offering each subscriber all attention consistent with the speedy performance of her work, and making all connections with accuracy. We believe it is generally recognized that an operator working at a certain determined high rate of speed gives better service than one whose position is insufficiently loaded. This is said to be due to the fact that when working under the pressure produced by the necessity for handling a large number of calls in a short time her mind is more alert, her eyes and hands more accurately directed, and she passes more rapidly from each step to the next in sequence. It has been found that any load less than this critical figure for each individual leads to a lowering of the standard as viewed from the subscribers' standpoint, as well as to the raising of the cost of each connection. Thus the satisfaction afforded to the subscriber by the receipt of good service is diminished, at the same time that the economy of operation is reduced. On the other hand, an overload brings about the slurring of details, long delays for some calls, and general inaccuracy, which produce a most unsatisfactory impression upon all subscribers.

Realizing the importance of keeping the exchange load so steady, and of such dimensions at each position, that the ideal condition of a satisfactory load on each operator, of such size as will enable her to do her best work, may be realized, many companies have carried on extensive traffic investigations. The object of these investigations has been to so distribute the subscribers' lines that the number of calls upon each operator will approach the proper figure throughout each hour of the day. This does not mean the number of calls at each position, as the ability of operators to produce results by efficient team work makes it essential to arrange the lines to provide for this method of handling the business. Moreover, the fact that rates of calling much lower than the maximum prevail during the greater part of the day makes it necessary to leave certain positions blank. It is necessary to provide for the handling of calls terminating at these positions by the operators at adjacent, occupied positions. This condition introduces an additional complication, which, however, does not affect the preliminary, most difficult and most essential step in the work of bringing about a thoroughly desirable arrangement of lines.

In cases where this has been brought about in the most satisfactory manner, the subscribers have been classified in lists, which depend to a certain extent upon the nature of the business of each telephone user, and also upon the districts in which the telephone is located. It has been found that with such classifications, based upon sufficient experience, and a sufficient number of tests to give data for definite conclusions, the average number of calls per day, and the average number made during each hour of the day by the subscribers of a given class, will be found to come very close to a constant quantity, which may be taken as a standard. After this quantity has been ascertained, the plotting of curves for the different classifications gives graphical results which may be utilized to indicate the method of distributing the exchange load to secure the maximum efficiency. This distribution is readily effected by making proper cross connections at the intermediate distributing frame.

It is evident that the essential factor in this process of arrangement is the correct classification of subscribers, and this can only be accomplished after sufficient tests have been made on representative lines belonging to each class to get thoroughly reliable results. As conditions vary so widely in different cities, it is necessary that each manager should determine his own figures. The carrying on of this work has brought out many points which are extremely valuable, as it has such a direct bearing on the two most essential features of central office operating. Its satisfactory accomplishment increases the value of the service to the subscriber at the same time that it reduces its cost to the company. It is to be expected that at the present time, when the value of this branch of telephone work is becoming so well understood, that every exchange manager will devote to it the attention which it deserves. The result of general interest and study with the free communication of results obtained under various described conditions should raise the general understanding of the problem to a point, where a telephone exchange manager will be able to predict the load on a given position at a given time of day with even greater accuracy than that attainable by the manager of a modern electric lighting or street railway plant.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. MCMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

EXPENSE OF HIGHER POLES RECOVERABLE FROM STREET RAILWAY COMPANY.

A street railway company has built its poles on both sides of the streets in such a way as to compel us to erect higher poles at considerable extra expense. We are authorized to do business in the city and had our poles in the streets first. Can we recover the expense of changing our poles from the street railway company? P. E. L.

IT has been held in similar cases that a telephone company can recover from a street railway company the expenses incurred by it in erecting higher poles to prevent its wires from conflicting with those of the railway company. Cumberland Telegraph & Telephone Company v. United Electric Ry. Co. (Tenn.), 29 S. W. 104.

PROTECTION OF RIGHT TO USE EARTH FOR RETURN CIRCUIT.

Our telephone company had been using the earth for a return circuit in the streets of the city for fully ten years under a franchise that was legal and undisputed. At the end of that time permission was given an electric railway company to use the streets. The railway company uses a single trolley wire and also uses the earth for a return circuit. The result is that our telephone wires have become charged with electricity and practically useless. Either company could obviate the difficulty by using a different system at an increased expense, but we do not feel it our duty to put up the extra money because our rights are the older. What remedy would you suggest? O. B.

AN injunction would lie to restrain the electric railway company from interfering with your rights, and it could thereby be required to adopt a system that would not impede the operation of your line.

LIABILITY OF COMPANY FOR FALSE IMPRISONMENT CAUSED BY ITS AGENT.

THE American Telephone & Telegraph Company was extending its line in Cumberland County, N. C. In attempting to erect its poles across the line of one L. C. Jackson a dispute occurred which finally resulted in Jackson bringing suit against the company to recover damages for false imprisonment. He alleged that one McManus was the agent of the company and that he caused a warrant to be issued for Jackson's arrest upon the charge of an assault with a gun and that he was taken into custody by the sheriff and confined in jail about a day. The company alleged that it had two departments, the right of way and the construction departments, and that McManus was assistant foreman and employed by the foreman of the construction department; that Jackson assaulted McManus with his gun and that the arrest had nothing to do with the work of the company and was not authorized by the company or any of its agents; that Jackson signed a "voucher" in the regular form giving the company the right to build, operate and maintain its line on the land, stating that it was his wife's property and afterwards claimed the land as his own and refused to carry out the agreement. Jackson obtained a verdict against the company and the case was appealed to the Supreme Court, the principal question involved being whether McManus was the agent of the company or not. The court held that in passing on the question of agency it was proper for the jury to consider any of the acts of the alleged agent in connection with the defendant's work and whether such alleged agent was in charge of defendant's work with authority. It further held that the fact that an assistant foreman was employed directly by the company's foreman did not render the assistant foreman any the less the company's agent. The act of a servant of a telephone company in causing a land owner to be unlawfully arrested for the purpose of putting him out of the way, so that the company's agents and servants might erect poles on his land, is an act done in the course of the company's employment and in furtherance of its business for which the company is responsible. The plaintiff's judgment was accordingly affirmed. Jackson v. American Telephone & Telegraph Company, 51 S. E. 1015.

LIABILITY OF COMPANY TOO REMOTE.

THE Rochester Telephone Company at Wabash, Ind., has just won a curious case, defining as the decision does the limitation of the liability of similar corporations for injuries. The plaintiff in a suit for damages was Mrs. John Flinn, who demanded $10,000, alleging that her husband was killed by a flash of lightning which struck the telephone wire, burned off the wire and insulation and allowed the ends to fall across a barbed wire fence. At a pig pen, fifty feet from where the wire terminated, Flinn was standing, leaning on a rail fence that joined the wire fence, his distance from the toll telephone line being seventy yards. Judge Benetha of the Marshall Circuit Court held that the liability of the telephone company was too remote and dismissed the suit.

LIABILITY OF TELEPHONE COMPANY FOR INJURIES FROM LIGHTNING.

SINCE our last discussion of the liability of telephone companies for injuries arising from lightning conducted over their wires, several interesting and important cases on the subject have been called to our attention. We will refer to these briefly in order that this subject may be better understood, as we have had a number of inquiries concerning it from time to time.

A telephone company having reasonable grounds to apprehend that lightning will be conducted over its wires into the house of a subscriber, and there do injury to persons or property, must exercise due care in selecting, placing and maintaining, in connection with its wires and instruments, such known and approved appliances as are reasonably necessary to guard against such accidents. Griffith v. New England Telephone & Telegraph Co., 72 Vt. 441, 52 L. R. A. 919.

Attaching a telephone wire to a flagstaff on a barn without the owner's consent or knowledge, and leaving it connected only with a pole on another building, renders a telephone company liable for the burning of the barn by lightning conveyed by the wire over the pole on the other building. Jackson v. Wisconsin Telephone Co., 83 Wis. 243, 26 L. R. A. 101.

Injury caused by electricity generated by a thunderstorm in a telephone wire which was negligently allowed to hang across a highway so low that a traveler came in contact with it in the dark, renders the telephone company liable, as the wire furnished the means by which the dangerous force was communicated and the injury caused. Southwestern Telephone & Telegraph Co. v. Robinson, 2 U. S. App. 205, 16 L. R. A. 545.

The doctrine of *res ipsa loquiter* was applied in the following cases: Hayes v. Raleigh Gas Co., 114 N. C. 203, 26 L. R. A. 810; Alexander v. Manticoke Light Co., 209 Pa. 571, 67 L. R. A. 475.

IN THE OPERATING FIELD

TERRE HAUTE COMPANY TO EXTEND ITS UNDERGROUND SYSTEM.

THE Citizen's Telephone Company, Terre Haute, Ind., submitted to the Board of Public Works for its inspection an agreement the company proposes to enter into with the city for the right to extend its underground conduit system in the immediate future.

The present system of the company extends along the principal streets of the city. While the proposed extension will practically cover all the business portions, trunk routes will carry the main leads, which will be tapped at desirable points for lateral runs. The proposed system will do away with a large number of poles now used by the company.

In case the agreement is entered into the work on the extension of the conduits will be undertaken at once. It means an outlay of at least $35,000.

In the contract with the city the Citizen's Company agrees to give the city the use of a section of the conduit for its fire and police alarm wires.

ROCHESTER STOCK EXCHANGE LISTS INDEPENDENT SECURITIES.

THE governing board of the Rochester Stock Exchange held a meeting recently and decided to list the securities of the United States Independent Telephone Company. These securites will be traded in on the exchange. The amounts listed and issued are, in bonds, $12,715,000, and in stock, $5,086,000. The stock listed is only the 40 per cent. that was to go with the bonds of the new company.

That the Rochester Telephone Company will be a part of the United States Company is now assured. Albert O. Fenn, of the Alliance Bank, who has acted as agent for the company, in a recent statement said "that nearly all of the stock of the telephone company had been turned in for securities of the United States Company."

NEW INDEPENDENT TOLL LINE IN NEW YORK STATE.

INDEPENDENT development throughout the State of New York has been very rapid. The whole of the Western and Northern parts are covered with exchanges and toll lines for interconnection between the towns within the State. In addition to these long distance lines reaching into Pennsylvania, New Jersey and Ohio have been built and are now being augmented with new circuits to handle the ever increasing business. One of the most recent additions to this network of Independent circuits is a toll line which connects with the towns of Clinton, Plattsburgh, Champlain, Mooers, and Rouses Point. In this territory there are upwards of a thousand subscribers, who will be benefited by the new circuit. The rates are low and consequently the traffic is heavy. In all probability new lines will have to be added to take care of the growing volume of business.

TERMINAL COMPANY OF DES MOINES INSTALLS NEW SWITCHBOARD.

THE Mutual Terminal Telephone Company of Des Moines, Ia., is installing a new switchboard which involves the expenditure of about $10,000. The company expects to be using the new board within a short time.

The telephone companies associated in the Mutual Terminal Company are the Hawkeye, the Jasper County Telephone Company, the Boone County Telephone Company, the Knoxville Electric Company and the Southern Iowa Telephone Company. All these companies have a working agreement whereby the lines of each company can be used for long distance service. A very large number of the farm lines throughout the State are managed by these five companies, and it is to improve the service to be received by these as well as by its own subscribers that the new equipment is being installed by the Mutual Company.

CONSOLIDATION OF INDEPENDENT COMPANIES IN OHIO RECENTLY EFFECTED.

PRESIDENT FRANK L. BEAM of the Ohio Independent Telephone Company, assisted by Dwight E. Sapp of Mount Vernon and by Columbus and Marysville capitalists, has succeeded in organizing all the Independent telephone companies in Union county, of which Marysville is the county seat, into one organization, which is named the Union County Telephone Company. Several other county exchanges have been organized under the plan, and it is proposed to organize other counties in a similar manner and merge them into an Ohio Independent telephone company. This is to be a general holding company for many county and local telephone companies, which will be a power in the telephone business of the country.

NEW PLANT OF CORN BELT COMPANY WILL SOON BE IN OPERATION.

A FEW months ago Stanley S. Lichty and J. H. Shoemaker of Waterloo, A. F. Averill of Cedar Rapids, together with a few other parties in Waterloo, purchased from T. Cascaden and F. F. McElhinney the telephone exchange at Waterloo, Ia., in the name of the Corn Belt Telephone Company. Immediately after taking possession an entire reconstruction of the system was started, which included laying of underground cable, erection of a new building and the installation of a new switchboard.

The building is brick, two stories in height. On the lower floor are the general offices and on the upper floor are the operating and retiring rooms. The switchboard has a present capacity of 2,000 lines, which can be increased as business warrants. It is of the common battery type and is finished in walnut. The operators' retiring room is tastefully finished and is provided with rocking chairs, reading table and a lounge. On the floor is a moquette carpet and pictures adorn the walls. The present operating force will include a chief and ten operators. The Corn Belt Company covers the country in the neighborhood of Waterloo and connects with upwards of 300,000 subscribers in different parts of the State.

IMPORTANT CONSOLIDATION OF INDEPENDENT PLANTS TAKES PLACE IN KANSAS.

BY a recent transfer all the property, franchises and all other rights and emoluments of the Home Telephone Company of Parsons, Kan., became the property of the Citizens' Home Telephone Company. This brings under a single control the telephone exchanges at Parsons, Pittsburg, Oswego, Chetopa, Altamont, Mound Valley, Edna and Bartlett, practically covering the county with a network of wires, while the company's toll lines cover the entire southeastern part of the State, giving communication with Kansas City. A copper wire is already operating from Oswego by the way of Coffeyville and Chetopa to Independence and the wire is now at hand for other connections that will be made shortly, enabling the Parsons subscriber to sit in his office and talk with Kansas City without the additional expense of a messenger. The company is capitalized for $500,-

Digitized by Google

000, with Jas. A. Platner, the former owner of the Pittsburg exchange, president; George H. Spangle, secretary and superintendent of equipment, and C. H. Kimball, treasurer. With the new company embracing as it does a large territory and with new equipment of the most improved kind, which has just been installed, there is every reason to believe that the service of the new exchange will be all that the people can desire.

EXHIBITS FOR CHICAGO ELECTRICAL SHOW ARE NOW WELL UNDER WAY.

MILLIONS of dollars will be represented in the Electrical Show to be held in the Coliseum from January 15 to 27. In fact, never before in the history of Chicago has there been an array of exhibits which represented so many and such wealthy and influential concerns. In the list of firms which have already entered for space, there is not one of the larger electrical companies missing. Up to December 20, 1905, the number of firms who had contracted for space was 113, and over half of this number will have exhibits of direct interest to telephone men.

On January 14, the day before the formal opening of the exhibition, the Sunday Chicago *American* will print a specially arranged and designed four-color supplement, containing from 12 to 20 pages. This will be devoted exclusively to features of the show. A circulation of over 600,000 copies is guaranteed for this special edition.

Numerous representative telephone men from different parts of the country have expressed their intention of visiting this show. The great attention paid by the manufacturers to their exhibits will make it an extremely instructive, as well as a pleasant affair. In addition to the regular features telephone men have been invited to take advantage of their visits to Chicago to hold conventions and meetings for the discussion of matters relating to the development of telephony.

There are to be no fakirs in the electrical show. The management has refused to sell space to hundreds of people who desired to profit from the expected crowds, but everything that is not identified with the electrical field and electrical developments is barred.

During the two weeks of the show there are to be several special days. The 200th anniversary of Franklin's birth will be observed on Wednesday, January 17, and bronze medallions are to be distributed as a souvenir of the occasion. The Northwestern Electrical Association will meet at the Great Northern Hotel, January 17 and 18, attending the exposition in a body the second night of the convention. The telephone men will be specially cared for January 22, 23 and 24. One day will be set apart for the technical classes in the schools and colleges, many of which will send large delegations to Chicago. Purdue has already decided to send a trainload of students. Many of the colleges in the middle west are making exhibits.

The management in its desire to be absolutely up-to-date and new in everything, has engaged Weil's Band of St. Louis to give afternoon and evening concerts during the show. This was the official band at the St. Louis Exposition, and has never been heard in Chicago.

MUNICIPAL OWNERSHIP PLANS IN CHICAGO INCLUDE TELEPHONE SYSTEM.

It is rumored that Mayor Dunne, of Chicago, will immediately after the holiday recess urge that steps be taken toward the municipalization of the telephone system.

It is said that in the Mayor's recent negotiations with the representatives of the Chicago Telephone Company he did not lose sight of the opportunity to indicate his wish that, in any future agreement between that corporation and the city, there should be inserted in the contract a provision stipulating that the municipality might take over the lines and plants of the company whenever the Legislature shall have passed the necessary enabling act.

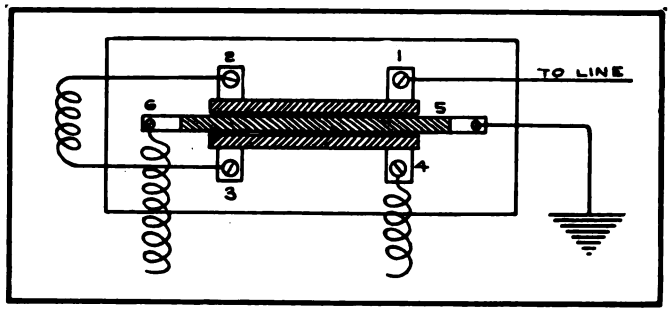
It is announced that Mayor Dunne will not only use every endeavor to secure an iron-bound contract with the telephone company looking toward municipalization, but during the next year he will agitate the desirability of passage by the Legislature of the requisite enactment.

If this were actually brought about it would involve the amusing possibility of making the City of Chicago a sub-licensee of the parent Bell Telephone Company, owing to the taking over of the system of the Chicago Company, which at present maintains that relation.

A LIGHTNING ARRESTER SCHEME.

By G. R. Morris.

WHERE a grounded line is employed I have found the following scheme for connecting the circuit to a No. 400 type lightning arrester to give excellent results: Bring the line wire to post 1, then connect posts 2 and 3 together through a wire coil. Run the ground wire direct to post 5, con-



Connections of Lightning Arrester for Use on Grounded Line.

nect the instrument to posts 4 and 6 through coils, as shown. The object of the coils is to prevent lightning taking a path to the instrument. The coils offer a path of very high self-induction to the rapid oscillations of the lightning discharge. In consequence, the discharge takes the easier path across the air gaps to the ground carbon and thence to earth. By wiring up the arresters in this way, I secure a greater arcing space for the carbons than if only one side is connected up, and they don't appear to give off as much dust when a discharge takes place.

CONVENTION OF ELECTRICAL SALESMEN TO BE HELD DURING CHICAGO SHOW.

ON January 20, 1906, will occur the first regular meeting of the American Electrical Salesmen's Association, at the Grand Pacific Hotel, Chicago. This association was organized at Peoria, Ill., October 5, 1905, with thirty-five charter members, and will be actually launched at the next regular meeting this month, with over a hundred members who will respond to roll call.

So great has been the interest shown by the members that it will be safe to say that at this meeting fully three hundred salesmen will attend. A programme has been arranged which will contain the names of such prominent speakers as J. Robert Crouse, of Cleveland, and R. C. Lamphier, of Springfield, Ill., who will tell the members things of vital importance regarding salesmanship. A most interesting meeting is expected, and one that will be valuable to all members of the organization.

The purposes of this association are: First, good fellowship; second, the making of more efficient salesmen; and third, the advancement of the electrical industry in general. The great aim which the organizers had in view when this movement was started was simplicity of obligations upon its members and a set of bylaws have been devised which impose few restrictions.

More information concerning this association can be obtained by writing to the secretary, George H. Erich, 88 Washington street, Chicago, who will gladly furnish application cards, copies of by-laws, etc., upon request.

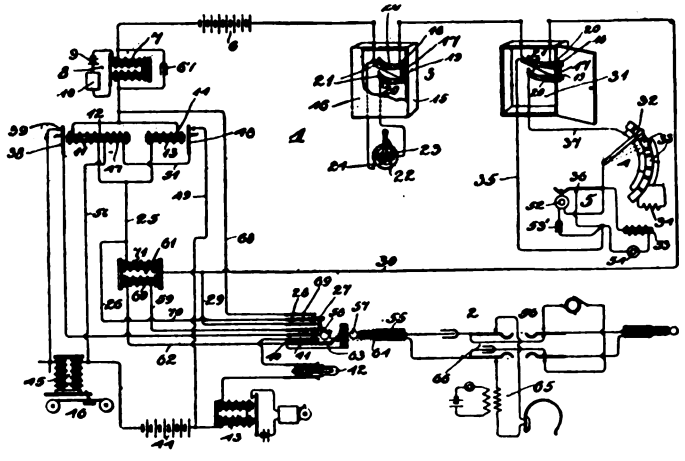
TELEPHONE PATENTS

ALARM AND TELEPHONE SYSTEM.

Garrison Babcock, Chicago, Ill., patents (No. 807,235; dated Dec. 12, 1905; filed Dec. 14, 1903; serial No. 185,090) an alarm and telephone system.

This invention provides a means whereby fire alarm and police signals can be transmitted over a telephone line. In the illustration, 2 is a central exchange, 3 a fire alarm station, 4 a police signal station, and 5 telephone apparatus. All this is included in a normally closed circuit with a battery 6, and relay 7, which



is adapted to open and close an alarm circuit 8, including a battery 9, and receiving and recording instrument 10. Windings on relays 12 and 14 are also included in the line circuit. Opening the cover of the fire alarm signal 3, withdraws the bridge contact piece 17 and carries the contacts 20 to open between contacts 18 and 19 and other contacts 21 connected with interrupter 22. This alternately opens and closes the circuit. Relay 7 is actuated and closes its circuit giving signal by indicator 10. For reasons to be described no other signal apparatus at the exchange operates. A police code signal is sent in as follows: Alternate contacts 33 are closed through resistance 34 to line 37, others are connected direct. Moving line 32 over these contacts on some points closes the circuit directly, and on alternate contacts, through a resistance. Tracing the circuit from battery 6 it follows the same path as the fire alarm circuit to bridge contact 20 of the containing box of the police signal mechanism, to conductor 35, switchhook 36, lever 32, alternate contacts, wire 37, and back to battery through bridged contacts of fire alarm signal box. Relays 7, 14 are gauged to release their armatures only when the current flow is broken, hence the fire alarm mechanism will not be operated, but the winding 11 of relay 12 is more delicate, and a slight decrease in current strength causes it to release its armatures which then closes a local circuit including a magnet 45 for controlling recording apparatus, battery 44, relay 43, lamp 42, jack springs 40, 41, the fluttering of the lamp notifying the operator of a police signal.

As the windings 11, 13 are in parallel, to prevent the release of armature 13 when a fire alarm signal is sent in, an additional winding 47 is provided. The release of armature 48 closes its circuit through battery 44 and thus armature 38 is inoperative. When calling by telephone the current is completed through the transmitter 54 and retardation coil 53, the main circuit being open at the lower hook contact. This causes a sufficient weakening of the current to operate relay 12, but the recording signal 42 will be permanently instead of intermittently illuminated, and thus the operator is notified of a connection. Plugging into the jack she opens the signal circuit at springs 40, 41, 27, 28 and completes a local circuit through winding 60 of repeating coil 61. Transmission from the telephone 5 is accomplished as follows: Battery 6, relay winding 7 shunted by condenser 67 to overcome its impedence, conductor 68, jack springs 69, 27, conductor 70, primary winding 71 of repeating coil 61, conductor 30, bridge contact 20, conductor 35, then in parallel through receiver and transmitter circuits to arm 32, conductor 37, bridge contact 20 back to battery.

An examination of the drawing will show that conductor 68 shunts windings of relays 12 and 14, thus removing the impedance for telephone purposes.

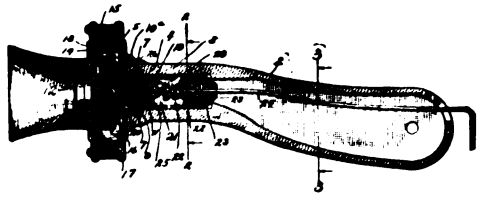
The various claims embodied in the patent broadly cover the application of the principles involved in the above circuits to the combination of fire and police alarm signals to telephone circuits.

TRANSMITTER AND ARM CONNECTION.

Ernest E. Yaxley, Chicago, Ill., patents (No. 807,528; dated Dec. 19, 1905; filed March 18, 1901; serial No. 51,809) and assigns to American Electric Telephone Company of Chicago a transmitter and transmitter arm connection.

In this invention means are disclosed for the construction of a transmitter and specially designed transmitter arm which are said to overcome difficulties met in securing good electrical connection between the usual type of transmitter head and arm and between the contacts of the conductors forming the other side of the transmitter circuit.

For this purpose the transmitter arm 2 is given a cylindrical shape 3, and adapted to receive an annular flange or tubular bore 4, attached to or forming a part of the back of the transmitter head 5. This cylindrical portion is split lengthwise, the two portions being held together and clamped by screws passing through the opening 7. The boss of the transmitter head is provided with an annular groove 11 so placed that it is impossible to withdraw the head without removing the screws. To the rear electrode of



the transmitter is attached a contact pin 19, which presses against a spring supported terminal seated in an insulating washer 23. To this terminal the insulated connecting wire is attached. This construction permits rotation of the transmitter head to prevent packing of the carbon granules as the adjustment of the clamping screws may be such as to permit a revolving movement of the head under a certain amount of tension which will not affect its electrical conditions. It is further claimed that a more reliable contact is obtained than with the usual set screws.

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

A SECRET SERVICE SWITCHBOARD.

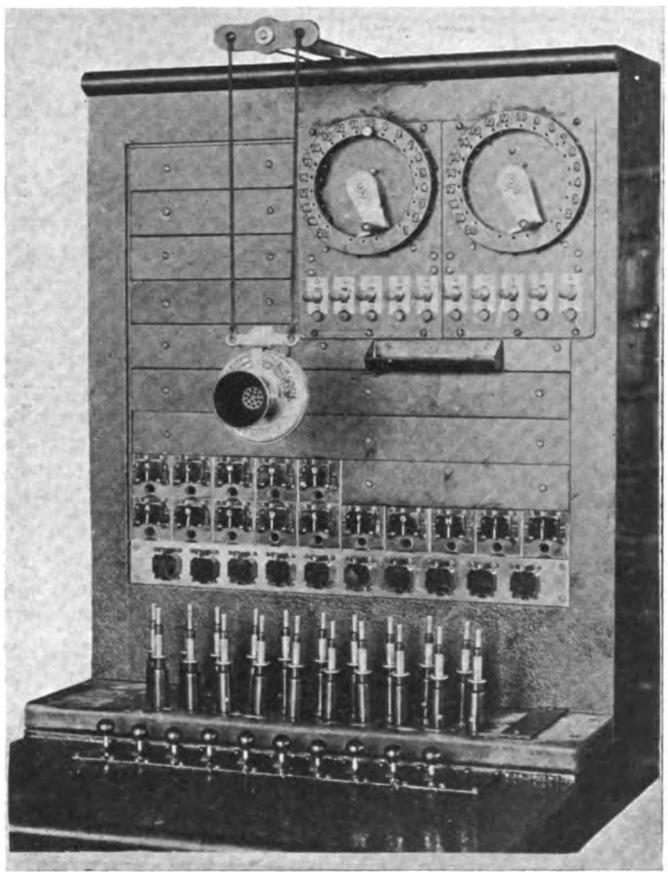
THE accompanying illustration shows the rural line board recently designed for the Citizens Telephone Co. of Decatur, Ind., by the Baird Manufacturing Co., 6 Michigan street, Chicago. This switchboard is equipped to take care of 15 rural lines as shown by the drops lettered "A" to "O." Each of these lines has a capacity of 19 telephones, making a total capacity of 285 instruments, each of which, by virtue of the lockout system, enjoys the same privacy as an individual subscriber on an individual full metallic circuit.

The calling devices shown in the upper right hand corner operate the lockout mechanism of the various telephones on the line and are connected into the cord circuits of the switchboard in such a manner that one calling device is sufficient to take care of all the calls an operator can handle with five pairs of cords.

There is no connection between the instruments on the line and the calling device until the operator plugs in, the calling device being connected into the cord circuit and not the line circuit.

Six months ago the Decatur people had 10 of the secret service instruments in use. To-day they are using 130 and equipping their exchange to take care of double their present facilities.

The growth of the Baird Manufacturing Company's business in this line of telephones in the face of the many unsuccessful attempts to develop a practical working lockout telephone system clearly shows that its apparatus must have substantial merit.



Baird Secret Service Switchboard.

VINTON A. SEARS, of Boston, Mass., who some months ago resigned from the various automatic telephone companies in Massachusetts, has moved to the Sears Building, Boston, where he will continue to be interested in Independent telephone work and securities. He will, however, be independent of any particular system of telephony. Mr. Sears organized the Automatic Telephone Companies at New Bedford and Fall River, Mass., which were the first in the world to demonstrate the feasibility and practicability of the automatic or "girlless" system. Mr. Sears is the author of that well-known book "Telephone Development, Scope and Effect of Competition," the second edition of which required 5,000 copies for this country and Europe.

THE STERLING ELECTRIC COMPANY seems to have its motto, "Once a customer, always a friend," well borne out by the large number of repeat orders it daily receives from old customers. The following partial list of orders for additional switchboard equipment, not only indicates well satisfied customers, but a prosperous condition of affairs in the Independent field generally: Hudson, N. Y.; Seymour, Ind.; Beverly, Kan.; Saginaw, Mich.; Elizaville, Ind.; Wolcott, Colo.; La Grange, Mo.; Shelbyville, Ind.; Huntsville, Texas; Brookville, Pa.; Mt. Vernon, Ind.; Mulvane, Kan.; Max, Ind.; Elkhart, Ind.; Charleston, Ill.; Bloomington, Ind.; Smithland, Ky.; Fedora, S. D.; Champaign, Ill.; Kentland, Ind.; Hallsville, Mo.; Boswell, Ind.; Terre Haute, Ind.; Robinson, Ill.; Earlvile, Ill.; Defiance, Ohio; Sioux Falls, S. D.; Pittston, Pa.; Wilkesbarre, Pa.; South Raub, Ind.; Cheboygan, Mich.; Abilene, Texas; Clarksville, Tenn.; Yankton, S. D.; Rantoul, Ill.; Henry, Tenn.; Hamilton, Mo.

THE DEAN ELECTRIC COMPANY of Elyria, Ohio, has received two orders for complete common battery central office equipment and telephones from California, one for the Corona Home Telephone Company, Corona, Cal., and the other for the Compton Home Telephone Company, Compton, Cal., the former being equipped with a complete Dean harmonic 4-party line ringing system, including Harmonic Converters, while the latter is supplied with individual indicating ringing keys and ringing machines for 2-party selective ringing. The company also reports that the United States Army Signal Corps has in addition to the five hundred field telephones recently ordered, placed an additional order for two hundred telephones, one hundred and fifty of which are of the Dean standard Fourteen Twenty Type local battery style, while the remaining fifty are the standard Dean local battery desk stands. The Government also has ordered two switchboards of a new type.

THE F. BISSELL COMPANY, Toledo, O., has recently issued a small booklet entitled "Securities." In it are illustrated several types of "Security" cable pole houses, cable distributing panels, fuses, distributing rings and many other appliances, the uses of which, in both aerial and underground construction, are well known. As indicated by the title of the book, especial attention is given in the apparatus described to the securing of sufficient strength to safeguard the workman. The descriptions are very complete and thoroughly illustrated, and the book is well worth the attention of all managers interested in obtaining the best construction of their wire and cable plants.

THE CENTURY TELEPHONE CONSTRUCTION COMPANY has been making an increase in the capacity of its factory, which will enable its output to be doubled. Some of its recent shipments are as follows: Telephones and two switchboards to the Patrons Telephone Company of Fulton, N. Y.; switchboards and telephones to the following: Citizens Telephone Company of Little Valley, N. Y.; Attica Telephone Company of Attica, N. Y., and the Williamsville Telephone Company of Williamsville, N. Y. Also a complete central office equipment to the Weedsport Telephone Company of Weedsport, N. Y.; switchboard to the Springville Telephone Company of Springville, N. Y., and also to the Hamburg Telephone Company of Hamburg, N. Y.; complete central office equipment to the Rush Telephone Company of Rush, N. Y. It is also building a multiple, common battery lamp signal switchboard for the Livingston County Telephone Co. of Dansville, N. Y., and for the Citizens Tel. Co. of Bath, N. Y. Both exchanges will have the Century Four Party Selective System.

IN THE MANUFACTURING FIELD

A NEW TRANSMITTER.

THE requirements of the Independent telephone service are now so extended that the necessity in all plants for a transmitter capable of being used indiscriminately over both short and long distances with the best possible results is evident to every manager who gives any thought to the subject.

The Stromberg-Carlson Telephone Manufacturing Company of Rochester, N. Y., has just designed a new transmitter which is said to give soft and pleasing transmission over short distances, and still be capable of transmitting speech over very long lines with the least possible exertion on the part of the speaker.

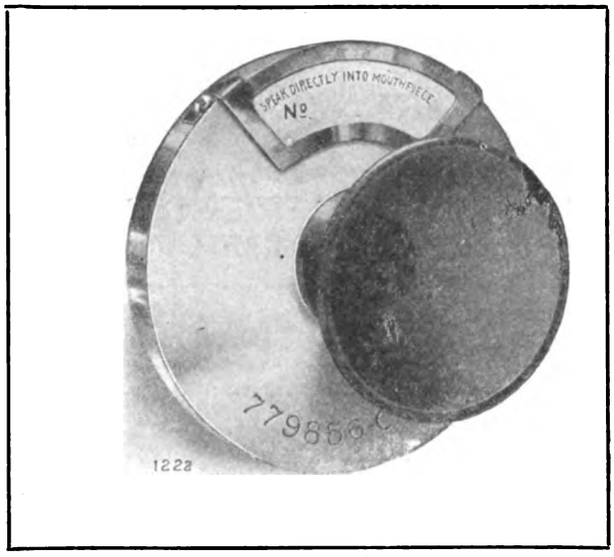

Fig. 1. Front view of new Stromberg-Carlson transmitter, showing external appearance.

Without going deeply into the theory of telephone transmitters, it can be stated that the volume of transmission depends upon the change of distance between the electrodes, brought about by the vibration of the diaphragm. The company claims that in all of the forms of transmitters now in use only one of the electrodes is vibrated with the diaphragm, and in the better forms this one electrode takes up the same amplitude of vibration as the central point of the diaphragm, which, of course, is the point of maximum movement. In the new transmitter shown in the accompanying illustrations both of the electrodes are attached to the central point of the diaphragm, and there is thus produced a variation in the distance between the electrodes of twice the amplitude of vibration of the central point of the main diaphragm.

It is claimed that a transmitter constructed along these lines will produce a greater volume of transmission than if only one of the electrodes is movable. This transmitter is given such an adjustment that under ordinary tones of voice the volume is even less loud than with some of the forms of sensitive transmitters now being manufactured, but as the voice is raised the volume of transmission from the instrument is multiplied twofold, so that the transmission when talking in a loud tone of voice has much more volume than that from any other type. The advantage of this is readily seen.

The mechanical construction of the transmitter follows out the practice that has been found to be the most satisfactory for high-class apparatus: that is, the use of highly-polished carbon electrodes and irregularly formed carbon granules enclosed in a practically moisture-proof case, using no absorbent material whatever, so that the transmitter when once assembled should be entirely free from any bad effects due to atmospheric changes, and should be equally as efficient in any climate. The transmitter is made more durable, particularly in damp climates, by the use of an auxiliary moisture-proof diaphragm over the main diaphragm, thus preventing any chemical action of the main diaphragm, due to moisture or alkali from the breath.

The illustrations, Figs. 4, 5 and 6, clearly show the construction of the instrument. It should be observed that what corresponds to the front electrode in the ordinary transmitter, is divided into two halves, each forming a terminal. The back disc with highly polished carbon is used only as an electrical connection between the two halves of the transmitter. Fig. 3 shows the diaphragm with the connectors and cup attached. Fig. 4 shows the front view of the cup with the diaphragm removed, and the method of fastening the connectors to the electrodes. Fig. 5 shows the cup dismounted with the granular carbon removed; "*a*" shows the front of the cup with the electrodes fastened to the auxiliary mica diaphragm; "*b*" shows the cup with the back carbon disc. Fig. 6 illustrates the parts of the cup; "*c*" is the back or neutral

The Spirit of The Wire

Electricity will be given the greatest demonstration of its multi-varied uses and powers ever known at the

ELECTRICAL SHOW

In the Coliseum, Chicago, January 15-27, 1906

Every large manufacturer will be represented and the displays will furnish a most comprehensive index to the development of electrical machinery.

No one interested in the application of electricity should miss this Exposition. To telephone men especially it offers unequalled opportunities for examination of the greatest amount of up-to-date apparatus ever brought together at one time. Either directly or indirectly there is hardly a manufacturer who will not show some apparatus which has a use in the construction or operation of a telephone system.

THREE DAYS

Jan. 22, 23, 24

HAVE BEEN SET ASIDE AS

Telephone Days

and on these dates events of special interest to the telephone world will be held.

You had better not put off making arrangements for your trip to Chicago, because if you do not see the Electrical Show you will have missed one of the greatest educational lessons ever devised. Come prepared to stay as long as the show lasts, because every minute you spend at it will be worth dollars and cents in information gained to aid you in your business.

DON'T FORGET AND DON'T DELAY, BUT DO COME TO THE ELECTRICAL SHOW, COLISEUM, CHICAGO, JANUARY 15-27

Digitized by Google

carbon disc; "*d*," the cup; "*e*," the separating ring; "*f*," the electrodes and mica diaphragm; "*g*," the clamping ring.

The various parts of the transmitter are made in accordance with the highest standard established by careful experiment and observation under practical conditions.

The carbon electrodes used in this transmitter are manufactured by the company itself of a special grade of very dense carbon properly treated, so that it is of exceedingly low resistance, and securely soldered to the connecting discs without the use of any salts or acid. The surfaces of the carbon buttons are very highly polished, which lessens the danger of the transmitter packing, and prevents arcing. The granular carbon is also manufactured in the company's own shop, and great care is exercised in selecting the raw material and in preparing the product, so as to produce the proper resistance to give the best results. The carbon is so thoroughly cleansed that it is all of such density that it will be entirely free from dust, which has a tendency to film the electrodes and seriously impair the transmission.

The diaphragm is made of extra hard aluminum, and is carefully straightened in a powerful machine of special design. It is protected by a celluloid disc. The auxiliary diaphragm for sealing the carbon cup is made of the best selected India mica carefully

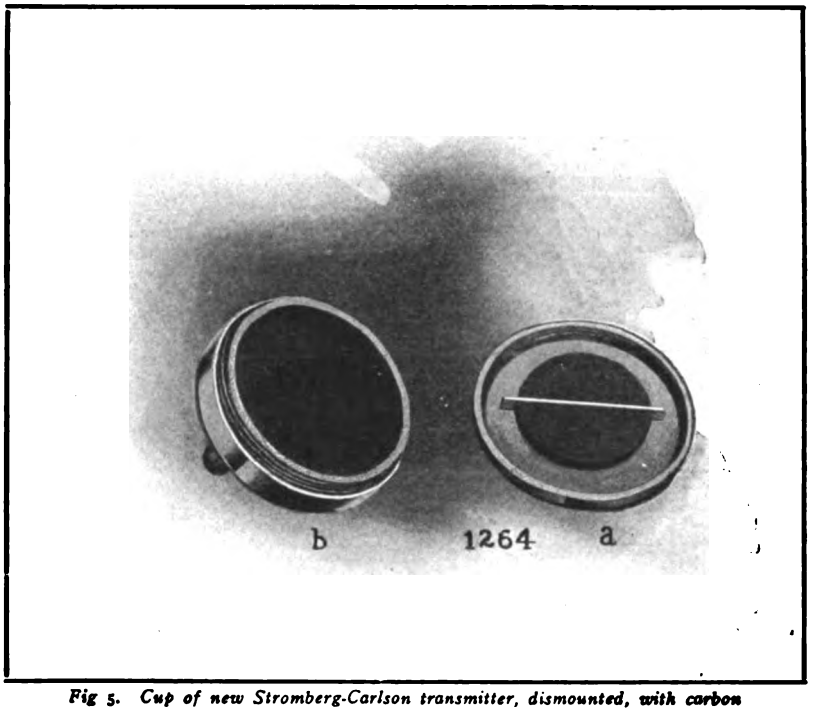

Fig 5. Cup of new Stromberg-Carlson transmitter, dismounted, with carbon removed.

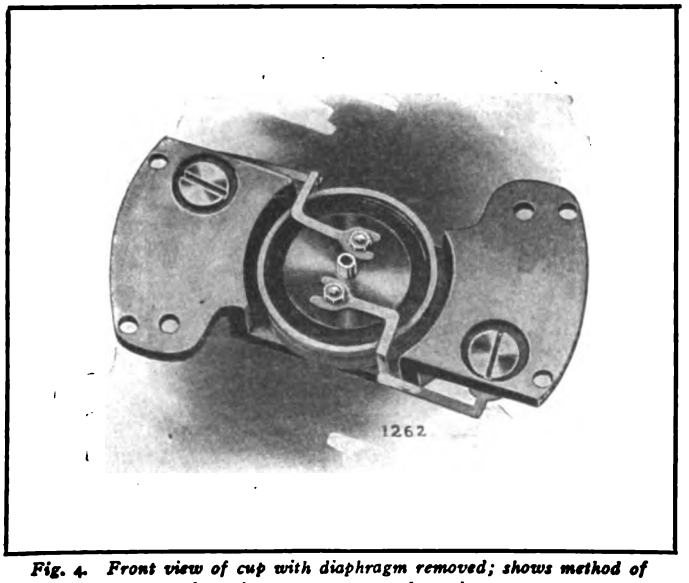

Fig. 4. Front view of cup with diaphragm removed; shows method of fastening connectors to electrodes.

gauged to thickness, so that all transmitters will be alike, and is securely held in place by the clamping ring.

The rubber band for insulating the diaphragm against vibration from the retaining case, is made of a very high grade of rubber, in order to insure its remaining soft and pliable and to prevent any tarnishing of the inside of the retaining case.

The bridge is made from heavy solid brass, the binding posts being insulated therefrom with mica, so that no part of the retaining case of the transmitter, or any exposed portion, is connected with the circuit. The front of the transmitter is made from heavy brass of simple design, and accurately turned, and the back is made of heavy sheet brass.

Each transmitter bears a serial number followed either by the letter "C" or the letter "L." "C" is for central energy transmitter, and "L" for local battery transmitters. Every instrument is accurately measured for resistance and given a practical test on both short and long lines in comparison with other instruments, thus assuring that each transmitter has been properly assembled and received an accurate adjustment.

THE BAIRD MANUFACTURING COMPANY INVADES CANADA.

THE Union Telephone Company of Florenceville, New Brunswick, is installing the Baird secret service party line system which is rapidly earning a reputation throughout the United States as an "Anti-Rubbering" equipment that works. Correspondence received by the Baird people of Chicago indicates that Canadian companies are watching this installation with considerable interest, and the success which it is meeting elsewhere promises a large volume of business in Canada.

THE WEEK'S MESSAGES

FINANCIAL.

BENSON, ILL.—The Jasper County Mutual Telephone Company has increased its capital stock from $10,000 to $25,000.

HEBRON, ILL.—At a recent meeting of the directors of the Farmers' New Era Telephone Company a dividend of 9 per cent. was declared on all capital stock issued prior to November 1.

PETERSBURG, ILL.—The Petersburg Telephone Company has increased its capital stock from $20,000 to $100,000.

TERRE HAUTE, IND.—The Citizens' Telephone Company has increased its capital stock, and will spend $200,000 in improving its system.

CRESTON, IA.—The Creston Mutual Telephone Company has declared its sixth annual dividend of 6 per cent.

HUDSON, N. Y.—The Columbia Telephone Company, of Hudson, has declared its fifth quarterly dividend of 1¼ per cent.

LANCASTER, O.—The Lancaster Telephone Company has increased its capital stock from $100,000 to $150,000.

FRANCHISES.

KING CITY, CAL.—F. J. Griffin has been granted permission to erect a telephone line from King City to Loneck and Priest Valley.

GALESBURG, ILL.—The Galesburg Telephone Company has applied for a perpetual franchise. It has recently increased its capital stock from $150,000 to $250,000; and, if granted the franchise will make extensive improvements in its system.

DOYLESTOWN, PA.—A franchise has been granted to the Standard Telephone Company, of Newtown, Pa., to construct and operate a telephone system in Doylestown.

COVINGTON, KY.—The Citizens Telephone Company has been granted a franchise in Covington.

NORTHAMPTON, MASS. The Citizens' Independent Telephone Company, of Williamsburg, has been granted permission to operate a telephone system in Northampton.

RENO, NEV.—J. H. Anderson, of Tulare, and W. D. Arnett and Lee Davis, of Reno, have applied for a franchise to operate an Independent telephone system in Reno. If the franchise is granted they will commence work at once.

ANGELICA, N. Y.—The Inter Ocean Telephone & Telegraph Company has been granted a franchise to build a toll and local line in Angelica. The new line will connect with the long distance line at Friendship.

CANASTOTA, N. Y.—Cordella Herrick, of Auburn, and R. J. Fish, of Oneida, are endeavoring to obtain a telephone franchise in Canastota.

ARDOCH, N. D.—A franchise has been granted to the Northwestern Telephone Exchange Company to operate an exchange at this place.

EAST GRAND FORKS, N. D.—The TriState Telephone Company is to apply for a franchise at East Grand Forks. This company is also to apply for a franchise at Crookston.

COMBINATIONS.

HUDSON, IA.—The Home Mutual Telephone Company has purchased from the Corn Belt Telephone Company a line extending from Hudson through the townships of Orange and Blackhawk.

PARSONS, KAS.—The Citizens' Home Telephone Company has acquired possession of all properties, franchises, and all other rights and emoluments of the Home Telephone Company. This merger embraces the exchanges at Parsons, Pittsburgh, Oswego, Chetopa, Altamont, Mound Valley, Edna and Bartley.

MILAN, MO.—The Milan Telephone Company has recently been purchased by the Sullivan County Mutual Telephone Company.

CHADRON, NEB.—The Chadron Mutual Telephone Exchange has been sold to A. W. Reikman, president of the Citizens' State Bank of Chadron. W. D. Burkett will have charge of the exchange.

DURAND, WIS.—The Durand Light and Power Company has purchased the Pepin Telephone Company's line from Durand to Arkansaw.

ELECTIONS.

QUINCY, ILL.—The Quincy Long Distance Telephone Company has elected the following officers: R. F. Spencer, president; C. M. Polk, vice-president; J. H. Murphy, secretary and treasurer, all of St. Louis. The company is rapidly completing arrangements for operations.

CRAWFORDSVILLE, IND. The Alamo Cooperative Telephone Company has elected the following directors for the year 1906: James Harwood, Wallace McClure, William Swearingen, Edgar Etter, Aaron Walter, J. B. Griffin, David S. Myers, Charles Pickett and Jesse Clore.

CLAY, IA.—The Northern Rural Telephone Company has elected the following directors: Harry Heikens, of Summit; Fred Jaynes, of Freeman, and J. C. Johnson, of Clay.

JOPLIN, MO.—Directors of the Joplin Home Telephone Company have elected officers as follows: Thomas Gary, Macon, Mo., president; John W. Lane, Joplin, vice-president; H. E. Scovern, secretary; Breckenridge Jones, chairman of the board of directors. The board of directors embraces in addition to the officers B. Jones, W. H. Warren and John W. Lane.

CROSBY CREEK, N. Y.—At a meeting of the Crosby Creek Telephone Company the following officers were elected: W. I. Price, president; Joseph Knapp, vice-president; F. M. Olin, secretary; Fred Olin, treasurer.

NEW COMPANIES.

BLACK SPRINGS, ARK.—The Black Springs Telephone Company, of Black Springs, has filed articles of incorporation.

ELGIN, ILL. A telephone company which will be known as the Turkey River Farmer's Telephone Company has been organized at Elgin.

GOLCONDA, ILL.—An Independent telephone company has been organized with the following officers: F. H. Rector, president; Jas. R. King, secretary and treasurer, and F. H. Rector, W. C. Cummins and Oren Threlkeld directors.

DILSBORO, IND.—The Dilsboro Telephone Company, of Dilsboro, Ind., has been incorporated with a capital stock of $1,000. Incorporators are: C. Wilson, H. P. Long, and others.

ALTON, KAS.—The Alton Mutual Telephone Company has been incorporated with a capital stock of $1,000.

DOUGLAS, KAS.—The Douglas Home Telephone Company has been incorporated with a capital stock of $5,000.

MAYFIELD, KY.—The Independent Telephone Company, which owns the Paducah Company, has filed articles of incorporation at Mayfield, Ky. The Mayfield company is to be known as the Mayfield Home Telephone Company. The amount of the capital stock is $50,000. The incorporators are J. C. Morteith, Bloomington, Ind.; J. H. Burgin, of Nantoit, Pa.; W. B. Stanfield, C. C. Wyatt and Leon Evans, of Mayfield, Ky.

HAMMOND, MINN. The Hammond Telephone Company has recently been incorporated. The company has an established exchange.

PROSSER, NEB.—An Independent telephone company known as the Farmers' Mutual Telephone Company has been organized. The following board of directors was chosen: David A. Hare, Robert Lomax, R. L. Wilson, Henry Uden and O. F. Creason.

JERSEY CITY, N. J.—Reliance Telephone and Telegraph Company. Capital stock, $125,000, all common. Registered office, 15 Exchange Place, Jersey City, N. J. Incorporators: Arthur Johns, Lanier McKee and Kenneth K. McLaren. The incorporaters are dummy directors. Field of operation unknown.

JERSEY CITY, N. J.—Eastern States Telephone and Telegraph Company. Capital stock, $10,000,000, all common. Registered office, 15 Exchange Place, Jersey City, N. J., field of operation not known. Incorporators: Henry A. Bingham, Cornelius A. Cole and Alexander F. Garbe.

NEWS—WANTED

THE matter contained upon the Message and Operating Field pages of this paper is contributed largely by our special correspondents. We believe, however, that there are many valuable items of telephonic interest which are never brought to the attention of the public. There is no reason why this condition should exist, and the Editor, therefore, invites all telephone companies, and the officials of such companies, to furnish any information that they can consistently make public relative to financial statistics, new construction, elections, franchises and personal items.

THE WEEK'S MESSAGES

GLOVERSVILLE, N. Y.—The Independent Telephone Company, of Fulton County, Gloversville, N. Y., has been incorporated with a capital stock of $5,000. Incorporators: Frederick M. Young, Gloversville, N. Y.; William T. Briggs and A. Judson Baker, both of Johnstown, N. Y., and others.

HANNIBAL, N. Y.—The Hannibal & Martville Telephone Company, of Hannibal, N. Y., has been incorporated with a capital stock of $1,000. Incorporators: Bert Howland, Martville, N. Y.; Geo. Crofoot, Julius P. Rhodes, Hannibal, N. Y.

EDINBURG, PA.—The Rural Telephone Company, of Edinburg, has been incorporated with a capital stock of $5,000.

MILLER, S. D.—The Hand County Telephone Company has been incorporated with a capital stock of $10,000.

MONTGOMERY, TEXAS.—The Montgomery Telephone Company, of Montgomery, has been incorporated with a capital stock of $1,000. Incorporators: F. W. Peynghaus, M. S. Peynghaus and Robert J. Sullivan.

PERSONAL.

W. H. HAYES has been promoted to be district manager of the Canadian Bell Telephone Company for Manitoba, including the city of Winnipeg.

J. P. MASON, formerly manager of the exchange of the Iowa Bell Telephone Company at Fort Madison, has been promoted to a similar position at Keokuk, Ia.

E. O. RUPPERT has taken charge of the system of the Valley Telephone Company at Lebewaing, Mich.

B. H. SKINNER, who has occupied the position of assistant chief installer for the Western Electric Company, Chicago, is about to sail for Manila, P. I., where he will install a large common battery exchange for the Philippine Islands Telephone and Telegraph Company.

MISCELLANEOUS.

MERIDIAN, IDAHO.—The Independent Telephone Company has extended its line from Meridian to Kuna, and has established a toll station at that point.

DIXFIELD, ME.—The Northeastern Telephone Company has completed a new line from Wilton and Farmington, connecting with Portland.

TOLEDO, O.—The Toledo Home Telephone Company is very busy at putting in new private exchanges throughout the city. Among those, which are to be completed about the first of the year, is an exchange for the Wayne Hotel, a board connecting about 140 rooms. A private exchange is being put in at The Tavern, which will connect up about 70 rooms. A private exchange is being put in for R. A. Bartley, the wholesale grocer. The Y. M. C. A. building is being furnished with two trunk lines and 15 sub-stations. A new exchange was installed last week for the Toledo Press, three trunk lines and a dozen sub-stations being provided. Work will begin after Jan. 1st to install a private exchange, which will connect the 36 school buildings of the city. The central high school building will be provided with 6 sub-stations.

COLUMBIA, WASH.—The Citizens' Telephone Company, of Columbia, has been organized for the purpose of supplying the town of Columbia, and the suburban districts as far as Renton, with telephone service.

New Construction in the Field

MOBILE, ALA.—The Home Telephone Company has begun the work of putting 300,000 feet of cable under ground. It is estimated that fully $350,000 will be expended by the company on its local plant, as well as its long distance connections between Mobile and Baldwin counties. In addition, the company is building a modern exchange on Conception street. Switchboards are to be put in, making provision for additional subscribers.

PARIS, ILL.—The Wabash Valley Telephone Company is to thoroughly inspect its system, and make extensive improvements at its several exchanges. In a short time the Bell telephones of the local system will be replaced with the Kinloch central energy telephones. The contract with the Bell Company, which expires in about a year, will not be renewed.

BADGER, IA.—The Badger Telephone Company is to construct a number of rural lines.

BURLINGTON, IA.—The Jefferson County Telephone Company has recently completed a toll line to Burlington. It is expected that connection will be made to Monmouth, Galesburg, and about 150 other towns in western Illinois.

MADRID, IA.—The Madrid Ice and Telephone Company will put in a new switchboard at its exchange.

HEATH, MASS.—The Heath Telephone Company is extending its lines from Hawley to Watson and Spruce Corner.

BELLAIRE, MICH.—The Traverse Bay Telephone Company is to put in a new switchboard. The company's lines will connect at Acme with the Citizens' line.

VERMONTVILLE, MICH.—The Citizens' Telephone Company is extending its lines and installing new telephones. It is its intention to transfer the Kalmo exchange to the local exchange.

AKELEY, MINN.—The Red River Lumber Company will extend its telephone line to connect with the Solway line at Squaw Lake.

ATTICA, N. Y.—The Attica Home Telephone Company has commenced the installation of its system under the franchise recently granted.

BAITING HOLLOW, N. Y.—The lines of the North Shore Telephone Company, and the Baiting Hollow & Roanoke Telephone Company have been connected at Wading River, and local service is thus extended to Fort Jefferson and Patchogue.

CHENANGO FORKS, N. Y.—The Chenango Valley Telephone Company is constructing a line from Chenango Forks to Triangle.

FALCONER, N. Y.—The Home Telephone Company, of Jamestown, is about to install a telephone exchange at Falconer.

GREENWICH, N. Y.—The Commercial Union Telephone Company, of Schuylerville, is to install a telephone system in Greenwich.

PITTSTOWN, N. Y.—The Pittstown Telephone Company is to build a trunk line to connect with the Johnsonville Telephone Company.

SENECA FALLS, N. Y.—The Home Telephone Company proposes to extend its line to Interlaken.

SOUTH APALACHIN, N. Y.—The Cindirilla Telephone Line is now complete from Friendsville to South Apalachin. The company expects to extend its line to Apalachin and Binghamton.

ASHEVILLE, N. C.—The Asheville Telephone Company is to soon commence the construction of its underground system in Asheville.

AKRON, O.—The Peoples' Telephone Company will spend $75,000 in erecting a new building and installing a new plant at Akron, O.

COLUMBIANA, O.—The Columbiana County Telephone Company is extending its lines to take in Ross Meadows, Cannon's Mills and vicinity.

EUGENE, ORE.—The Edenvale Telephone Company is constructing an Independent telephone line from near Pleasant Hill to Springfield. R. J. Hemphill is president of the company.

BIRDSBORO, PA.—John Rothermel, Irvin High, George Reichey and Joel Reiter are prime movers in the construction of a telephone line from Birdsboro to Stonetown and Reading.

DOYLESTOWN, PA.—The Keystone Telephone and Telegraph Company has begun work installing the system in Doylestown, and will have a line working to Philadelphia by spring.

NEW LEXINGTON, PA.—Mr. C. B. Moore, of New Lexington, is having a line built from New Centreville to New Lexington, where it will connect with the Somerset Telephone Company's lines.

TERRELL, TEXAS.—The Flashlight Telephone Company's system has been installed in Terrell, and the old telephones are being replaced with new ones.

INWOOD, W. VA.—The Inwood Rural Telephone Company has been granted a franchise, and will construct and operate a line in the southern part of the county.

WHEELING, W. VA.—The National Telephone Company, Wheeling, is to install two new telephone exchanges in the Wheeling district. Plans are also under way for the erection of a new exchange building at Warwood, where Woodland, Loveland and Glenova will be connected.

The company is also extending its lines from Pleasant Valley to West Alexander, Pa. At the latter place they will connect with the system of the Claysville Telephone Company, which has a large number of subscribers in Washington County.

SONORA, MEXICO.—The congress of Sonora has approved the contract executed between the executive and Llanos de Oro Company, S. A., for the construction of a telephone line from Sonora to the El Bolulo mining camp.

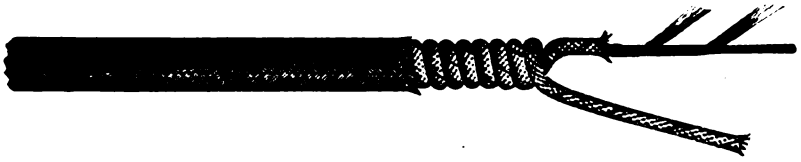
THE CORD THAT LASTS.



This cord consists of two steel piano wires covered with a spiral of fine copper wire. The cord is then insulated with a silk and cotton insulation and each conductor is covered with a cotton braid, one of the conductors having a red tracer so as to distinguish it from the other. The conductors are then formed into a spiral and covered with a heavy, waxed, gray Gilling Thread.

"EACO" STEEL SWITCHBOARD CORD

will outlast anything on the market. Write and get prices, and when doing so state what make of switchboard you are using.

TYPE A—10-Pair Hall Cable Box.

Do You Use Cable?

If you do, you know its advantages. If you don't you should get acquainted with it. But cable distribution requires the use of terminal boxes. In the selection of the right one you may err, therefore it is best to buy the one that has the greatest amount of merit. That one is the HALL. It was designed by a man who is an expert in cable construction. There being none on the market that suited his ideas, he set about inventing one, and he invented a good one. So good, in fact, that those companies which have tried it would as soon install bean sticks for their pole lines as to use any other cable terminal. That's a pretty strong comparison, but we know it is right, and so will you if you will only write us for a trial order.

ABOUT GERMAN SILVER

Contact springs are made from German silver; for it retains elasticity.

No metal used in telephony demands greater care in production; for the contact springs are in action more than any other part of the apparatus—they must retain their tension indefinitely under frequent strain. For permanent flexibility the composition and temper of the metal is as hard as it is possible to make it and preserve a safe factor between elastic and brittle qualities.

Commercially, there are many grades and degrees of temper in German silver, but that used by "NORTH" is made and tempered from a special formula obtained by years of practical experience. In 100 lbs. of German silver there are 60 lbs. of copper, 18 lbs. of nickle and 22 lbs. of zinc. The copper and nickle are melted together and the zinc separately; for the temperature required to melt nickle and copper would destroy the zinc. The whole is mixed in a molten state and cast into slabs one-half inch thick and reduced cold to the desired gauge by a succession of rolls. During the process it must be softened at each reduction of 10 gauge numbers by heating and plunging into water; for the metal is tempered naturally by roll pressure. (Contrary to steel, German silver, like copper and brass, is hardened by allowing to cool slowly, and softened by heating and cooling suddenly.)

The degree of temper desired is regulated accurately by the period of softening previous to its passing through the last roll for its final reduction. For instance No. 24 gauge is softened for the last time at No. 14 gauge. If a German silver of less temper is desired than that used for contact springs, it is softened at No. 18 gauge.

All "NORTH" contact springs retain their tension indefinitely; the metal is analyzed and tested to an exact point of flexibility before it is used—then again, "NORTH'S" contact springs are longer than usual and assume their normal position after frequent or unusual strain.

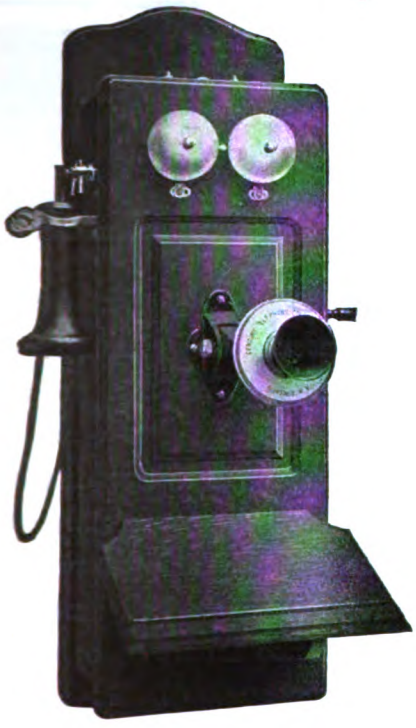
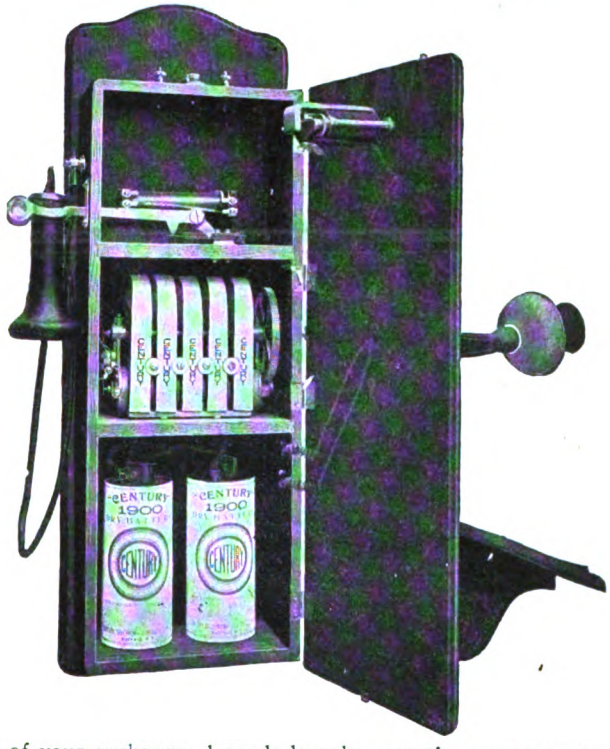
CENTURY

100 % GOOD

MAGNETO TELEPHONES





The quality of your service, also the earning power of your exchange, depends largely upon the apparatus you are using.

Therefore, is it not good policy to use nothing but the very best apparatus?

Our No. 65 magneto telephones will give your subscribers the very best service. Their use will also increase your dividends by reducing to the minimum your maintenance charges.

Our No. 65 magneto telephones have been carefully developed and perfected to such an extent that they can be relied upon for perfect service at all times.

These telephones are made up in all the different types, for all classes of service.

You may make a thorough test of these telephones; we will send you one or two series bridging instruments on 60 days' trial, charges prepaid.

Don't you think this offer is worth considering? Send us an order.

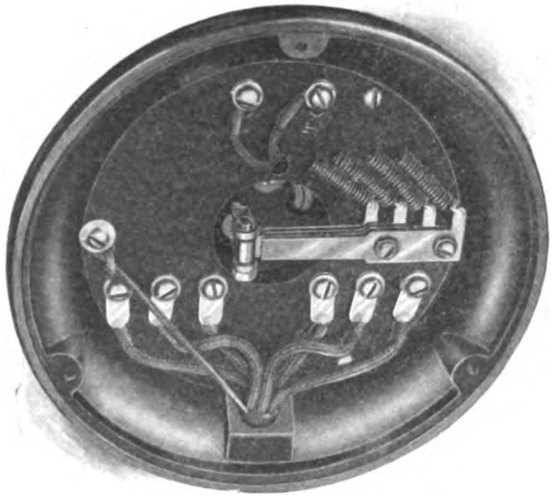
MONARCH APPARATUS

THE DESK SET



All wiring of a Monarch Desk Stand terminates in the base. The transmitter connections are metallic, and are brought down in two conductor silk cord. The hook switch springs being mounted upon the base, no other wiring passes through the pedestal tube. The connecting plate is made of hard rubber. All connections are plainly marked. Clips are provided for the receiver and connecting cords. All connecting plates are interchangeable. Local battery desk sets can be made to common battery by changing the connecting plates and transmitters. All Monarch Telephone Apparatus is described in the new catalogue. A copy will be sent upon request.

DEAN TELEPHONE APPARATUS

"There Must Be a Reason."

Efficiency

We have continually talked efficiency in advertising our apparatus—the efficiency that means a dollars and cents saving in operation and maintenance.

This efficiency has been the means of our continually increasing business—business from the most conservative and skeptical buyers.

Our magneto and local battery apparatus will help to pay your dividend and at the same time will give you pleasure in operating your exchange—the pleasure of not having excuses to make for poor service.

It will pay you to try the celebrated Dean product in your new year's construction.

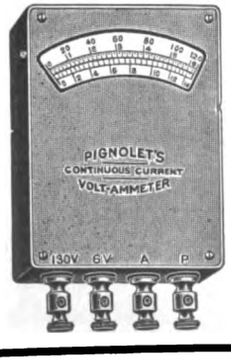
THE VALUE OF A MEASURING INSTRUMENT



Suppose you have a line in trouble—grounded or open. You don't know the exact location, but you send out a troubleman to hunt it up and clear it. It may take him an hour or a day. Meanwhile the subscriber is getting hot under the collar and saying things about telephones in general and yours in particular.

If you have a Pignolet voltmeter or volt-ammeter you can determine the approximate location and also get an idea of the nature of the trouble. With the information your troubleman can find the fault in jig time, and you will have prevented the subscriber kicking by giving him service at the earliest possible moment.

Does it pay to be informed? You ought to know.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit
78 CORTLANDT ST., N. Y.

To Confirm Our Claim "Rapid Operating"

The letter below proves the above claim which we made in the last issue of this paper.

EL PASO TELEPHONE CO.

EL PASO, Ill., September 20, 1905.

Stromberg-Carlson Telephone Mfg. Co., Rochester, N. Y.

GENTLEMEN:—Replying to your inquiry, regarding our Generator-Call Visual Signal Switchboard, will say that the same has been installed a little over two years and has given perfect satisfaction. The best explanation as to its rapidity will be shown in the fact that never more than two operators are at the board during the busiest hours. We have 325 Phones installed in the city and 38 country lines on which we have 350 subscribers, making a total of 675 people whose calls are attended to, with little effort during the busiest hours by two operators.

We think this is the best recommendation we could give your board. We have had very little trouble in keeping the board in perfect condition and we can gladly recommend it.

Truly yours,
A. E. FLEMING, Mgr.

Next week we expect to tell you what the user has to say about *Maintenance*.

If you are going to put in a Generator Call Equipment, you could not improve upon this type of equipment.

Let us quote you prices.

Have you received a copy of our booklet No. 91-B, describing our new transmitter?

NEARLY 90 PER CENT.

of all the telephone exchanges (both new and replacements) sold in the United States during the past two years have been

OUR AUTOMATIC SYSTEM—BECAUSE

It improves the service; being perfect, prompt and absolutely private, thus supplying a logical reason for advancing rates which have been too low.

It lowers the expenses; costs 50% less to operate and maintain than a manual exchange.

It makes it possible for the operating companies to pay good dividends on their stock, thus

It enhances and steadies the values of telephone securities, making and keeping them a safe, desirable and profitable investment.

Our automatic system adopted in the following cities:

CHICAGO, ILL.	SOUTH BEND, IND.	ALBUQUERQUE, N. M.	WESTERLY, R. I.
GRAND RAPIDS, MICH.	ABERDEEN, S. D.	TRAVERSE CITY, MICH.	MANCHESTER, IA.

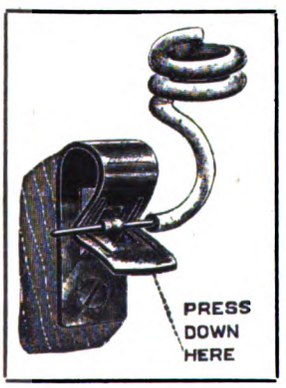
ISN'T IT

just as important to have high efficiency in the matter of the connectors that are used to take the current out of a dry battery as to have high efficiency in the current generating qualities of the cell itself?



If you believe this, and we see no grounds for an argument, then you should have

FAHNESTOCK SPRING BINDING POST

on your dry batteries.

Why run a chance of counteracting the electrical efficiency of your battery by a poor connector, especially when you can have the best by merely asking for it?

If you want to be shown just write us and remember that you can get Fahnestock spring binding post on any make of battery.

Fahnestock Electric Co.

132 Havemeyer Street, Brooklyn, N. Y.

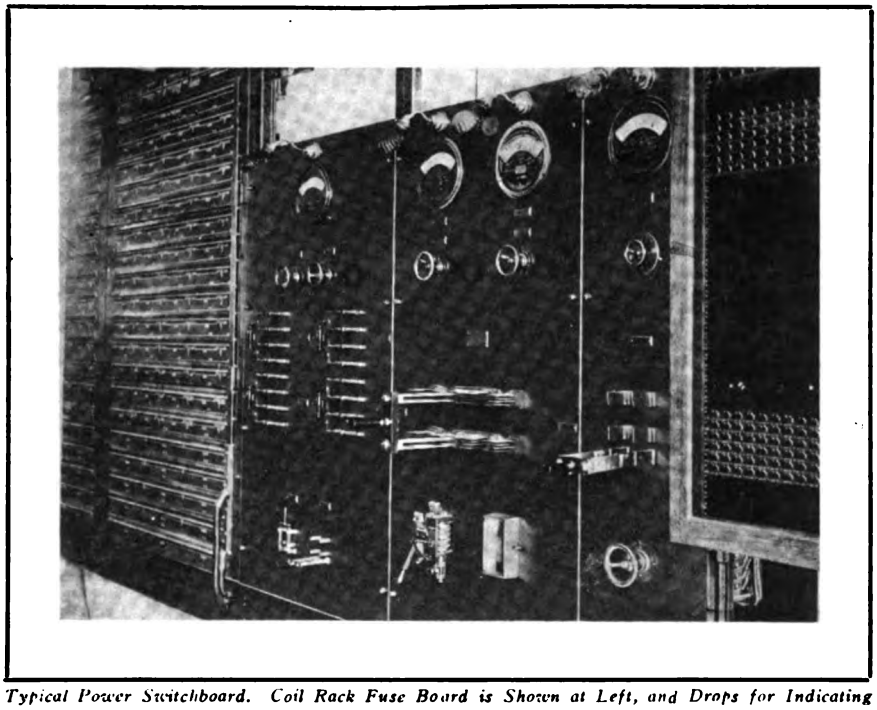
Power Installation*

By Arnold F. Pierce.

With plates in position and attached to bus-bars, it remains to fill the cells with acid solution. This is made of water and sulphuric acid, the latter being about eight or ten per cent, of the volume of water. Pure, distilled water is advisable for solution purposes, and the acid used should be of good quality. The solution may be obtained ready mixed from supply houses, and will be found to be of proper strength, reading about 1,200 degrees on the hydrometer. If desired, the solution may be made by adding the acid to distilled water until the proper specific gravity is reached. Care should be taken in mixing; the acid must be poured slowly into the water, and never the water into the acid, and the water should be agitated during the mixing process. As considerable heat is evolved, earthenware or lead vessels are preferable to glass for the purpose.

Rules and data upon charging the cells are furnished with the battery, and, of course, the amount of current used is dependent upon the size, or capacity of the installation. The machine voltage is always set higher than the battery potential, though the margin is only four or five volts with the usual 30-volt generator. The battery is charged continuously for from forty-eight to fifty-two hours, and then allowed to discharge for a given period through a given resistance, the data for the rate of charge, etc., being given by the supply companies to cover the requirements of the special case. After charging and discharging the specific gravity of the solution will be found to be lowered, and is brought up to the stated standard by adding fresh solution. The solution should cover the tops of the plates by half an inch or more.

For the systems in common use there are two standard battery voltages. While 24 volts has been almost universally adopted for local telephone circuits, a pressure of 48 volts is frequently used for the cord circuits of toll and long distance equipment, and an extra set of cells is used, to work in tandem, or series with the main office battery. These cells are smaller, and of less current capacity than the main set, and can be set along the wall on shelves in the battery room, or upon a special battery stand.



Typical Power Switchboard. Coil Rack Fuse Board is Shown at Left, and Drops for Indicating Rupture of a Fuse in Line Relay Leads at Right.

Whenever possible, a separate room should be assigned for battery purposes, as the fumes from the cells are acid in character and will corrode metal work with which they come in contact, besides being detrimental to the health of those working in their vicinity. If inconvenient to place them out of the power room, they should be boxed in with a casing permitting easy and ready access to each or all the cells. This encasement should be provided with a leaden vent pipe of sufficient diameter to allow the gases to escape to a flue or chimney. The vent pipe should have no square corners; the elbows should be well rounded, and, as stated, the pipe should be of lead to resist the corrosive action of the fumes. If possible to set aside a separate room for the batteries, it should be well provided with ventilation and of an even temperature. The battery fuse-panel should have all metal parts thoroughly painted with asphaltum, or other heavy paint, and all brass lugs on the battery should be so treated, to prevent access of the fumes to connections and mountings. If iron conduits are used for carrying the leads, they should be thoroughly painted, as well as the insulation of the leads themselves. Too great precaution in this matter cannot be taken.

It is customary to cover the tops of the individual cells with plates of heavy glass or rubber, to prevent foreign matter from falling into the cells. All woodwork of tanks and supports should be frequently examined for leaks, and should be kept dry and painted at reasonable intervals with asphaltum paint.

A device for use in connection with the batteries which is of great convenience to the wire chief is frequently installed on the power-board. It consists of a switching apparatus, which, by the turning of a handle provided with an indexed pointer revolving over a marked dial, will give a reading of the voltage of each individual cell of the battery, a reading of the voltage of the entire string and of the generator voltage. The volt meter used in connection with this switch has two scales, one reading one to forty, and the other one to three or four. This voltmeter and switch affords a quick and convenient method of locating any faulty cells.

Frequently only a single ammeter is provided, this being connected to the middle points of a double-pole double-throw knife

*Continued from the issue of January 6th.

Digitized by Google

switch which can be thrown in one direction or the other to obtain a reading on the charge, or discharge lead, or to give the current passing through the lead connected to either battery, when the double battery system is used.

A suggestion has been offered and is being put in operation by some exchanges, in regard to placing recording ammeters in the charge and discharge circuits. By means of this apparatus a record may be kept of power expended and consumed in the operation of the plant. With such a method of regulation it would seem possible to obtain excellent data, both as to expense and efficiency of the power apparatus, and, furthermore, to assist in using discretion in the matter of the amount of charging current for the batteries.

From the battery fuse panel shown in the circuit of a previous article, it will be noticed that the discharge lead goes directly to the fuse panel. Referring to Fig. 5 of this article, a view of the fuse panel is shown. It consists of a heavy panel of slate, within a frame of angle-iron and placed adjacent to the repeating coil racks. Upon its face are placed the fuse mountings, and on the rear the lugs for the leads to repeating coils and other switchboard circuits. In the figure the vertical bus-bar to the lift is connected by means of a lug to the negative battery lead at "L." The horizontal strips are provided with set screws, as are the lugs above them. Fuses of the proper capacity are placed between these points, and beneath the rows of fuses lie the small fuse alarm strips. Each horizontal row is provided with a signal lamp, which will be spoken of later. It will be noticed that a portion of the panel is equipped for 48-volt battery, which is furnished by a special bus-bar, on the rear, and a separate battery lead from the terminal of the string of small cells. These bus bars carry only the leads for supplying battery either to toll operators' cord circuits, or to toll switching operators' cord circuits, dependent upon the type of switchboard in use. Where the average length of subscribers' loops is short no 48-volt battery is provided in the exchange.

The fuse panel as portrayed is merely intended to give the reader an idea of its purpose, as the arrangement of distributing leads is optional with the interests served in the exchange.

The segmented bus-bar at the top is designed for the wire

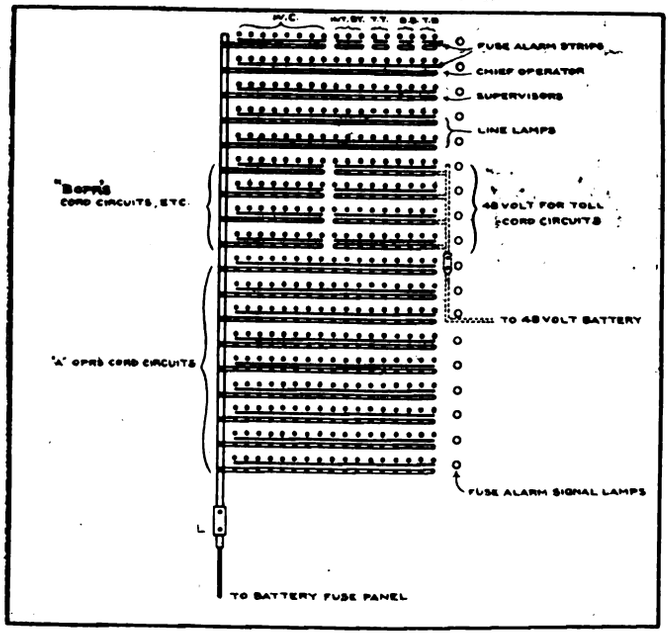


Fig. 5. Typical arrangement of bus bars and terminals for leads to switchboard and alarm signals.

chief's table, and the ringing and tone circuits. As the bus-bar for the latter is not always at battery potential, the upper bar is broken to accommodate this service.

The second strip feeds the chief operator's desk, its cord circuits, signals, etc. Further down is the strip for the supervisor's equipment, then the line lamps, etc. In this diagram are shown sections of the fuse board devoted to leads from 48-volt battery as well as for the "B" operator's positions, and lower the battery for the "A" operator's repeating coils. Below the transmitter feeds are shown, and the pilot lamps, and relay bays. No effort has been made to describe or illustrate a working panel, only to give an idea of the arrangement.

In the most recently installed offices of this type no separate

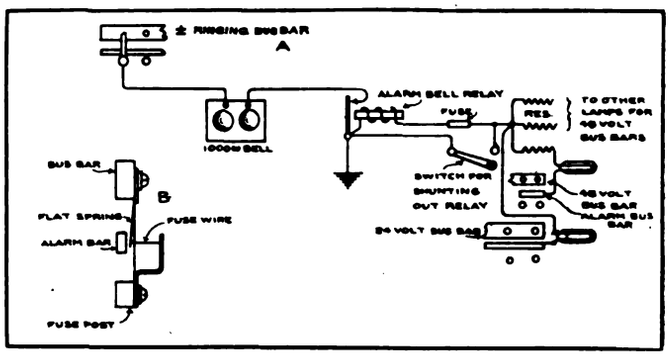

Fig. 6. Alarm circuit for indicating operation of fuse, and type of fuse used with this circuit.

bus bar is provided for line lamps, and other apparatus on the switchboard. The cable which carries the leads from the cord terminals to the repeating coils contains a number of wires, usually of No. 16 B & S gauge, which are extended beyond the repeating coil rack to the fuse board. Here they are connected to terminals in regular order with the leads which convey battery current to repeating coils. In this manner a single cable is made to carry nearly all the wires from the repeating coil rack and fuse board to an individual switchboard position.

When such a number of fuses are used, it is obvious that some quick method must be arranged in order to notify the attendant when and where a fuse opens. This has been provided for by setting a pilot lamp at the beginning of each fuse strip, and arranging that this will light up to designate the strip; and as the attendant may be in some other part of the building, an audible signal shall also be given.

In Fig. 5 is shown the small fuse alarm strip between the bus bar and the fuse mountings. A special form of fuse is used (see "B" in Fig. 6), which, when ruptured, or opened, drops the flat spring against the alarm strip, thus throwing battery from the bus bar to the alarm strip, thence (Fig. 6—A) through the alarm lamp signal, lighting it. From the lamp the current passes to ground through the low-wound relay "R." The operation of this relay puts ringing current through the bell to ground on the relay armature.

A fuse is provided in the battery relay circuit, and a jack-knife switch for shunting the relay when attention has been obtained.

When the alarm strip is segmented, as in some rows, the strips are strapped by jumpers on the back of the panel.

Various plans for indicating the location of an open fuse have been devised, of which the one described was for a long time the most satisfactory. An objection to its use which was raised, however, is due to the fact that although the bus bar on which the trouble occurs is indicated it requires a careful search to determine which fuse on the bar has blown. To meet this condition a fuse was devised in which the rupture of the fuse wire not only releases a spring beneath the bar for completing the alarm circuit, but also permits a spiral spring, mounted upon the face of the fuse, to operate and bring a white glass bead indicator, fixed to an extension of the spring wire, into a position where it is easily visible. In this manner the operation of any fuse automatically calls the attention of an attendant, even though he may be in a distant part of the room, to the fuse board. On reaching it he is able to determine at a glance which circuit is in trouble, and commence at once the investigation necessary for clearing the trouble.

Telephone Exchange Engineering

By Ray H. Manson, Chas. A. Simpson and Albion D. T. Libby.

Article XXIII. The Switchboard Layout.

It is always a great puzzle for the beginner in telephony to understand how it is possible for each operator at an exchange to be able to connect any subscriber with any other subscriber in the same exchange.

By referring to Figs. 102 and 103, it may be easily understood. One must remember that the part of the exchange at which the operators work is made up of several similar divisions, called sections. These sections, when fitted together, give an appearance of one continuous piece of framework. For convenience, a double line has been drawn to indicate the dividing line between the different sections. While the drawing does not show it, yet it must be remembered that section three is located immediately to the right of section two, section five at the right of section four, and section seven at the right of section six. The number of the section is shown immediately below in each case.

It will be noticed that the answering jacks and lamps are located in the lower portion of the face of the sections. The first strip of jacks is usually placed about three inches from the plug shelf which is represented by the lower line of the equipment drawing. The strips of answering and lamp jacks are located alternately, one above the other. Some manufacturing companies locate their lamp jacks immediately below the corresponding answering jack, but in the equipment, as shown, the lamp jacks are immediately above the corresponding answering jacks.

The lamp jacks in each panel are numbered from 0 to 49, individual jacks being numbered, however, instead of the end jacks of the strip, as shown in the drawing.

Each answering jack has a removable, interchangeable number plate. These number plates are stamped with numbers from 0 up to the number of lines there may be in the exchange which, in this case, is 1,799. These number plates designate the telephone numbers of the subscribers, and are made removable so that the traffic manager can arrange the lines so that the number of incoming calls will be evenly distributed amongst all the operators. In doing the latter it becomes necessary to disconnect a subscriber's line from an answering jack at one position and connect it to another located in front of a different operator. As it is always desirable that each subscriber shall keep the same number originally assigned him, the removable number plate is used, and transferred to the new jack at the time the line is changed. The actual operation of changing a certain subcriber's incom-

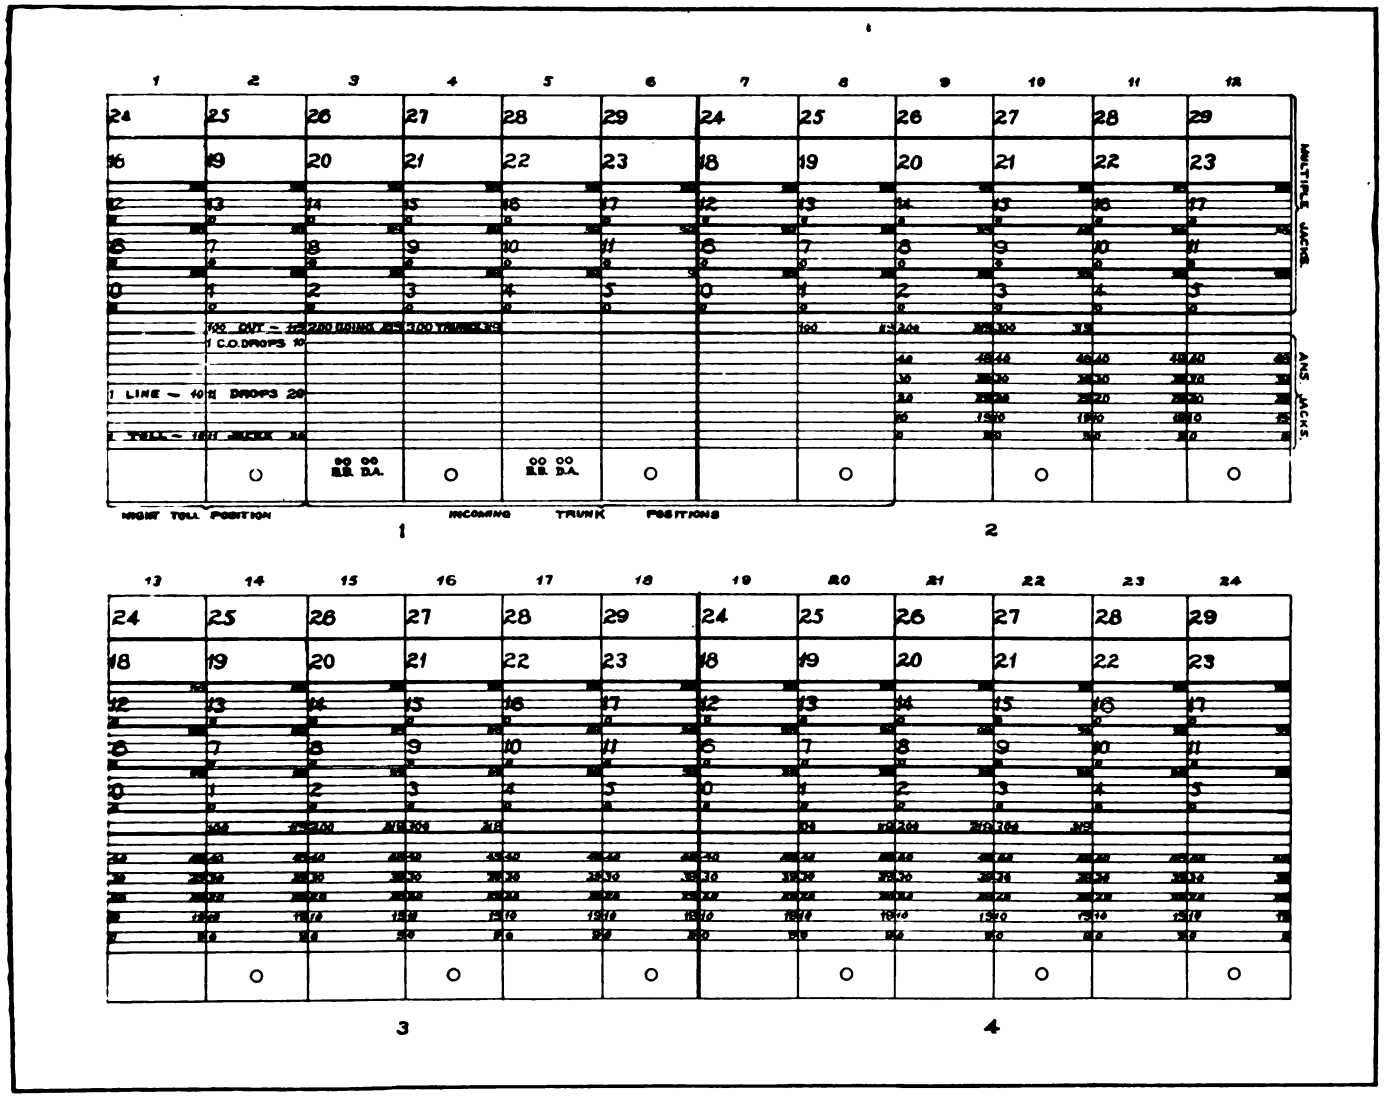

Fig. 102. Jack equipment, section 1, 2, 3 and 4 of the "Example exchange" common battery multiple switchboard.

Digitized by Google

ing calls from one operator's position to the other is accomplished by means of an "Intermediate Distributing Frame," and will be taken up fully under that heading.

It is always desirable to leave extra room for additional answering and lamp jacks at the top of the answering jack space of each panel of the multiple switchboard, as it may become necessary at some future time to add more lines to some operators in order that they may be kept as busy answering calls as the average operator. Owing to this fact, there are exchanges in operation with only forty subscriber's lines in some positions, while at adjacent positions there are one hundred and sixty.

The line pilot lamps are located in the space below the answering jacks. This space is covered with leather to prevent the plugs from marring the sections.

The outgoing trunk jacks are located immediately above the answering jack space. These jacks may be trunks to one exchange, or several, as the case may be. Immediately above each strip of jacks, a designation strip is located on the face of which is a piece of paper protected by a piece of transparent celluloid. On this paper are written the names of the exchanges at which the jacks immediately thereunder terminate. The outgoing trunk space is clearly separated from the other equipment by means of a thin white holly strip above and below.

Just above the outgoing trunk jacks are located the multiple jacks. These are grouped in banks of five strips of twenty jacks each, each group being separated from the one above by thin white holly strips, as shown in Fig. 107. Each group of jacks is numbered from 0 to 99, and each jack in each group has a permanent number stamped on the rubber mounting with the exception of the 5th, 10th and 15th jack of each strip. Instead of numbering these three jacks, there are two small white dots, one above the other at the side of the jacks. It will be seen that these white dots re-divide the bank of five strips into squares of five jacks each way. These dots enable the operators to more quickly pick out the number of the multiple jack corresponding to the subscriber who is to be called.

On the stile strips which divide the sections into panels are located ivory number plates with engraved figures filled with black enamel. These number plates designate the hundreds and are located at the left and in the center of each group of five jacks. These numbers are duplicated in each section.

The "busy back" and "don't answer" jacks for the two incoming trunk positions are located just below the answering jack space.

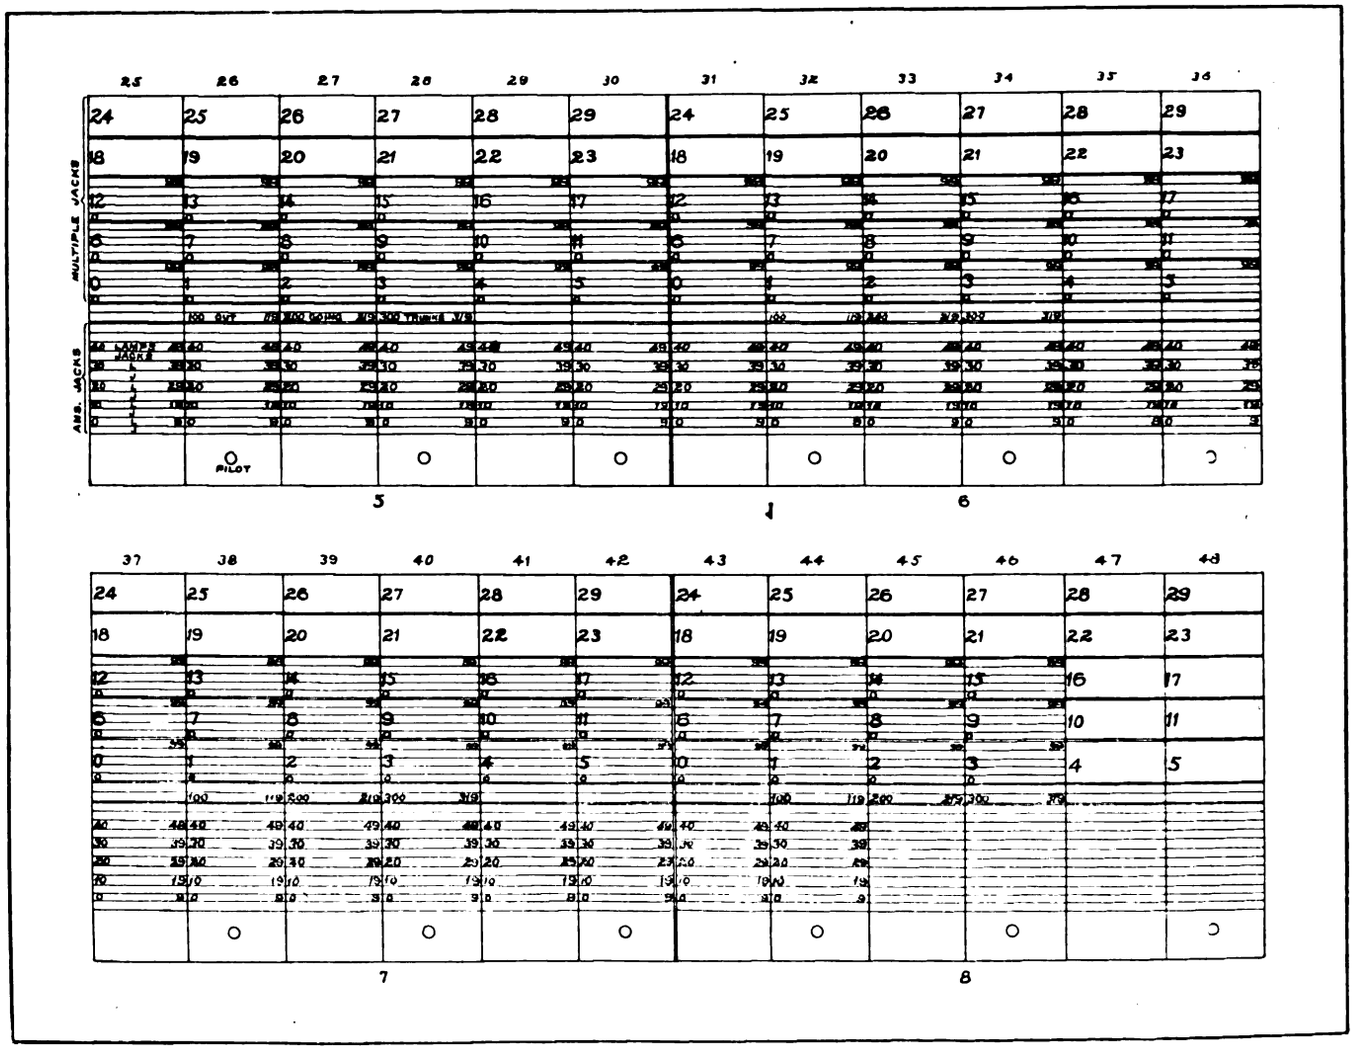

Fig. 103. Jack equipment, sections 5, 6, 7 and 8 of the "Example exchange" multiple switchboard.

The first position is equipped with twenty toll line drops and jacks for use at night only, or when it is not desirable or profitable to have an operator on duty at the toll board. The key shelf equipment of this position is shown in the lower left corner of Fig. 104, marked "B" section. The key equipment consists of three toll to toll cords with wiring for two more, and seven toll to local cords with wiring for three more. This position is also equipped with an operator's set. The listening key and ringing key for the front cord is located in front and the ring back key, or ringing key for the rear cord, in the rear. The relays and resistance coils for the toll to local circuits are shown located at the right of Fig. 105.

The second position is equipped with twenty incoming trunks, two "busy back" and two "don't answer" jacks, an operator's set and five order wire keys. These trunk circuits are equipped with machine ringing keys which are so designed that when the

Digitized by Google

ringing button is once depressed for calling a subscriber, it will remain depressed and keep ringing the subscriber intermittently until the receiver is removed from the switch-hook of the called station, when it will automatically restore and cut off the ringing current. This allows the operator to handle more calls than by the regular hand method of ringing.

The third position has an equipment which is a duplicate of the second position.

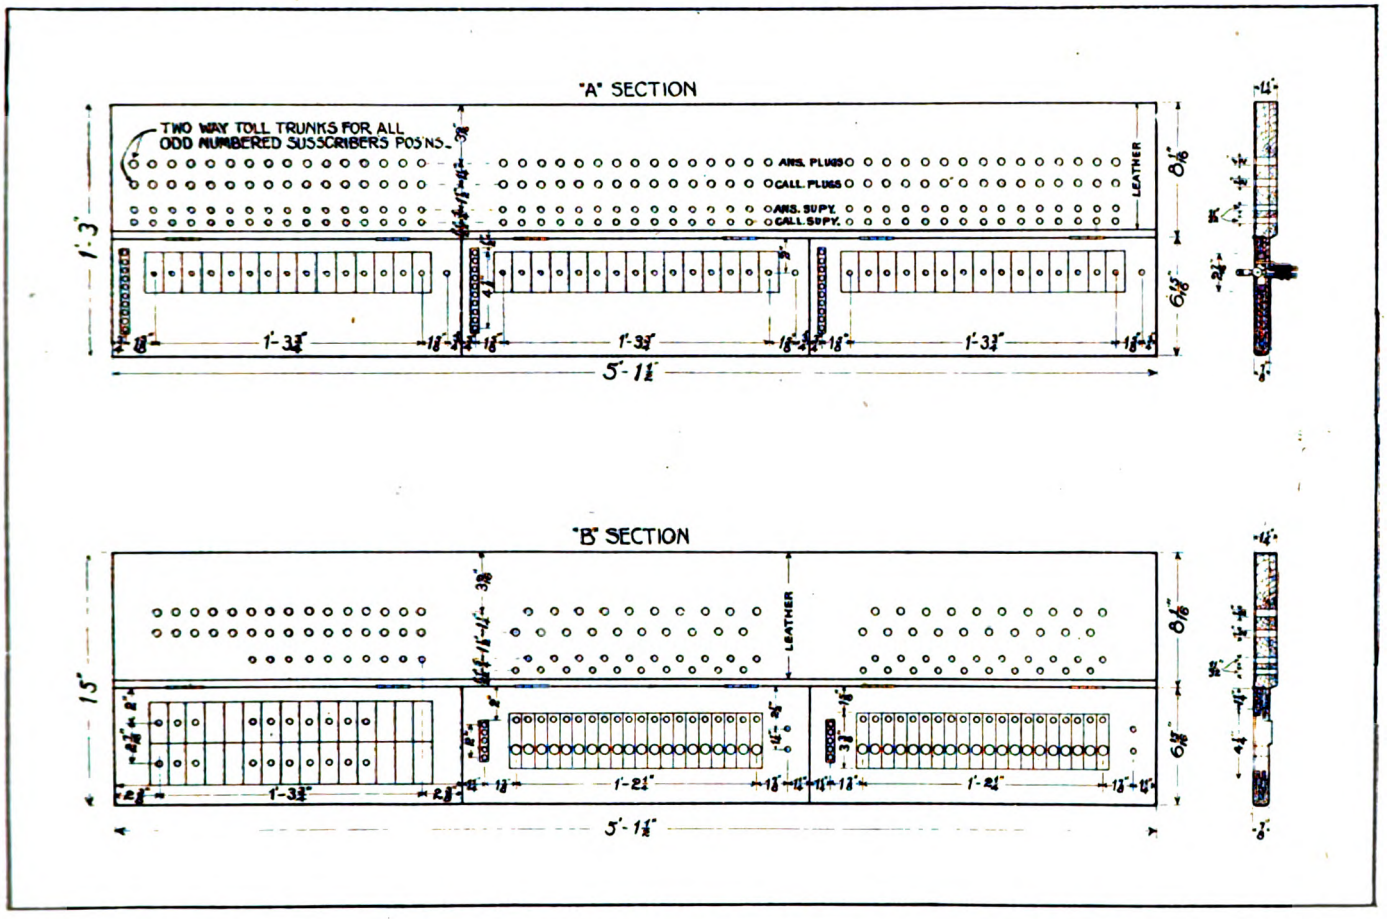

Fig. 104. Keyshelf equipment of the "Example exchange" common battery multiple switchboard.

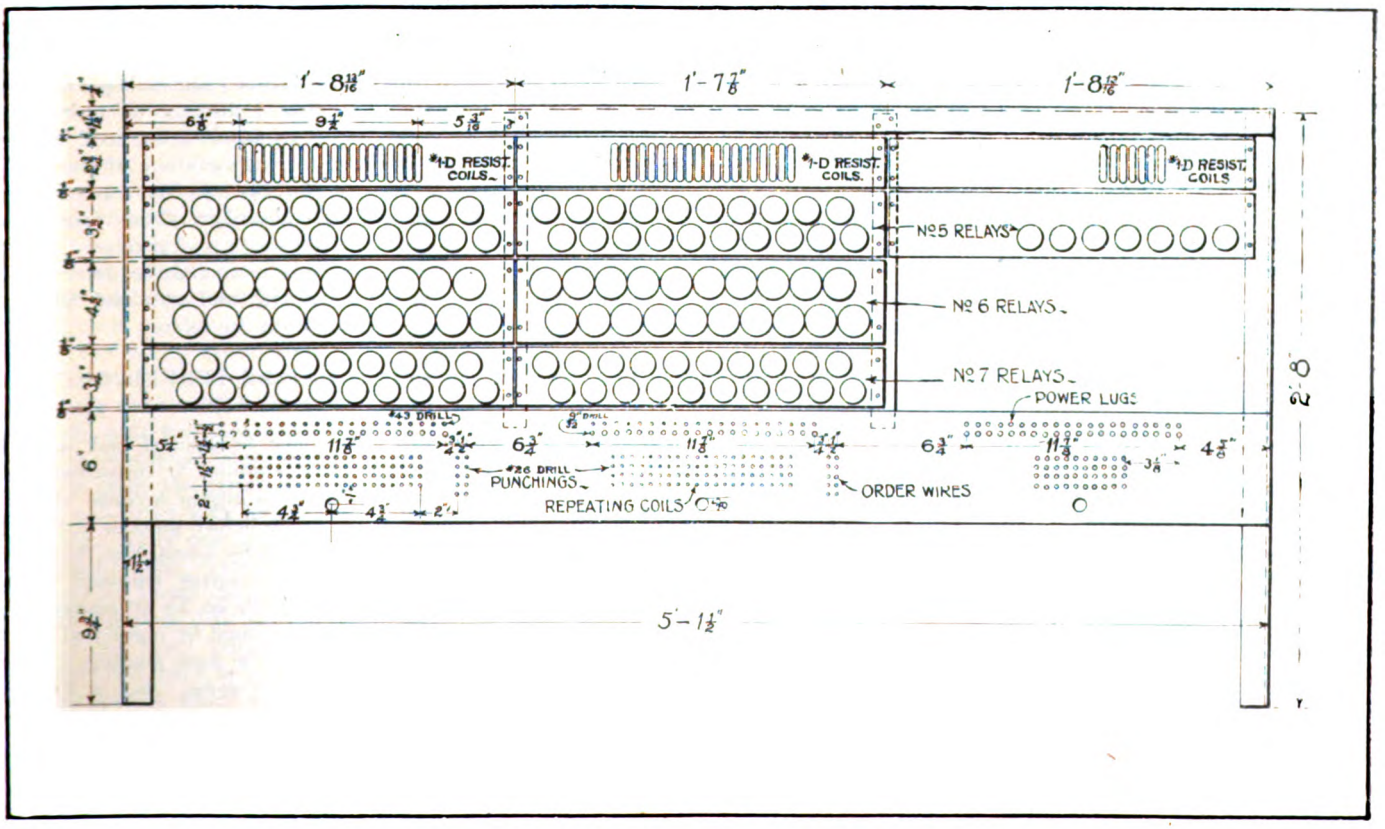

Fig. 105. Rear of first section; relay frame and connecting rack of the "Example exchange" switchboard.

Digitized by Google

The arrangement of the key and plug shelf equipment for the two trunk positions is shown in the right and middle position of the "B" section in Fig. 104. The arrangement of the relays and resistance coils is shown in the middle and at the left of Fig. 105. It will be noticed that there are a good many punchings located on the connecting rack just below the relays. To these are soldered all wires within the section for the cord and operator's circuits which have to be run to other parts of the relay of calling cord No. 1, relay of answering cord No. 2, relay of calling cord No. 2, etc.

Each odd numbered subscriber's position is also equipped with a pair of two-way toll trunks, terminating in plugs at the local board, as shown in Fig. 104 and in jacks at the toll board.

Each section is equipped with 1,800 multiple jacks for subscriber's lines and 60 multiple jacks for outgoing trunk lines. Since the multiple jacks in one section are each wired to their

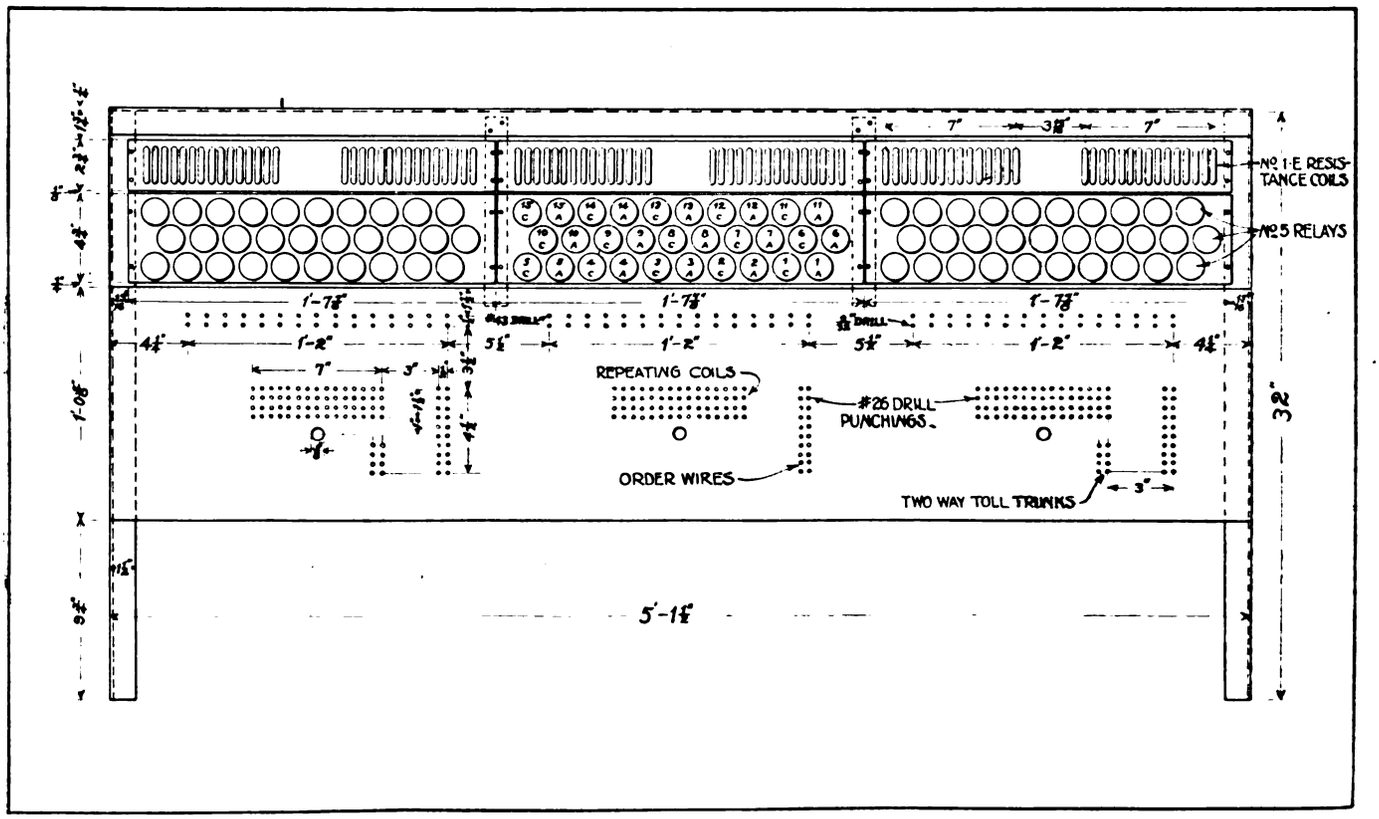

Fig 106. Rear of one subscriber's, or "A" section, "Example exchange" switchboard. Relay frame and connecting rack.

building after the sections are installed. This applies to all battery, repeating coil and order wire leads. These are arranged as indicated in a manner which makes all terminals of circuits extending beyond the switchboard sections readily accessible for the attachment of wires and their subsequent inspection when necessary for the clearing of trouble.

The fourth position is drilled and arranged for the same equipment as the second, but is left blank at present. A thin mahogany panel is provided to cover the key and plug shelf drilling.

Positions 5 to 22 inclusive are each equipped with 100 answering jacks and lamps, fifteen common battery cord circuits, an

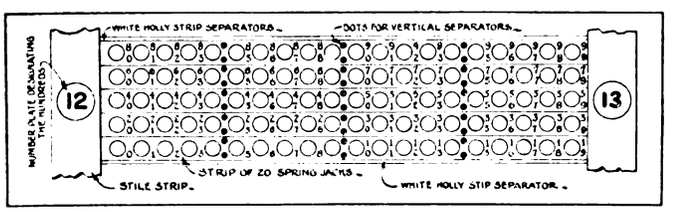

Fig. 107. Group of 100 multiple spring jacks, showing numbering.

operator's set and five order wire keys. The arrangement of the plugs, supervisory lamps and keys for these subscriber's positions is shown at the top of Fig. 104, "A" section, and the arrangement of the relays and resistance coils in Fig. 106. Fig. 106 also shows the arrangement of the wire connecting punchings of such cord and operator's circuits as extend to other parts of the building. The numbering of the supervisory relays 1A-1C, 2A-2C, etc., refers to the relay of answering cord No. 1, respective multiple jacks in other sections, each line reappearing once in every six panels, it will be observed that an operator at any one position will have to reach a distance of only two panels to the right or to the left (two panels being in front of each operator's position), in order to reach any one of the multiple jacks. This is why an operator can directly connect any calling subscriber to any called subscriber whose line may terminate in the multiple jacks of the same exchange.

The circuit to which these drawings refer and the description of same may be found in the April 11th and 25th and May 9, 1903 issues of THE AMERICAN TELEPHONE JOURNAL.

EFFECTIVE INJUNCTION MUST BE SERVED BEFORE ACT IS CONSUMMATED.

AN injunction, to be effective, must be granted and service obtained before the act to be enjoined is consummated. Many an injunction has failed to enjoin because of the swift work by the enjoined, so to speak, before process could be served, such as track laying by night. In St. Louis, Mo., recently one Dr. Mayfield wanted a telephone company enjoined from erecting a pole in front of his place. While he, his attorneys, the sheriff and a court clerk were rushing around by night trying to locate a judge the telephone workmen were busy digging a hole to plant the pole in. At this stage of the game, when it looked pretty certain the injunction would fail to arrive in time, the doctor's janitor was seized with an inspiration of genius. He trained the garden hose on the hole and the workmen and turned on the water. This damp substitute for an injunction was immediately effective, and it stopped further proceedings till the judge's temporary restraining writ had been duly served.

A New Two-Party Selective System

By M. C. Wilson.

NO doubt a number of magneto exchanges have come to the alternative of using two party lines or making immediate extensions to their system in order to accommodate new business that may be offered them. Usually the equipment, particularly as regards lines and telephones, is incapable of being worked on any of the existing selective systems, as all of them

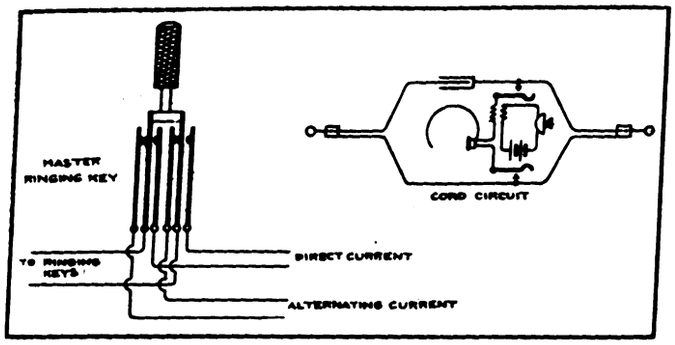

Fig. 1. Connections of condenser and ringing key in cord circuit.

that are practical require either metallic circuits, special telephones or both.

The Clay Center Telephone Company, of Clay Center, Kansas, is now successfully using a scheme by which two telephones are operated selectively on a common return system. The plan requires the two telephones to be connected in series, one an ordinary 80 ohm series instrument and the other a series instrument equipped with a direct current generator and a special bell. The bell is known as the Schwarze Universal Bell, and is intended to be rung by direct current, although alternating current will ring it unless hindered in some manner. The bells are wound to various resistances, 30 ohms. being the most common and most practical for lines up to about one-half mile in length. Over that length a higher winding up to 40 ohms is used. If the resistance of the winding is too high, the bell will be rung by the alternating current used to ring the polarized bell.

When operated in series with an ordinary 80 ohm bell, using current at about 65 volts, alternated moderately rapidly by a pole-changer, it will be found impossible to ring the direct current bell owing to the impedance of the ringers in series preventing a sufficient amount of current flowing to operate it. However, when a direct current of about the same voltage is applied to the line, the special bell will respond vigorously, while the ordinary polarized ringer will not be affected, except by, maybe, a single tap dependent upon the gong to which the tapper may be clinging.

The only additional central office apparatus necessary to operate the system on the ordinary magneto switchboard in a two-party selective key, wired as shown in the drawing, and a source of direct current, either battery or generator. It is not practicable to use the same battery as is used on the pole changer, as voltage will vary too widely if other operators are ringing.

There is no change necessary in order to use the standard cord circuit with the system but to avoid false signals from a ring-off a condenser may be inserted in the circuit as shown in the drawing. Only one is necessary, inserted in the line side, on a common return system.

The drawing shows the two bells as connected up in working order. No difference has been observed in placing either bell on the end of the line. During a conversation either party must talk through the other bell but that seldom causes any trouble. The longest line on which we have tried the scheme has a working resistance, including instruments of about 400 ohms, of which about 160 ohms is in the two telephones and heat coils, leaving about 240 ohms as the line resistance. This is much higher than the average. The bells can be rung on lines of any length, provided the voltage of the ringing current is high enough to give a current of from .18 to .22 ampere for the higher wound bells. From .3 to .4 ampere is required for the lower wound bells.

The most troublesome feature of the system is that line resistance is not always uniform within widely varying limits and ringing batteries are apt to vary in voltage. These two features must be carefully looked after when using the scheme or much trouble will be experienced with the special bell. It is likely, too, that the telephone will be used by a party who is most impatient at any real or fancied trouble; e. g., a new subscriber. Another feature that may, at times, cause some slight confusion is the fact that a ring-off from a third party may ring the polarized bell. This might be prevented, to a considerable extent, by inserting condensers in the cord circuits. Taking it all in all, it will be found to operate very well where it is necessary to install a two party system of some sort in order to handle some classes of business, or to tide over an emergency.

The system was originated, so far as is known, in the exchange at Clay Center, and is believed to be the only one of the kind in use at the present time. The exchange has some 600 subscribers connected to it and about 150 of them are on these special two party lines. The system will, no doubt, be of benefit to many exchanges that may be in need of something in the way of equipment for a small number of two party lines.

WHY INDEPENDENT COMPANIES CAME BACK.

SIX months ago three local Independent telephone companies in Montgomery County, Indiana, broke with the Home Telephone Company of Crawfordsville and entered into an exchange of service agreement with the Bell Telephone Company. During the past week the three companies returned to the Home Company and are glad of the privilege. They state that the service given them by the Bell Company was abominable and the business relations unsatisfactory and far from agreeable. "Never again will we flirt with the Bell Company," said the secretary of one of the three companies.

KINLOCH COMPANY REBUILDING ITS SYSTEM AT NORMAL, MO.

THE Kinloch Telephone Company is completely rebuilding its system at Normal. It has leased the second story of the First National Bank building into which it will move its exchange, which will be materially enlarged. A new switchboard with a capacity of 700 telephones has been ordered and is

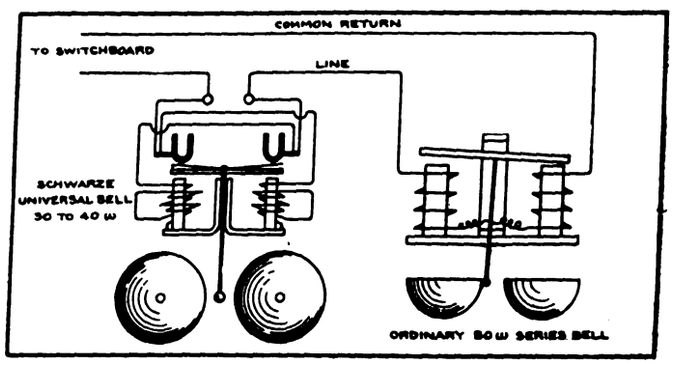

Fig. 2. Line connections for bells at subscribers' stations, on two party selective system.

expected to be installed in the new exchange early this month. This board will be of the central energy type.

The system will be similar to the one installed in Bloomington a few years ago. About 300 new poles are being erected to carry new aerial cable leads. A new 50 pair cable will connect the Normal and Bloomington exchanges to be used as trunk lines. This will double the present connections between the two offices and will greatly relieve the traffic. A large amount of underground cable will also be installed so as to remove the aerial lines as much as possible from the business and residence streets.

THE EDITOR'S PAGE

THE ULTIMATE PROTECTION.

THERE are many things which indicate that telephone companies are in recent times devoting much more attention than formerly to the subject of protection from fires. Buildings which contain telephone equipment are being constructed in accordance with the high standards of the insurance companies. Wide and long continued experience has shown the nature of the accidents which expose exchanges to risks due to the passage of unexpectedly strong currents over various portions of the wire plant. Modern methods of line and switchboard construction take into consideration these dangers, and provide for the reduction of the possibility of their occurrence to a minimum. Protective devices are arranged for the shunting of strong currents accidentally communicated to the wires into paths which prevent their passage through the most delicate parts of the equipment, or those most vital to the operation of the exchange. Provisions are even made in many switchboards for the restriction of fires to the portion of the plant in which they originate, in order that flames may not spread widely before they can be checked.

Unfortunately there are many exchanges in operation to-day which were installed before all these protective plans were developed. The inconvenience and high cost of their execution have prevented their universal application to old equipments, and even where they have been introduced, imperfections in their application, or the omission of one or more of the known precautions have left open loopholes for the occurrence of disastrous fires. That such omissions do introduce a risk is shown by the frequently occurring instances of at least partial destruction of central office equipment.

A fire in a telephone exchange may in all probability be said to require more intelligent action on the part of the force employed in the building where it takes place than in most establishments where business of another nature is carried on. It is extremely likely to start in such a manner that it may readily be extinguished, and its cause removed by proper remedies quickly applied. The special nature of the usual causes and the special dangers outside of the fire itself to which the equipment is exposed are the conditions which call for unusually well considered action. The control of a fire due to a current of high voltage introduced from the outside plant is liable to subject an uninformed employee to personal danger. It is also important that the nature of the switchboard equipment prevents the use of water in all but the most urgent cases, and calls for the careful application of other means for the extinguishment of flames. If the appliances at hand are not used with coolness and skill there is a possibility of extending the damage far beyond the limits to which it might easily be restricted. The necessity for avoiding any interruption of the service is such that operators must remain at the switchboard, and continue to handle calls up to the point where they begin to be subjected to risk of injury.

These conditions are well known, and their imperative nature well understood by all persons experienced in the operation of exchanges. In spite of this fact, however, many reports of small fires convey details which indicate that the conditions have not been met in the proper manner by the larger number of those present at the time of the accident. There have been numerous cases of delay in calling the persons competent to handle the difficulty. Appliances for the extinguishing of fires have been absent from their proper places, or if at hand, and located where they should be, they have been in poor condition. Operators have yielded to a natural timidity, and unchecked by strong control, or previous thought on the proper course of action, have abandoned their work without proper cause, and hurried from the room in disorderly fashion, bringing upon themselves the danger which always accompanies a panic of even slight extent.

Such occurrences have led to the adoption in many exchanges of careful systems of inspection of apparatus, and instruction of the force as a whole in the proper course to pursue in a time of emergency. At such a time the advantages of a regular training are felt by all present. In a time of danger the person who can conceive an absolutely new thought, a plan of action which is the one correct course from the many which are open, and have it complete and ready for execution all on the spur of the moment, has indeed a wonderful mind. To the honor of our telephone men, and our telephone operators, there have been told stories of just such action, when individuals have been inspired to the performance of deeds most highly creditable. Nevertheless it will be easily conceded that in the final resort, when careful design and good workmanship have failed, the best safeguard is a force trained to consider the proper line of movement to produce a result with which the imagination is familiar. Each individual instead of yielding to blind impulse, or vainly groping for an idea, recalls vividly a familiar train of thought. Action, rapid and precise, follows, and the difficulty is speedily overcome.

CONSTRUCTIVE TRANSMISSION.

FROM the point of view of the theorist, the problem of the reproduction of speech by means of the building up of complex electrical waves from a number of simple waves presents many attractive features. Such a process would bear a close general analogy to the actual vocal process which results in the production of speech. All students of acoustics are familiar with the fact that the articulation of each of the different vowel sounds, a, e, i, etc., is dependent originally upon the production of a tone of characteristic pitch due to the vibration of the vocal chords. These chords, lying in the throat, form a diaphragm with a slit along its middle. The edges are thin, and are susceptible to mental control like any other muscles. They are made to vibrate at the same time that a current of air is forced between them, and the rate at which they vibrate causes the production of a sound of corresponding pitch in the same manner that the vibration of a reed in the pipe of a flute produces a sound with a pitch dependent upon the natural rate of vibration of the reed. The vibrations of this column of air in the human throat are reinforced by the resonance of the chamber formed in the cavity of the mouth, in the same way that the sound produced in an organ pipe is reinforced by the resonance of the column of air within the pipe. Numerous attempts to produce artificial speech by mechanical means on the basis of these principles have met with a considerable degree of success.

It is evident that if a similar process of building could be applied to electrical waves, a resultant varying wave could be formed which would correspond to the variations of the voice. By the use of properly tuned circuits the phenomenon of electrical resonance would be brought into play, and greatly increase the strength of the transmitted currents. In this event it is extremely likely that the limits of the distances over which transmission of speech would be possible might greatly exceed those which prevail under the present method of varying the resistance of a circuit.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

INJURY FROM FALL OF INSULATOR.

A pedestrian on the sidewalk was injured by an insulator falling on him The insulator fell because hit by a stone thrown by a small boy in an adjoining alley. The party injured now threatens suit, claiming that the insulator would not have fallen if it had been properly fastened. The insulator was not broken in any way when picked up, so must have been loose or it would not have given away. Shall we settle the case? A. R.

YOU would do well to settle the case. The insulator would not have fallen had it not been hit by the stone; neither would it have fallen had it been properly secured. While your company is not responsible for the act of the boy, it is responsible for the security of the fastening of the insulator. The plaintiff would have the right to attribute the injury to either the boy's act or the company's act, or both. A settlement, if it can be secured on favorable terms, is therefore advisable.

LAWFUL HOUSE MOVING AND BREAKING OF WIRES.

A contractor moving a house along the highway broke down one of our wires that happened to be in his way. While it was done accidentally I believe he should pay our damages. This is so especially because the charter of our company imposes a penalty on any one who breaks our wires. The house mover claims he ought not to pay because he had permission from the city council to move the house. Now the charter authorizes us to recover the penalty and damages for the injury sustained. Is there any reason why we cannot do so? C. E

IT has been held that such a provision in a company's charter as you mention does not apply to the case of a defendant, who, in lawfully moving a house along the highway, breaks down a wire which happens to be in the way. If the contractor was negligent he would be liable for damages in spite of the charter provision, but if such was the case, you could not recover the penalty. See Telegraph Company vs. Wilt, 10 Pa., Law J. 375, 8 Leg. Int. 238.

THE QUEEN CITY HOME TELEPHONE COMPANY HAS BEEN REORGANIZED.

THE Queen City Home Telephone Company, of Cincinnati, O., has been reorganized and incorporated under the laws of Ohio, by Harry B. Gales, of Indianapolis, George W. Beers, of Ft. Wayne, and other Indiana men. It will be remembered that the Supreme Court of Ohio recently declared the former organization of the company invalid, because the incorporation laws of Ohio had not been fully complied with. The reorganization is to overcome this and the company will make another effort to get a franchise in Cincinnati. The new council is said to be favorable to the franchise.

EXEMPTIONS FROM TAXES.

THE state of Minnesota instituted proceedings against the Northwestern Telephone Exchange Company to obtain judgment for taxes. The company interposed the defense that it was exempt from taxes under the provisions of Chapter 314, page 581, general laws of 1897; that the company had paid the gross earnings tax provided by that act and that the property in question was necessarily used in connection with the operation of its business and not taxable by the ordinary methods. The trial court filed against the company and in effect, that the property was not necessarily used in the conduct of the company's business and was therefore taxable. By the constitution of 1896 the legislature was authorized to impose upon telephone companies, and there is a gross earnings tax upon any or all property owned by them in lieu of their taxes. Pursuant to this authority the legislature enacted that all companies in the state should pay the sum of three per cent. of their gross earnings which should be in lieu of all other taxes and assessments of whatever kind or nature upon all property held, owned or used by them in or about the construction, repair or operation of their business. The supreme court sustained the rule of the trial court and affirmed a judgment for the state. The lot upon which the taxes in question were levied adjoined the lot on which the central telephone exchange building of the company stands and is used for the purpose of storing telephone poles, material and supplies used in its business. It did not appear from the evidence that the company had no other place for storing such material. State vs. N. W. Telephone Exchange Company, 104 N. W. 1086.

ALLEGED FRAUDULENT RIGHT OF WAY CONTRACTS.

AT Bowling Green, Ky., a bill of complaint was filed November 21, 1905, in the Chancery Court by H. C. Moore and E. C. Dennison against the Long Distance Telephone and Telegraph Company. Complainants in the bill state that agents of the company offered to furnish service in Davidson and Williamson counties at $1.00 per month on an Independent line; that the agents represented to them that all of the land owners south of them and between them and Franklin had granted them a right of way and that all the franchises that were desired had been granted by the city of Franklin; that relying on these statements the complainants signed a paper granting the company a right of way. The bill in substance alleges that a fraud was practised on them because of the representation made and asks that the instrument executed be declared null and void and be cancelled and that the company be enjoined from disposing of, or pledging as collateral, the right of way obtained from Moore and that they be enjoined from entering upon the property or using the same in any manner. A writ of injunction was ordered as prayed for in the bill.

NEGLIGENCE OF PEDESTRIAN STRUCK BY WIRE WHILE CROSSING STREET.

A PEDESTRIAN in Lewistown, Pa., while attempting to cross one of the streets at a point other than the regular crossing, was struck by the wires of an electric light company and sustained injuries from which he died. The wires were attached to an arc light which on the evening of the accident had been lowered for repairs. An employee of the company, after lowering the light, left it in charge of a boy while he went to secure a file. During his absence a horse pulling a sleigh dashed around a corner and struck the wires attached to the lamp which then struck the deceased. At the trial of the case the defense was that the pedestrian was himself negligent in leaving the sidewalk and crossing the street at a place other than the regular crossing. The Supreme Court of Pennsylvania held, however, that unless the danger of crossing the street was manifest it was not for the court to say that the act of the pedestrian was negligent. Judgment for the plaintiff was accordingly affirmed.

Miller v. Lewistown Electric Heat & Power Co., 62 Atlantic 32.

IN THE OPERATING FIELD

TERMS OF MERGER OF INDIANA COMPANIES GIVEN OUT.

AT a recent meeting of the stockholders of the Home Telephone and Telegraph Company of Fort Wayne, it was determined that the purchase of the National Telephone Company, with its long distance telephone lines in Ohio, Indiana and Michigan, and its local exchanges in Sturgis, Kendallville, Auburn and New Haven, would be completed within the next sixty days. This was determined upon at a postponed meeting of stockholders of the Home Company, at which the tentative agreement submitted some time ago was ratified.

There were 4,430 of the 5,000 shares of Home stock represented at the meeting when favorable action was taken, and only the ratification by the National stockholders remains to complete the details for the merger. A meeting for this purpose will be called shortly. Payment of the purchase price will be made in preferred stock of the Home company, bearing 6 per cent. interest. It was also decided to create a new issue of bonds to take up outstanding securities, extending the time of the bonds from twelve years to thirty years. Holders of the present bonds will receive new bonds in exchange for their present holdings. The new bonds will bear a rate of interest identical with the old, but the securities will be of higher value because they insure a longer interest-bearing period, and for the reason that the security is increasing in value from year to year by reason of the expenditures for extensions and improvements. The new issue of bonds will be $250,000, and with the merging of the company extensive improvements are in contemplation. The movement is in the nature of a protective action, for the Independents, local and long distance, are in a very large measure dependent upon each other, and the new alliance will make a very strong combination.

The election of officers resulted as follows:

Directors—Charles S. Bash, John B. Reuss, William L. Moellering, M. B. Fisher, Isador Lehman, P. W. Smith, G. Max Hofmann, W. A. Bohn, George T. Fox. President, C. S. Bach; vice-president, J. B. Reuss; treasurer, Max B. Fisher; secretary and general manager, William L. Moellering; auditing committee, H. R. Freeman, H. H. Hartwig, G. H. Loesch.

A resolution was also adopted providing for the addition of five members to the board of directors.

MASSACHUSETTS LIKELY TO HAVE ANOTHER INDEPENDENT COMPANY.

AN order granting to the Home Automatic Telephone Company the right to own, operate and conduct a telephone business in Brockton, Mass., was recently presented to the aldermen and tabled. A conference will be held upon it within a few days.

Conditions imposed upon the company in the order include the following: The city shall have the right to place wires in one duct or conduit, providing the same are low tension such as are used for fire alarm or police signal service; the company shall indemnify the city for damages to person or property; the company shall begin none of its work until it has displayed and exhibited to the mayor that it is financially able to carry on the business it proposes to do and also shows a reliable list of subscribers; the company shall place a bond of $5,000 with the city as a guarantee of good faith; the company shall install a first-class system with modern equipment and cable construction; the company shall complete its preparatory work in two years and must have 300 or more subscribers at the end of that time; the company shall not charge in rates over $40 for an unlimited service telephone for business houses and not over $25 for unlimited service for residences; the company shall furnish to the city free of charge 15 telephones for city hall or other use within a mile of the telephone exchange, and shall install such others as the city may need at an established discount from the rate usually charged.

The order drawn, if passed, will give the company the right to construct conduits, erect poles and other equipment in the principal streets of the city.

INDEPENDENT COMPANY OF DULUTH ERECTS NEW BUILDING.

THE new central office building of the People's Telephone Company is nearing completion and it is expected that shortly after the beginning of this month the company's offices and exchange will be located in the new building. Since the work of building started two months ago a large force of men has been kept in constant employment.

It is the intention of the management to have the structure the most modern of its kind and absolutely fireproof. An up-to-date heating plant is being installed, and the installation of switchboard and terminal equipment is now under way. The offices will be located on the first floor and the basement will be used as a supply and machinery room. On completion of this work the company will be fully equipped to give its subscribers the best service obtainable.

MEETING OF WISCONSIN INDEPENDENT TELEPHONE MEN AT MILWAUKEE.

THE annual meeting of the Wisconsin Association of Independent Telephone Companies was held on December 21st. Among other subjects discussed were methods of meeting competition of the Bell company. As a number of the members of the Association were known to have executed contracts which made their companies sub-licensees of the Bell system, they were ejected from the association by vote of the other members.

It was stated at this meeting that the Bell company obtains its sublicensee agreements with smaller companies by threatening to establish rival exchanges and give free service to the public if an interchange of service is not conceded.

It was further stated that the law of the legislature placing cities of the state in sixteen classes and requiring a uniform rate in cities of the same class is being disregarded by the Wisconsin (Bell) Telephone Company on the ground that it is unconstitutional. Racine, Oshkosh and La Crosse are said to be in the same class, but the rates of the three are said to be $3 and $2 at La Crosse, $6 at Oshkosh, and nothing in some instances in Racine. Plans were discussed for obtaining a fund to be used in bringing suits against the Bell company under this law.

Richard Valentine, of Janesville, was re-elected president of the association; J. C. Kuoni, of Sauk City, was elected vice-president, and H. F. Goodrich, of La Crosse, was chosen to be secretary and treasurer, to take the place of H. C. Winter, of Madison, who has been in that position for several years.

The executive committee for the coming year is:

William Van Middlesworth, of Racine; Philip Sheridan, of Green Bay; J. C. Harper, of Madison; G. M. Hibescheid, of Arcadia; E. I. Bates, of Chippewa Falls; John M. Baer, of Appleton; W. I. Bell, of Deerfield, and J. C. Crowley, of Superior.

It was announced that thirty-nine new companies were formed in Wisconsin during the past year, with a capital of $415,000.

In addition to considering matters relating to the general movement the association adopted resolutions endorsing the present effort upon the part of Independent telephone interests to enter

Digitized by Google

Milwaukee. The resolutions cited that the Independent telephone companies are established all over Wisconsin; that they are corporations that have come to stay, and that Milwaukee should admit the Independent telephone interests.

ANNUAL CONVENTION OF THE NEBRASKA INDEPENDENT TELEPHONE ASSOCIATION WILL SOON BE HELD.

THE annual convention of The Nebraska Independent Telephone Association will be held in Lincoln, Tuesday and Wednesday, January 23, 24, 1906, with headquarters at the Lindell Hotel. This meeting is called at the request of the executive committee, W. E. Bell, G. T. Everett, F. E. Ebersole, C. W. Nunemaker and T. H. Pollock. An effort will be made to adopt some plan to harmonize the Independent telephone interests of the state. There are a great many important matters to be discussed and decided upon at this meeting and everyone who is in any way interested in Independent telephone development in this state or in adjoining states, is requested to be present.

A good programme and entertainment have been provided and a record breaking attendance is expected.

PROGRAM ANNOUNCED FOR THE MEETING OF THE ELECTRICAL SALESMEN'S ASSOCIATION.

THE Electrical Salesmen's Association has given out the program for its first regular annual meeting, to be held at the Grand Pacific Hotel, Chicago, January 20, 1906. At 9:00 a. m. the meeting will be called to order by Vincent Gray, president of the association. Following this will come the reading of the minutes of the previous meeting, the secretary's report, and then the report of Electrical Engineers and some suggestions, with E. E. Rines as chairman. After this will come the discussion of new business.

The afternoon program is as follows: 1:30 p. m. Our Purpose, President Vincent Gray; 1:45 p. m., Illustrated Address, J. Robert Crouse; 2:15 p. m., Modern American Meter Practice, R C. Lamphier; 2:45 p. m., Five minutes' addresses by a few of the members present, on Salesmanship; 3:15 p. m., Selection of next meeting place; 3:30 p. m., Meeting open for general discussion; 6:00 p. m., Adjournment; 6:30 p. m., Dinner; 8:00 p. m., All members are requested to be at the Coliseum at eight o'clock, where the Ladies' Tea Room has been placed at their disposal. They will also not forget to bring the ladies. Any information respecting the objects and organization of the association will be cheerfully furnished by Geo. H. Erich, the secretary, Room 51, 58 Washington street, Chicago, Ill.

INDEPENDENT COMPANY BRINGS APPLICATION FOR RIGHT TO OPERATE IN NEW ORLEANS BEFORE COUNCIL.

AT a recent meeting of the City Council of New Orleans, La., there was introduced an ordinance granting to A. Von Hoffman and his associates the right to establish and maintain a telephone system in the city for a term of fifty years. It is provided that within two years the company shall have the system in operation and at least 5,000 subscribers shall be served in the time mentioned. It is stipulated also that the company shall provide a branch exchange at the City Hall for the use of various departments free of charge and telephones furnished to the police stations and other places controlled by the city shall not exceed the rate of $25 for each telephone. It is provided further, the city shall have the right to purchase the plant and all belongings of the telephone company at the expiration of fifty years. The city is protected by bond and deposits and obligations to restore streets and sidewalks. An underground system of wires is provided. The following rates are fixed for subscribers:

When 5,000 telephones shall be in operation the rental for full metallic long-distance telephones shall be as follows: Residence rates, 5 cents for each outgoing call under sixty calls per month. No charge for city messages above sixty calls per month.

Business Rates—For telephone for incoming service, per month, $1.25; outgoing city calls, up to fifty calls per month, 5 cents each; additional city calls up to 150 per month, 2 cents each; additional outgoing city calls above 150 calls per month, 1 cent each; at all stations and to nonsubscribers each call within the limits of the city shall be 5 cents each. The company reserves to itself the right to make contracts with subscribers at a flat rate basis if so desired by the subscribers. The company shall give to the city a bond for $25,000.

The ordinance was referred to the Streets and Landings Committee.

ACTIVE STEPS BEING TAKEN TO INCREASE THE A. I. E. E. BUILDING FUND.

THE General Electric Company in view of the great importance and utility of the United Engineering Building in New York as a home and centre for the engineering professions and arts, has made a contribution of $25,000 to the land and building fund of the American Institute of Electrical Engineers. President C. A. Coffin, who takes a warm personal interest in the matter, has also sent his own check for $5,000. The committee, which has already received gifts and pledges amounting to nearly $70,000, is greatly encouraged by this generous support of its work. The fund is now, with other new subscriptions, well over $100,000, and with renewed energy the committee has begun its canvass of the field with the object of securing the second necessary $100,000. About 600 members have already subscribed to the fund, and the committee expects to have no difficulty in at least doubling this number. It has just issued to the whole membership a handsome pamphlet, illustrating and describing the new building in course of erection in New York City, and detailing the steps that have been taken by the associated engineering bodies to give effect to Mr. Carnegie's original gift.

OBITUARY.

IT is with sorrow that we announce the recent death of Stephen E. Abbott. Mr. Abbott was born in Andover, Mass., in 1876. He graduated from Tufts College in 1900, and immediately entered the employ of the New England Telephone and Telegraph Company. Later he went to the Rocky Mountain Telephone Company, carrying on work in Utah and Idaho, and about a year ago he joined the installing staff of the Dean Electric Company. It was immediately after he had signed a report covering work on the exchange at Potsdam, N. Y., of which he had charge, that he was seized with a stroke of apoplexy, and died almost instantly.

He was a devoted son, loved and respected by his friends, and a hard and faithful worker. His untimely death will be learned with grief and regret by many telephone men who have known him, and it has removed from the industry a valuable man.

EXTENSIVE IMPROVEMENTS BEING MADE AT BELLEFONTAINE, OHIO.

PROGRESSIVE measures are being taken in the development of the United Telephone Company's system in Bellefontaine, Ohio. This company is experiencing a remarkable growth which has necessitated the addition of three new sections to its switchboard. Comparatively mild weather has enabled the construction of several new lines to progress very rapidly and there are being installed a large number of new instruments for parties who have been on the waiting list for some time.

The toll line service of the Bellefontaine exchange will be greatly augmented when several new lines now under construction are completed. One of these will connect Huntsville with Bellecenter and another will reach Janesville. The exchange at Lake View is to be moved to new and larger quarters and a number of new subscribers will be secured in this vicinity

Digitized by Google

QUERIES

PHANTOM CIRCUIT.—(644.)

I have a toll line 54 miles in length. There are two different circuits on the same poles. One is a No. 12 iron wire circuit carrying 8 or 10 bridged stations. The other circuit is a No. 12 copper wire through circuit, with no stations on the line, which terminates at each end in a common battery exchange. I mention the iron wire circuit only to enable you to say whether it will be affected by the proposed arrangement of the copper circuit. Will you kindly let me know if I can arrange a circuit on the copper line, as shown in the attached diagram? If so, will it be a phantom or a simplex circuit? Will the coils be induction coils or repeating coils? C. F. L.

THE arrangement which you have submitted is called a "phantom" circuit and the coils at either end of the line are termed "repeating" coils. Your arrangement, Fig. 644*a*, a, will not be satisfactory because the phantom circuit employs an earth return and will therefore give no better service than an ordinary single-wire earth-return circuit. Grounded lines are al-

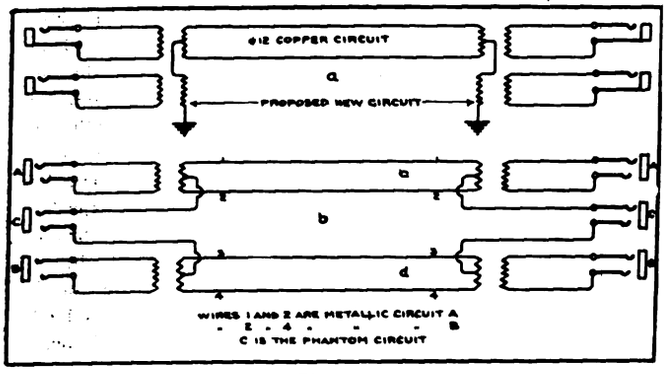

Fig. 644a.

most invariably noisy, because the inductive disturbances are greater than on metallic circuits and because grounded or earth-return circuits cannot be transposed.

You may also get considerable cross-talk between the phantom and the metallic iron circuit.

Figure 644*a*, b, shows the standard phantom arrangement, in which a metallic phantom is secured from two metallic circuits. The two component metallic circuits should be alike in all respects and should be on the same cross-arm and should also be adjacent to each other. Figure 644*b*, a, shows the relative pin positions which the two metallic circuits should occupy.

The circuits shown in Figure 644*a*, b, should be transposed; the metallic circuits should be transposed in the regular manner in which such circuits are usually transposed, by interchanging the

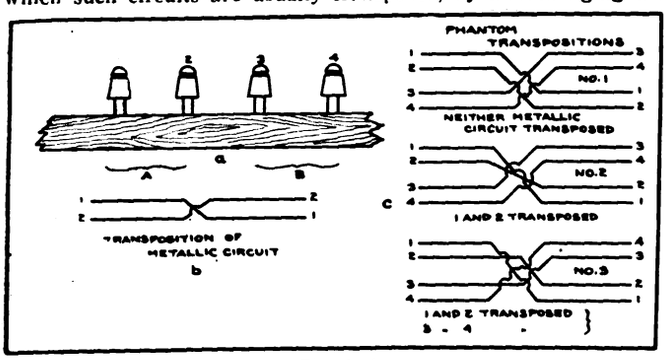

Fig. 644b.

two wires 1 and 2 or 3 and 4; then the two circuits A and B should be interchanged as a whole, wires 1 and 2 occupying the positions of 3 and 4 and vice versa. There is only one way of transposing two wires, but there are three ways of transposing four wires, and Figure 644*b* shows these different ways.

The component metallic circuits of a phantom may or may not be transposed at the phantom transposition, depending on which of the three methods in Figure 644*b* is employed. Only in No. 2,

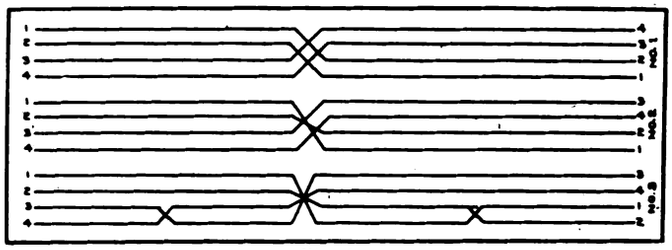

Fig. 644c.

Figure 644*b*, are the component circuits transposed. Figure 644*c* shows how the component circuits should be transposed to prevent cross-talk between them.

It is impossible to advise you how to transpose your phantoms without knowing how your metallic circuits are now transposed. You cannot obtain a satisfactory phantom by using both of your present metallic circuits because one is iron and the other copper. Intermediate telephones connected to either circuit will not interfere with the phantom if they are connected at points midway between the two nearest metallic and the two nearest phantom transpositions.

Phantom circuits are as efficient as the metallic circuits of which they are composed. They are subject to cross-talk and inductive disturbances just as metallic circuits are, and must be transposed to get rid of induction from lighting or power circuits carrying alternating currents.

The principles that apply in transposing metallic circuits also

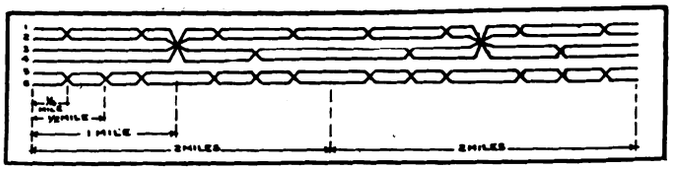

Fig. 644d.

apply in transposing phantom circuits, although the introduction of phantom transpositions may upset the previously existing relations between the metallic circuits, because the latter change their pin positions in a phantom transposition.

A grounded phantom circuit will be noisy and may cross-talk with the other circuits for the same reasons that obtain with an ordinary grounded line, which employs only one line wire and an earth return. Phantom circuits, to be satisfactory, must be transposed and balanced as carefully as a metallic circuit, having two line wires.

Should you string another copper metallic circuit, a good phantom can be obtained if the new wires are of the same size as those now existing. It will be sufficient to transpose the phantom every two miles, if there are only three circuits. Figure 644*d* shows a satisfactory method when there are three circuits; the method there given, is a two mile section or unit, of which sections there will be 27 in your 54 mile line. The intermediate telephones on your iron circuit should be connected as nearly as possible at the 2-mile points, or where two sections join. If a telephone should be connected midway in a section it will probably not introduce cross-talk of a serious amount, but an absolute balance in such a case could be obtained by shortening, for example, the 2-mile section, east, of the telephone station and lengthening the section west of the station.

Only one such grounded phantom circuit as you propose is possible on one pole line, because two such circuits will cross-talk so badly that only one circuit can be employed at one time.

TELEPHONE PATENTS

MULTIPLEX TELEPHONY.

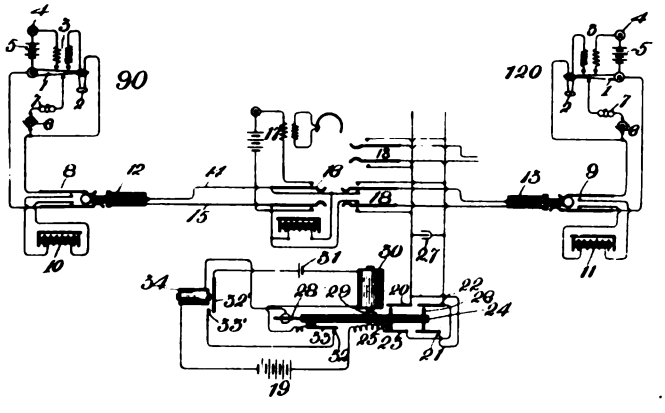
Albert Gould Davis, Washington, D. C., patents (No. 808,438, dated Dec. 26, 1905, filed April 22, 1897; serial No. 633,258) a system for multiplex telephony.

This invention discloses means for transmitting two or more messages over the same wire at the same time. As many generators of high frequency currents are bridged across the line wires as there are stations. The apparatus at each station is tuned to respond to only those currents which emanate from a similarly tuned generator. This is accomplished by means of condensers and inductance coils in series with the receivers and transmitters. The transmitters are made in the form of condensers, the compression of the plates, due to the air waves from the voice of the person talking, varying the capacity of the transmitter circuit. Thus if there are bridged across a line four distinct stations, *A*, *B*, *C*, *D*, four separate and distinct generators, A^1, B^1, C^1, D^1 would be necessary, each furnishing alternating currents of different frequencies, which should, however, be either above or below the audible limit, otherwise they would be heard in the receivers. If a line carrying four similarly tuned stations, A_1, B_1, C_1 D_1 is connected thereto, then station A will be able to talk to station A_1 without interfering with the other stations. The same hold goods for the other stations.

POLE CHANGER.

Harry O. Rugh, Chicago, Ill., patents (No. 807,870; dated Dec. 19, 1905; filed June 2, 1902; serial No. 109,841) and assigns by mesne assignments to Edward C. Hennis of Sandwich, Illinois, a pole changing device.

In this invention means are set forth for the design of a pole changer for ringing telephone bells. A pivoted armature 24 carries contact points 25 and 26 which are arranged to engage alternately with contacts 20, 22; 23, 21. An electromagnet 30 is provided to vibrate the armature and includes in circuit a battery 31, contacts 32^1, 33^1 of relay 34, and contact 33. The line wires to the ringing key terminate at diagonally opposite contact posts 20, 21; 22, 23, so that in one position of the armature



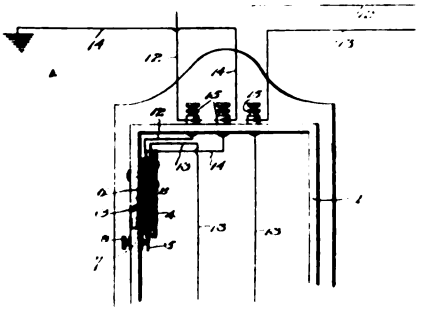
if the key 18 is operated the tip of the cord would connect with contact 25 and the ring with 26, and when the armature assumed the alternate position the connections between the tip and ring and the contacts 25, 26 would be reversed. Contacts 25, 26 constitute the terminals of the ringing battery circuit which is completed over the line and through the bells to be signalled. By tracing the circuit the path taken by the ringing current will be evident. The passage of ringing current to the line through the coils of magnet 34 causes it to attract its armature. The closing of contacts 32^1, 33^1 completes the circuit through local battery 31 and electromagnet 30. There results a movement of the arm 24 which is kept in vibration through the alternate opening and closing of the local battery circuit at contacts 32, 33. The purpose of introducing the electromagnet 34 into the circuit is to prevent the operation of the arm 24 at such times as the ringing key is not in use.

The condenser 27 is provided to smooth the alternations caused by the reversal of battery current.

SIGNAL SWITCH.

George H. Manners, Murray, Nebraska, patents (No. 807,626; dated Dec. 19, 1905; filed March 2, 1905, serial No. 248,140) a signal switch.

This invention relates to party line operation and provides



means whereby a subscriber can call either another party on the same line or the exchange at will. To accomplish this result three springs, 3, 5, 4, are mounted upon a plate 6, each spring being insulated from the other. A button 8 serves as the operating mechanism. Normally the contact springs 3 and 5 are in engagement and a complete metallic circuit is formed. Should it be required to use the ground as one side of the circuit, the button will cause the spring 5 to open its contact with 3 and close it with 4, which constitutes the ground terminal in circuit with post 15 and ground wire 14. A single claim is made in the patent, covering the arrangement and connection of contact springs in accordance with the above description.

TELEPHONY.

Albert G. Davis, Schenectady, N. Y., patents (No. 808,600, dated Dec. 26, 1905; original application filed April 22, 1897, divided and the application filed May 15, 1903; serial No. 157,246) a telephone system.

This is a subdivision of a patent filed April 22, 1897, and deals with the transmission of sound by means of suitable apparatus devised to increase or decrease the resonance of a tuned circuit.

The essential features of the patent are set forth in seven claims, two of which are given herewith:

Claim 1. The method of creating a telephonic current, which consists in impressing an alternating electromotive force on a circuit and varying the reactance of the circuit around a point near but not at the resonance-point in substantial accordance with the sound to be transmitted.

Claim 7. The method of multiplex telephony which consists in progressively varying the resonance of a plurality of branch circuits or local circuits, tuned to different frequencies, by the action of transmitters which furnish the inductance for said circuits, in accordance with the sound waves to be transmitted.

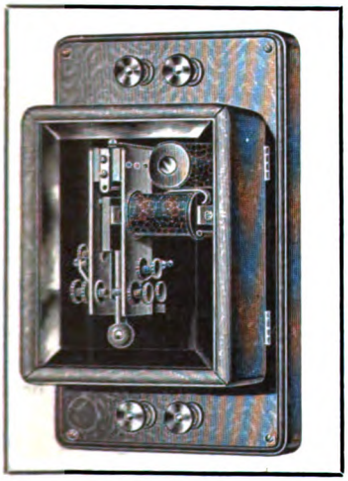
"DO YOU GET OUR RINGS"

NON-INFRINGING.

To Those of Our Customers Who Have Already Inquired and Those Who May Desire to Know:



That the Sandwich Pole-Changer, "while its appearance in the cut is strikingly similar to the Illinois," it is a very different and much better instrument. The Sandwich Pole-Changer Company is not the successor of the Illinois Electric Specialty Company. They simply purchased the tangible property of the Illinois Company last June, who had been doing business at a loss for several years, and this is the reason why *their suit went by default.*

The Sandwich Pole-Changer was put on the market by E. C. Hennis, who employed the most careful and able Patent Attorneys to see to it that this instrument was absolutely non-infringing, and it infringes no patent, then or since issued on Pole-Changers.

The Sandwich Pole-Changer Company is strongly backed financially, and is placing these instruments on the market by the hundred each month, and will protect the interests of its customers and users, as well as its own, to the end.

The Sandwich Pole-Changer is an up-to-date instrument made by the best of mechanics, of first class material. Sent on thirty days' free trial, and is in the market to stay.

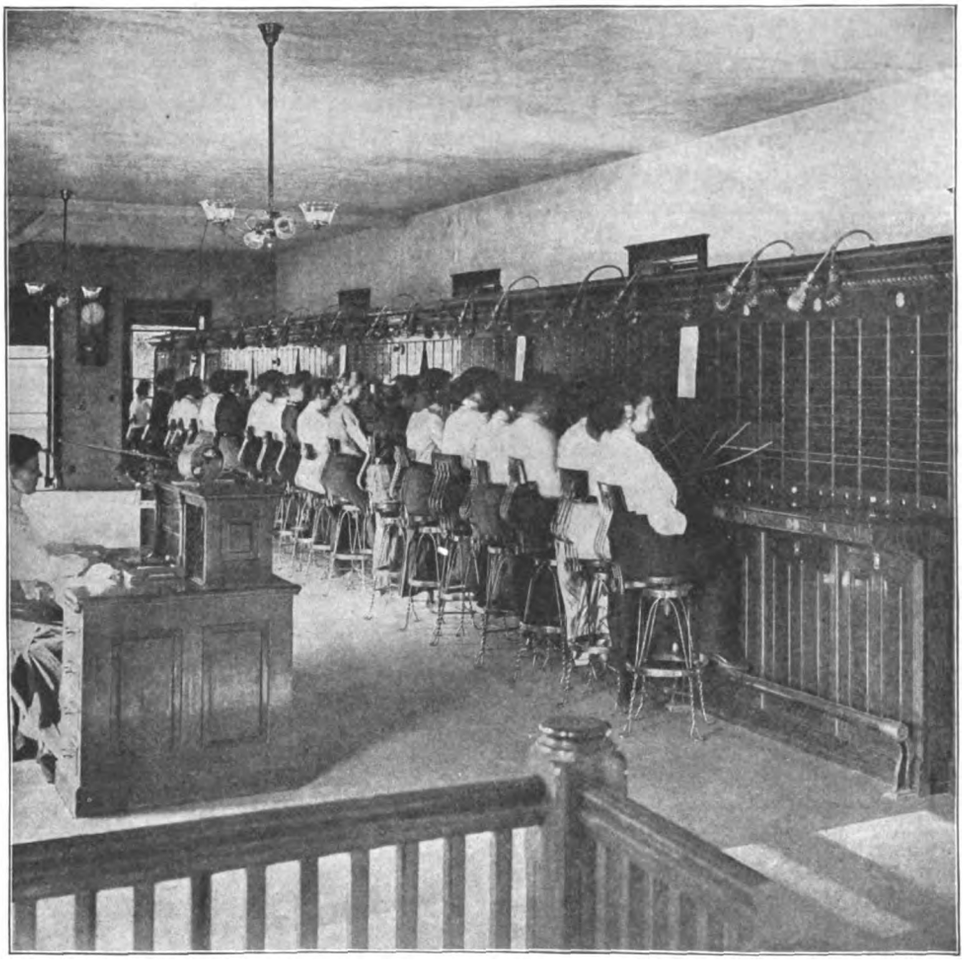
IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

COMFORT IMPROVES EFFICIENCY.

MECHANICAL ingenuity has done much toward the improvement of telephone apparatus in general. It has simplified the work of the operator and has also been instrumental in adding to her comfort while at work. Such a simple device as an operator's chair would not appear to readily lend itself to improvement, yet a thorough examination of the old wooden type will show that it is not all it should be. It is cumbersome, difficult to keep clean, and much too heavy to be handled by the ordinary operator. These faults led to the design of a metal chair which is now rapidly superseding the wooden type. It is neat and durable, comparitively light in weight, and can be kept scrupulously clean with the minimum amount of attention. A chair having all these features is being placed on the market by the Electric Appliance Company, of Chicago. Amongst recent orders was one from the Interstate Telephone and Telegraph Company, for its Peoria exchange. A view of the operating room showing the chairs in use is given herewith. These chairs have adjustable spring backs, and adjustable seats, which can be readily raised and lowered. The edges of the seats are bound with metal. A special quality of steel wire is used for the framework, which, while reducing weight as much as possible, also offers the rigidity necessary for retaining its special shape. An oxidized finish gives these chairs a most attractive appearance and provides a surface which is not easily marred. Prices and full particulars respecting this article of exchange furniture can be obtained from the manufacturers upon request.



Metal Chairs Make Operators Comfortable and Increase Their Efficiency.

Especial attention is directed to the design of the chairs, which provides a form contributing greatly to the comfort of the operators. Comfort means freedom from fatigue, and an operator who does not get tired is bound to give good service.

THE BAIRD MANUFACTURING COMPANY is installing its secret service rural and party line system in many parts of the country and adding a large number of new exchanges to its list. Amongst the latest are Belle Plaine Telephone Company, Belle Plaine, Minn.; Henderson Telephone Company, Henderson, Minn., and Piper City Telephone Company, Piper City, Ill. It is very apparent that the Baird lock-out has come to stay. This will be good news to the many operating companies who are bothered continually with complaints of poor transmission caused by "listening in" on party lines, and particularly to those who are confronted daily by the difficulties resulting from rural line subscribers forgetting to hang up their receivers.

THE DEAN ELECTRIC COMPANY, of Elyria, Ohio, has received a contract from the Central Telephone Construction Company, of Wauseon, Ohio, for a complete common battery exchange equipment for Mobile, Ala. The switchboard is of five thousand lines ultimate capacity and is to have a present equipment of twenty-one hundred lines. This contract also includes the chief operator's, monitor's, and wire chief's desks and one thousand telephones. The new Dean 4-party harmonic selective ringing system is to be installed, individual indicating ringing keys being provided in each operator's position, also three sources of harmonic ringing current, two of which are the new Dean Harmonic Converter and the other a regular power ringing machine. In addition to this large item, the Louisville Home Telephone Company, of Louisville, Ky., has placed an order for two (2) complete common battery switchboard equipments, one for the Pewee Valley exchange and one for its Anchorage exchange. These switchboards are to be equipped with individual indicating ringing keys for Dean 4-party harmonic selective ringing, the source of ringing current being the new Dean Harmonic Converter. The Dean Company is to supply telephones for both of these new exchanges. The receipt of numerous large orders similar to these indicates that the company furnishes most satisfactory apparatus.

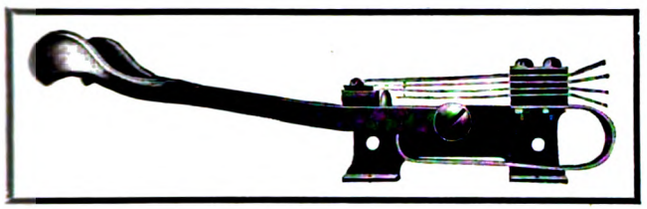
TROUBLE and HOOKS *Have always been inseparable*



No part of the telephone receives harder usage or more abuse. Long has it been known that SUMTER Hooks were "all right."

And now we offer a new one. Here are some of its features:

1st—Hook lever easily removable without removing escutcheon plate or changing adjustment of contact springs.

2nd—No circuit through hook lever, hook spring, or joint. Hook lever thoroughly insulated, no possibility of receiving a "shock."

3rd—Contact springs are long and flexible and are pointed with genuine platinum. They are held under tension and come to rest on a rubber block; when the receiver is removed from the hook, there is **no lost motion** to overcome.

4th—There is a rubbing contact between the different springs, and the contact points bite into each other.

5th—Every part is die made and interchangeable.

6th—The hook lever is a heavy brass **casting**, graceful in design.

7th—Like all good things this is well finished. **Every** part is heavily nickeled or oxidized, and is made the best we know how to make it, and—**WE KNOW HOW.**

THE SUMTER TELEPHONE MFG. CO. = = SUMTER, S. C., U. S. A.

SERVICE IS THE ONLY TEST FOR DRY BATTERIES

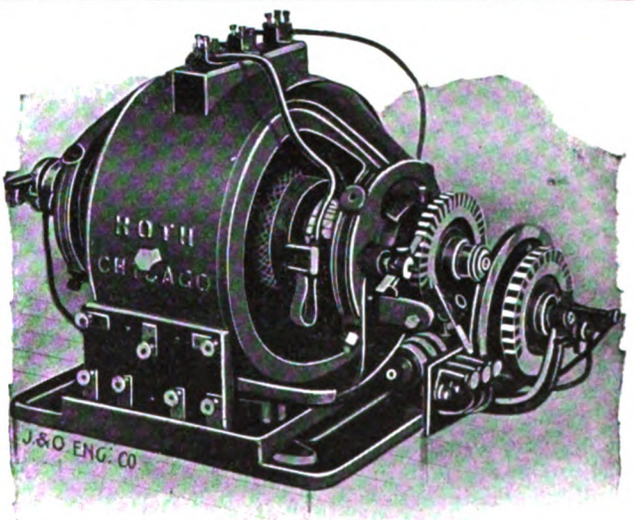
The 1900 gives a large current and has long life, shows great recuperation and practically no internal action.

A test will convince you that the 1900 will save you money and save you trouble.

A test is inexpensive.

Stromberg-Carlson Telephone Mfg. Co.

General Offices, Rochester, N. Y.
Branch Sales Office, - Chicago



Dynamos and motors for telephone power plants are our specialty.

We make them for any usage and with any capacity.

They are economical in operation and low in maintenance.

There is no guesswork about their design and every piece of material used in their construction is the best than can be secured.

They are easily kept in adjustment and will stand more hard usage than any similar machine.

When in the market write us; it will pay you to get posted on the subject. Catalogues and bulletins are yours for the asking.

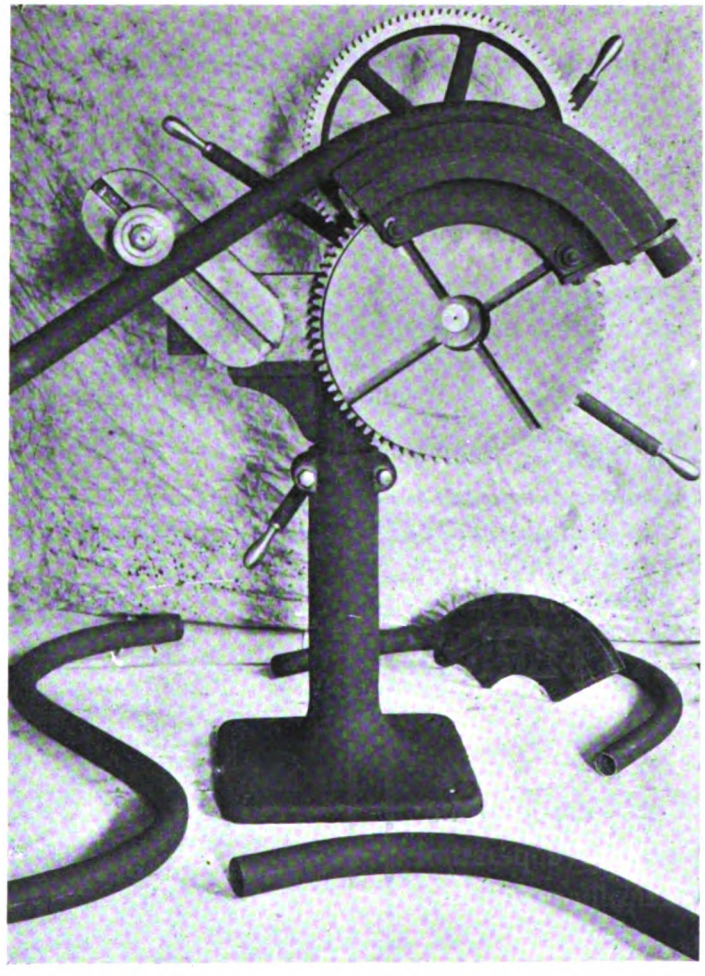
IN THE MANUFACTURING FIELD

A NOVEL PIPE BENDING MACHINE.

IN the regular course of his labors the telephone installer is called upon to accomplish certain work with which he is not familiar. Regulations of many modern buildings require that all wires shall be laid in conduit. This frequently necessitates the bending of conduit tubes to enable them to conform with a specified route which the wires must take. Pipe bending is a difficult operation and requires both skill and strength for its correct consummation. Realizing this, the firm of Pedrick & Smith, of Germantown, Pa., has recently brought out a pipe bending machine which greatly simplifies the work involved. This device is illustrated herewith.

The stand is telescopic and can be raised or lowered as desired. The portion carrying the mechanism can be revolved in any direction. A universal section or arm is provided so that if so desired, the bending device can be placed in a horizontal position.

The machine is operated by a hand wheel consisting of four handles which by means of compound gearing engages the face plate to which are attached the bending quadrants. The pipe is held in the quadrant at one end by a steel plate, while the resistance stud on the movable arm to the left engages the pipe at another point. Various curvatures are obtained by adjusting the position of the resistance stud in the "T" slot of the arm which has a swing of three-quarters of a circle.



Machine for Bending Conduit Pipe.

Quadrants are furnished for 1-inch pipe with a radius of 6 inches, for 1¼-inch pipe with a radius of 9 inches, for 1½-inch, with a radius of 12 inches, and for 2-inch pipe with a radius of 14 inches. While these four quadrants are furnished with the machine, it has been found that the smaller sizes of pipe can be very readily and satisfactorily bent with the larger size quadrants. In fact, workmen will not take the time to change the quadrants unless they desire a shorter radius than the larger quadrants will give them. The gearing is compound with a ratio of 25 to 1, thus giving the machine a powerful leverage. A boy can bend 2-inch pipe with little effort. With this type of bending machine, piping of steel, iron, brass, copper or other material can be bent cold up to and including 2 inches in diameter. It is also adaptable by means of special formers for bending light angles, flats or tee bars.

For companies which are called upon to use much conduit this machine will be found of great value, as it not only accomplishes the work in a very satisfactory manner, but is also a great deal quicker in operation than any other. Further particulars will be furnished by the manufacturers.

GEO. R. BLACKBURN, Cleveland, O., is mailing a descriptive folder and samples of the Blackburn ground clamp, and telephone companies having ground connections to make will be benefitted by requesting a sample. The superintendent of one of the largest telephone companies in the United States has written to MR. Blackburn: "We have made an extensive study of ground clamps, and wish to say that the sample you have submitted is superior to any other clamp."

THE AUTOMATIC ELECTRIC COMPANY, of Chicago, will show at the Electrical Trades Exposition its automatic telephone system such as has been adopted in Chicago and a large number of cities in the United States, in Canada and in Havana and Mariano, Cuba.

There will be on exhibition in the Automatic Electric Company's booth No. 20, Section C, a complete automatic telephone exchange of the 1,000 line type, with telephones connected. This automatic telephone system has been adopted in over seventy-five cities in the United States. The public exchanges range in size from 100 to 20,000 lines. There are a number of private exchanges ranging from 10 to 200 lines.

THE DE VEAU TELEPHONE MANUFACTURING COMPANY, of New York, will have an interesting exhibition at the Chicago Electrical Show, January 15 to 27. There will be shown a comprehensive line of instruments of the regular types manufactured by this company. These will include the well-known Automatic Switchless telephones, and a large number of different types of instruments for hotel and other intercommunicating systems, as well as instruments designed especially for marine service. The company will also exhibit switchboards of standard design for different classes of service.

FINANCIAL.

GAINESVILLE, FLA.—The East Florida Telephone Company has declared a fifth annual dividend of 2½ per cent.

ANGOLA, IND.—The Steuben County Telephone Company has increased its capital stock to $100,000.

ELYRIA, O.—The Elyria Southern Telephone and Toll Company has increased its capital stock from $40,000 to $75,000.

TOLEDO, O.—There was recently consummated a sale of $50,000 of Toledo Home Telephone bonds to a St. Louis syndicate. The price paid was 92¾ net.

SEATTLE, WASH.—The Independent Telephone Company has declared its first dividend of 5 per cent.

FRANCHISES.

HYMERA, IND.—The Hymera Telephone Company, whose franchise was repealed, has been granted a new franchise to construct and operate a telephone system in Hymera.

COVINGTON, KY.—A franchise has been granted to the Citizens' Telephone Company.

ANGELICA, N. Y.—The Inter-Ocean Telephone and Telegraph Company, of Buffalo, has been granted a franchise to build a toll and local telephone line in Angelica. The new line will connect with the long distance line at Friendship.

EAST GRAND FORKS, N. D.—The Tri-State Telephone Company, of Minneapolis, has applied for a franchise at East Grand Forks, and expects, also, to be granted one at Crookston.

NEW LEXINGTON, O.—A new telephone franchise has been granted to J. B. Rhodes, of Zanesville, and T. J. Smith, of New Lexington. A new company is to be organized, to be known as the New Lexington Telephone Company. It is the intention of the company to build an up-to-date plant throughout the city.

COLFAX, WASH—The Automatic Telephone Company, of Tacoma, is seeking a franchise in Colfax.

MILWAUKEE, WIS.—The amended franchise of the Registering Telephone Company, represented by Albert Hoffmann, has been introduced in the council and referred to the committee on judiciary.

BRANTFORD, ONT., CAN.—The Automatic Machine Telephone Company has been granted a twenty-one-year franchise in Brantford.

COMBINATIONS.

KINGMAN, IND.—The telephone plant at Ogden, Ill., has been acquired by Jas. A. Terrel, of Kingman, Ind.

MINEOLA, IA.—The Independent Telephone Company, of Council Bluffs, has acquired the telephone exchange at Mineola. C. F. Nipp, one of the former proprietors of the Mineola Exchange, will remain in charge as manager.

AUBURN, N. Y.—Connection was completed Tuesday by the Farm and Village Telephone Company with Auburn. This gives local subscribers direct communication with Rochester, Buffalo, Syracuse, Oswego and intervening points. The Farm and Village Telephone Company now contemplates extending its system to meet the lines of the Poplar Ridge and Union Springs systems.

CANTON, O.—Messrs. Hoskins and Washburn have acquired possession of the United Telephone and Switchboard Company. J. C. Hoskins is the new president and R. B. Washburn secretary and treasurer.

ELECTIONS.

PROPHETSTOWN, ILL.—M. P. Hill has been elected president of the Prophetstown Mutual Telephone Company.

FINCHFORD, IA.—The Finchford Mutual Telephone Company has elected the following officers: President, C. H. McBride; vice-president, John Silver; secretary, G. A. Evenson; treasurer, W. S. Beaty.

MIDDLEFORK, IND.—The Middlefork Telephone Company has elected the following officers: President, Eugene Floyd; secretary, E. M. Catron; treasurer,, W. D. Thomas; general manager, J. Catron.

PENN YAN, N. Y.—The Milo Telephone Company has elected the following officers: President, A. C. Townsend; vice-president, J. A. Stone; secretary, M. L. Spooner; treasurer, A. Longwell: manager, J. J. Gardner.

CINCINNATI, O.—The Queen City Home Telephone Company has elected the following officers: President, G. W. Beers; vice-president, C. B. Wing; secretary and treasurer, H. P. Gates.

NEW COMPANIES.

CORNERVILLE, ILL.—The Saline and Hamilton County Mutual Telephone Company, Cornerville, has been incorporated with a capital stock of $1,000. Incorporators: O. A. Tate, J. L. Harris and W. H. Johnson.

LAKEWOOD, ILL.—The Lakewood Telephone Company, Lakewood, has been incorporated with a capital stock of $2,500. Incorporators: Chas. H. Duckett, J. E. Bowman and E. A. Weakley.

MAURICE, IA.—The Sherman Telephone Company has been incorporated with a capital stock of $2,000. Its principal place of business will be Maurice. Incorporators: J. C. Emery, Geo. R. Moir, Arie Van Wyck, K. K. DeJong, Wm. Brink, Henry Siege and Joe Rexwinkel.

HAYS CITY, KAN.—The Hays City Telephone Company has been incorporated with a capital stock of $25,000.

MENLO, KAN.—The Menlo Telephone Company has been incorporated with a capital stock of $3,000.

PALCO, KAN.—The Palco Telephone Company has been incorporated with a capital stock of $8,000.

PERU, KAN.—The Penmar Telephone Company has been incorporated with a capital stock of $5,000.

MANKATO, MINN.—The East Medo Telephone Company has been organized, and will make connections with the Mankato Citizens' Telephone Company.

KIRKSVILLE, MO.—A new Independent Telephone Company has been formed at Kirksville, and will install an exchange there.

HANNIBAL, N. Y.—The Hannibal & Martville Telephone Company has been incorporated with a capital stock of $1,000. The directors are: John F. Flint, Julius P. Rhodes, George Van Noate, George Crofoot, Maurice Palmer and James E. Gillis, of Hannibal, and Bert Howland, of Martville.

SCHENEVUS, N. Y.—The Davis and Rose Telephone Companies have consolidated, and in the future will be operated under one management. The new company has not yet been named. It is capitalized at $30,000. Under the new management the Worcester exchange will be built over and rural lines run to Decatur, South Valley, East Worcester and other points. An exchange is being installed at Pleasant Brook, and the line from Schenevus to Westville has been completed.

CARTHAGE, N. C.—The Carthage Telephone Company has been chartered with a capital of $5,000 by W. C. Petty and associates.

ROSEBORO, N. C.—The Roseboro and Fayetteville Telephone Company has been chartered to operate lines between these two towns, and in other sections, with $10,000 capital. A. M. Brittain is among the stockholders.

RUSSELL, N. D.—The Russell Telephone Company has been incorporated by G. F. McKnight and others with a capital of $5,000. A local exchange will be installed.

CALDWELL, O.—The Citizens' Telephone Company has been organized with a capital of $30,000. The directors are: M. W. Kuntz, L. R. Wheeler, Edward R. Spannagel, H. R. McClintock, J. A. Lemmox and J. H. Sparling. Options have been secured on the property of the Farmers' Exchange Telephone Company and the Summerfield Telephone Company.

SOUTH POINT, O.—The South Point Telephone Company, South Point, has been incorporated with a capital stock of $1,800. Incorporators: T. Ferguson, C. H. Brubaker, R. E. Kouns, John A. Ankrim, C. W. Ankrim.

NEWS—WANTED

THE matter contained upon the Message and Operating Field pages of this paper is contributed largely by our special correspondents. We believe, however, that there are many valuable items of telephonic interest which are never brought to the attention of the public. There is no reason why this condition should exist, and the Editor, therefore, invites all telephone companies, and the officials of such companies, to furnish any information that they can consistently make public relative to financial statistics, new construction, elections, franchises and personal items.

THE WEEK'S MESSAGES

TOLEDO, O.—The Western Ohio Telephone & Telegraph Company, Toledo, O., has been incorporated with a capital stock of $100,000. Incorporators: John Neilink, A. C. Stevenson, F. E. Paler, J. F. Davis, J. Lindall.

DUTTON, OKLA.—The Dutton Telephone Company has been incorporated with a capital stock of $5,000. Incorporators: Edgar Diehl, C. C. Fishes, Oliver F. Pruitt and O. L. Frain, of Dutton, and E. G. Cornett, of Verden.

MONTOUR FALLS, N. Y.—Frank Johnson and George F. Barton are interested in the formation of an Independent Telephone Company at Montour Falls, to be known as the Montour Telephone and Telegraph Company.

RINGWOOD, OKLA.—The Glenwood Rural Telephone Company, of Ringwood, has been incorporated with a capital stock of $400.00. The incorporators are: E. Frasier, L. A. Jonson and G. H. McDearmott.

BOYERSTOWN, PA.—The Mountain Telephone Company, to operate in southern Berks County, has been organized by local farmers and merchants. Work on constructing the lines will be begun at once.

BEAUFORT, S. C.—The People's Telephone and Telegraph Company, of Beaufort, has been incorporated with a capital stock of $15,000. The incorporators are R. E. Long, George Holmes and F. W. Scheper.

MILLER, S. D.—The Hand Telephone Company, of Miller, has been incorporated with a capital stock of $10,000, with the privilege of increasing it to $20,000. The incorporators are E. R. Waite, W. J. Holbaum and G. D. Richardson.

SIOUX FALLS, S. D.—The Sioux Falls Rock Telephone Company has been incorporated with a capital stock of $5,000. Incorporators: Joseph D. Hofer, Anna Hofer, A. A. Wipf and John Wipf.

MOUNTAIN CITY, TENN.—The Mountain City Telephone Company, Mountain City, Tenn., has been incorporated with a capital stock of $5,000. Incorporators: J. W. Tipton, R. E. Donnelly, J. M. Lacy, L. F. Miller and J. L. Curtis.

PERSONAL.

L. D. BRENNER has been appointed manager of the Central New York Telephone Company's exchange at Rome, N. Y.

H. K. COLE, of the Kentucky and Indiana Telephone and Telegraph Co., of Owensboro, Ky., is now a member of the Kentucky legislature.

JAMES P. HOWATT has been appointed manager of the exchange at St. Cloud, Minn., by the Northwestern Telephone Company.

J. J. MALONEY, formerly manager of the Northwestern Telephone Company's exchange at St. Cloud, Minn., will take charge of the exchange at Albert Lea.

R. S. MITTEN, who has been general sales manager for the Eureka Electric Company of Genoa, Illinois, for the past three years, has severed his connections with that company and has taken a position with the Electric Appliance Company of Chicago to assist Mr. S. A. Dinsmore, manager of the telephone department. He will have charge of the correspondence of the departmnt.

O. MORSEMAN, the well-known sales representative of the Kellogg Switchboard and Supply Company, is being congratulated upon his skill with the rifle. On a recent outing he demonstrated his ability to always bring back the goods by getting three deer with only the same number of shots.

H. H. NICHOLSON will be promoted to division superintendent of the division which includes the districts of Cooperstown, Watertown and Utica, by the Central New York Telephone Company. He will have his headquarters in Utica.

E. S. VINES has been appointed special agent for the division of the Central New York Telephone Company, which has its headquarters at Utica.

H. A. WADE has been appointed manager of the Peekskill exchange of the State Line Exchange Telephone Company.

MISCELLANEOUS.

HICKMAN, NEB.—The Hickman Telephone Company has recently completed its system. The company starts with over 100 subscribers, and will connect with systems at Lincoln and other neighboring towns.

TOLEDO, O.—The Toledo Home Telephone Company has secured the contract for installing a private telephone system in the thirty-seven school buildings of the city, the company agreeing to install the system for $1,000 a year, the company also to furnish the operator, and the exchange to be located for the present in the Home building. The board of education has looked with much favor on the proposition for some time, in that school business will be facilitated to a very great extent, and much of the dismissing of pupils from school to deliver messages to the office of the board will not be necessary when the exchange is once installed.

CAVE CITY, TENN.—During a recent fire at Cave City, the Telephone Exchange owned by George T. Tucker was damaged to the extent of $2,500.

PULASKI, TENN.—Having withdrawn its application for a franchise in the town of Pulaski, it is now announced that the Long Distance Telephone Company will buy property on East Hill, outside the corporate limits, and establish an exchange there.

New Construction in the Field

DECATUR, ALA.—The Morgan County Telephone Company is building long distance lines to Mobile, Nashville and Memphis.

MERIDIAN, IDAHO.—The Independent Telephone Company has extended its Meridian line to Kuna.

CHRISMAN, ILL.—The Wabash Valley Telephone Company is overhauling its system.

MARSHALL, ILL.—Extensive repairs on the local telephone system are being made by the Kinloch Telephone Company.

STREATOR, ILL.—The Streator Telephone Company expects to make improvements in its system.

BADGER, IA.—The Badger Telephone Company is to build a number of farmers' lines.

FLORA, IND.—The Flora Telephone Company is to install a new switchboard.

MALVERN, IA.—The Mills County Telephone Company has under consideration a great number of improvements in its system.

TABOR, IA.—The Tabor Telephone Company is building a line from Silver City to Mineola.

PARIS, ME.—The Woodstock and Paris Telephone Company is to extend its lines to South Paris to connect with the Citizens' Independent Telephone Company of Paris.

CHESTER, MASS.—A. L. Lewis and others, of Chester and Blandford, are to build a telephone line from Chester to North Blandford.

ALBERT LEA, MINN.—The Tri-State Telephone and Telegraph Company, of Minneapolis, is to install an exchange at Albert Lea.

KANSAS CITY, MO.—The Kansas City Home Telephone Company is to install another branch exchange.

SAUK CENTER, MINN.—The Northeastern Telephone Company is building out from Belgrade on the Soo line, and expects to extend its line to Sauk Center, using jointly the poles of the Pleasant Valley Company a portion of the way.

MACON, MO.—The Macon Telephone Company is to overhaul its entire system and bring its construction up to a high standard.

ASHEVILLE, N. C.—The Asheville Telephone Company is to construct an underground system.

ARCADIA, O.—The Arcadia Mutual Telephone Company is to build a toll line from Arcadia to Van Buren.

COLUMBIANA, O.—The Columbiana County Telephone Company is extending its lines to take in Ross Meadows, Cannons Mills and vicinity.

CANONSBURG, PA.—The Farmers' Mutual Telephone Company is considering the advisability of extending its lines into Amwell township, taking in Lone Pine, the township seat, and other points in that section.

MARKLESBURG, PA.—The Woodcock Valley Telephone Company, which has just completed a new line from Marklesburg to Entriken and Newburg, expects to extend its lines to other points.

SPRINGTOWN, PA.—The Franklin Telephone Company is installing many new telephones.

WEST ALEXANDER, PA.—The National Telephone Company is making extensions to its system. It will connect with the Claysville Telephone Company, which is installing a complete telephone system in West Alexander. The Claysville Company will also have a farmers' system in the near future.

SCOTLAND, S. D.—The Scotland Telephone Company is building a rural line.

MONTREAL, QUEBEC, CAN.—The Grand Trunk Pacific Railway Telegraph Company is seeking incorporation with powers to build telephone lines in addition to telegraphs. W. H. Bigger, Montreal, solicitor.

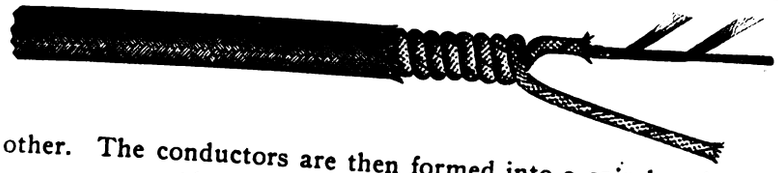
THE CORD THAT LASTS.



This cord consists of two steel piano wires covered with a spiral of fine copper wire. The cord is then insulated with a silk and cotton insulation and each conductor is covered with a cotton braid, one of the conductors having a red tracer so as to distinguish it from the other. The conductors are then formed into a spiral and covered with a heavy, waxed, gray Gilling Thread.

"EACO" STEEL SWITCHBOARD CORD

will outlast anything on the market. Write and get prices, and when doing so state what make of switchboard you are using.

ABOUT MAGNET WIRE

"NORTH'S" magnet wire is made from perfectly soft copper wire, equal to or greater than 98 per cent. of the conductivity of pure copper. It is drawn with a uniform diameter throughout, of perfect cross section and from 30 to 40 gauges in size inclusive—this insures the coils being wound with the same number of turns and a uniform ohmic resistance. The insulation of "NORTH'S" magnet wire is entirely of Italian Tram silk and applied in threads to the maximum number of turns per inch—the insulation will not break when the wire is wound on sharp corners, as in armatures.

Cheap magnet wire is made by using a greater number of threads at one time, forming a ribbon which is wound about the wire at a long angle to cover it with the fewest number of turns—this insulation will open when wound on an angle. "NORTH'S" magnet wire is wound with a single filament of silk, separately, on the same principle as wrapping a cracked baseball bat with cord.

For uniform insulation it is necessary that the number of threads or filaments of silk be perfectly adjusted to the size of the wire—that is, they must measure a given number of yards to their weight. A yardage test is made on all silk insulation before it is used.

"NORTH'S" magnet wire is in one piece per spool and the coils are wound with a minimum of splices. Silk is used as an insulation instead of cotton; for the insulating qualities are superior and being finer it permits of more wire being wound in a given space.

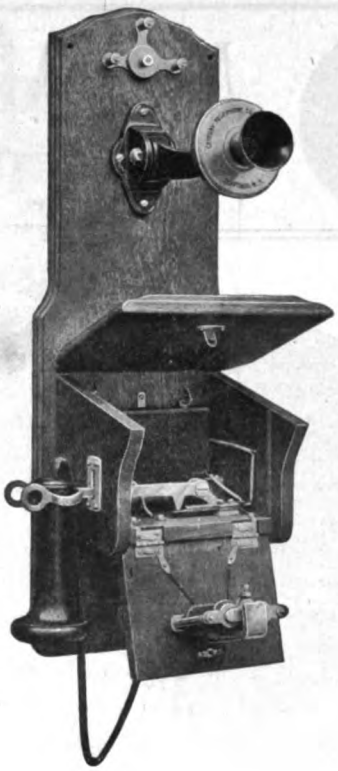
CENTURY
100% GOOD

IN COMMON BATTERY TELEPHONE SERVICE



it is absolutely necessary that the telephones are perfect, electrically and mechanically.

We manufacture wall and desk telephones for this class of service. During the past five years these telephones have proven to be the most efficient and reliable made.

Our No. 70 wall telephone is so constructed that all parts are easily accessible.

The cabinet, made of quartered oak, is small and well proportioned.

The telephone is equipped with our No. 5 Platinum Electrode Transmitter and No. 11 Perfection Receiver.

A trial of this instrument will convince you of its efficiency and reliability, and if interested we will be pleased to send you one or two of these instruments on 60 days' trial, charges prepaid.

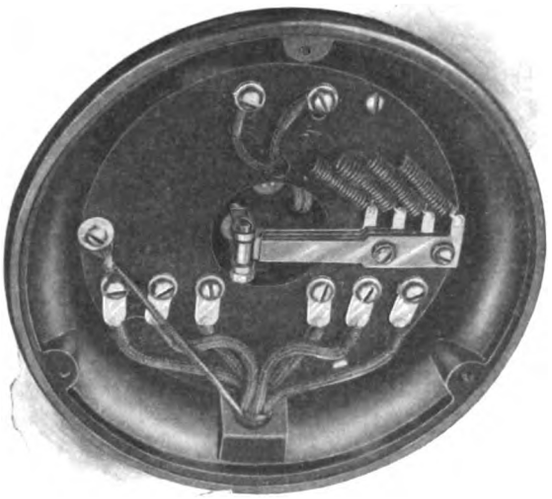
MONARCH APPARATUS
THE DESK SET



All wiring of a Monarch Desk Stand terminates in the base. The transmitter connections are metallic, and are brought down in two conductor silk cord. The hook switch springs being mounted upon the base, no other wiring passes through the pedestal tube. The connecting plate is made of hard rubber. All connections are plainly marked. Clips are provided for the receiver and connecting cords. All connecting plates are interchangeable. Local battery desk sets can be made to common battery by changing the connecting plates and transmitters. All Monarch Telephone Apparatus is described in the new catalogue. A copy will be sent upon request.

SIDE BRACKET. TYPE A

Patented

Cable Box.

CABLE TERMINAL EFFICIENCY.

A great deal of the efficiency of a cable plant depends upon the terminal and distribution facilities. And what is more, the type of terminal is of the greatest importance. Some of the points to be considered in its selection are protection, "getatability," compactness, rigidity. Considering these features collectively or individually you cannot find a terminal on the market that is superior to the HALL. Protection was given the greatest attention in its design so that when you buy a

HALL CABLE TERMINAL

you have bought protection against lightning, sneak currents, or crosses with dangerous circuits. The "getatability" of the Hall is unique. When the cover is taken off the top, bottom, front and back are exposed. No opportunity here for faulty inspection.

Compactness? Just look at the illustration. That tells its own story.

Rigidity? An all-metal framework carries the terminal plate. We couldn't make it stronger if we tried.

Seems to us you ought to get prices. Your name and address will bring them, and some more facts that will be of value to you.

DEAN TELEPHONE APPARATUS

COMMON BATTERY APPARATUS

Examine your "junk pile" and see if it is not the depreciation of the wood case of your telephones that has made them unfit for use. You will then be open for conviction. Our stamped steel case instruments with baked enamel finish that is practically indestructible, are proof against this depreciation—*They will stand up indefinitely.* If the enamel gets dirty, wipe it off and you have a finish as good as new.

We show our common battery steel box telephone in the above illustration. It has full sized, full efficiency apparatus, yet is extremely compact. The circuit is our Wheatstone bridge type, the simplest and best to be had.

They are adapted for all kinds of exchange work—residences, hotels, or business houses.

Prices are very reasonable.

Are You Satisfied

with the manner in which your telephone system is operating?

Do your subscribers become displeased and out of patience with your line and the management of it because of the "listening in" of others?

Must their messages be delayed because of the carelessness of others in leaving their receivers off the hook "cutting out" the rest of the line?

Now Mr. Manager-of-the-telephone-company it's clearly up to you to eliminate these faults and (incidentally) improve the efficiency of your line 100 per cent. by installing condensers of approved design and recognized merit.

Such condensers are the product of our factory and are called

ANDRAE CONDENSERS

They are well known for their effectiveness and durability, but if you are in any way undecided as to their value we will equip an entire line on trial and pay return charges if unsatisfactory.

We manufacture three distinct telephone condensers and consider them the best.

They are the "Standard," Type XX, which is made to withstand 300 volts, alternating current, indefinitely and comes in various capacities from 1-4 M.F. to 3 M.F.

The "Special" No. 225, actual size 2 11-16 x 1 1-2 inches, terminals included, is easily installed in any bridging magneto box and recommended for use on 'phones already in operation.

Telephone Condenser No. 186 is our new form of condenser fitted in a handsome, quarter-sawed oak case. Easy to install because of its simple, compact form.

Andrae Telephones Never Disappoint

We manufacture telephones and telephone accessories. None better.

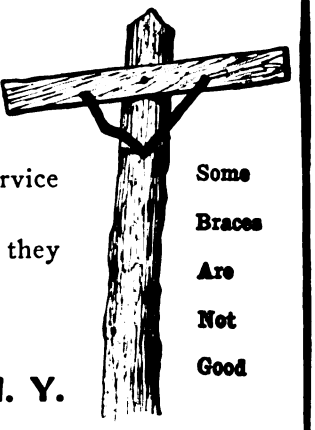
PLAIN AND GALVANIZED CROSS ARM BRACES



To protect yourself against damage suits and interference with service why not order our **Cross Arm Braces** and be sure they are right.

Our Braces are made from stiff **Bessemer Steel.** Consequently they are stronger than any other.

Let us quote you.

BUFFALO STEEL COMPANY, Tonawanda, N. Y.

AIBMVLOC

There is something wrong with that word. It isn't put together right. If you spell it backwards it will form the word "Columbia," the name of our telephones. It's just the same way with many of the telephones on the market. They have all the parts, but they are not put together right.

That's where they differ from ours.

When you buy a "Columbia" you get an instrument that is right all the way through.

You don't get a piano finish on the outside and a scrap heap on the inside.

Every part is built for efficient service under all conditions and it stays that way.

We'd like to have you write us for prices, we are sure you will never regret so doing.

We will buy your old telephones and switchboards.

To Confirm Our Claim "Low Cost of Maintenance"

¶ It is always interesting to know what the user has to say about the cost of maintenance. This letter is characteristic of what the users of our Generator Call Visual Signal Switchboards have to say about this subject.

EASTERN ILLINOIS INDEPENDENT TELEPHONE COMPANY.

KANKAKEE, ILL., 9-19-05.

Stromberg-Carlson Telephone Mfg. Co., Rochester, N. Y.

Gentlemen:—In reply to yours of the 18th inst. will say we have two of your Generator Call Visual Boards in operation. One has been in use for two years and the other for one year. We are very much pleased with them. The maintenance is simply nothing. Yours truly,

A. J. VERNIER, Mgr.

¶ Next week we will tell you what the user of this type of equipment has to say in support of all our claims.

¶ If you have decided to put in Generator Call equipment, it should be an easy matter to decide what type you will use, because the board we have been telling you about *pays for itself* in a short time.

¶ Let us name you a price on a complete new exchange.

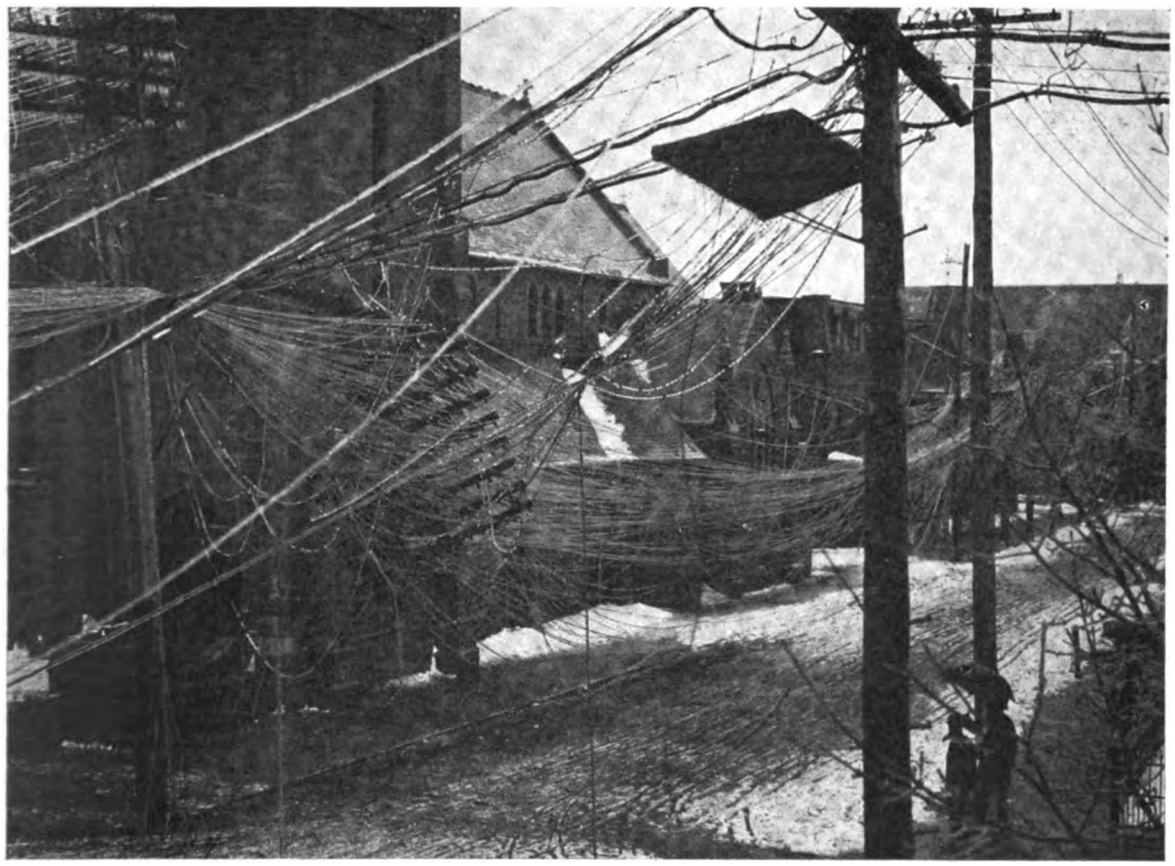
WE MAKE CABLE

No. 1--PHYSICAL DAMAGE.

Examine this picture carefully It shows two telephone leads—one cable, the other open wire.

A heavy sleet storm raged during the night and in the morning over 100 circuits were out of business. These were the open wires.

The actual physical damage is self-evident, but the feature of greatest importance is that the cables remained intact, notwithstanding the fact that they were called upon to support the weight of the tangled mass of wires, cross-arms, and tops of poles heavily coated with ice.



To repair damage such as this would cost in the neighborhood of from two to four thousand dollars, and if the lines were replaced in the original way, the same damage might be repeated with the next storm.

Open wire construction is most hazardous. Its only advantage over cable is first cost and even this will be so small if the work is done right as to be not worth consideration.

Have you any open wire lines? If so, this picture should be a sermon to you. Don't wait for the inevitable to happen, but forestall it. You can by substituting **STROMBERG-CARLSON CABLE.**

If it's cable it must be Stromberg-Carlson to be right.

No. 2--MORAL DAMAGE WILL RUN NEXT WEEK.

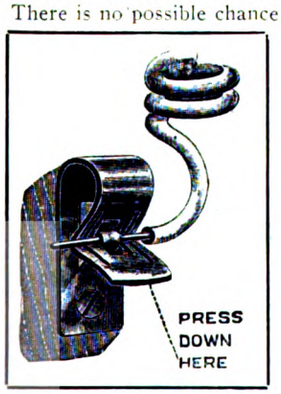
DID YOU EVER?

notice that on the regular style of dry battery binding post the wires are clamped between two hard unyielding surfaces? There is no possible chance for the air to circulate around the points of contact and dry out any moisture that would tend to corrode the surfaces. If you have ever seen a



Fahnestock Spring Binding Post

you must have noticed that the contacts are made in such a way that the air can circulate all around them. Another point. In making dry batteries the post for the zinc cup is usually soldered on before the battery is filled. It is thus subjected to all the corroding action of the chemicals as well as the dirt of the factory while the battery is being made. This is not the case with Fahnestock spring binding posts. These are put on the very last thing. They are bright when they leave us. They are bright when they are put on the battery and they are bright when you get them. This insures a good clean contact surface and the spring action insures a steady pressure on the wire.

See that you get this connector on your next lot of batteries. No matter what make of battery you are using the cost to you will be no more.

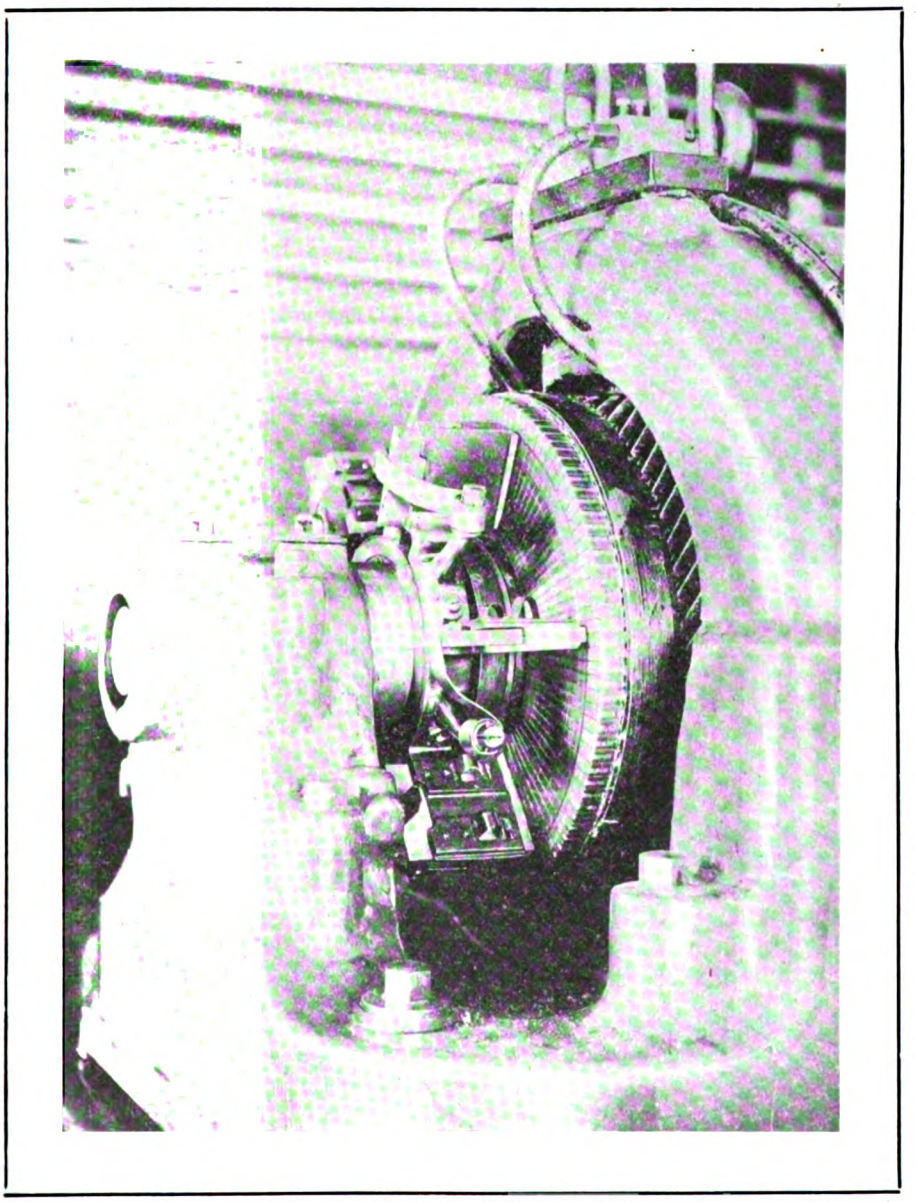
Power Installation*

By Arnold F. Pierce.

ALTHOUGH the larger part of the power consumed in the operation of a telephone exchange is that furnished in the form of a direct current for talking and the operation of relays and line and supervisory lamp signals in connection with the regular course of handling calls, the furnishing of alternating current for ringing calls for separate and special apparatus.

While hand-generators and "pole-changers" will serve every purpose of a small exchange, it is obvious that their sphere of usefulness is limited. The demands for ringing current of a large exchange are usually too constant and too heavy for the latter, and the former is out of the question entirely. The problem may be partially solved by the use of a large magneto-generator, driven by water or electric power, but in the large, modern exchange, the ringing machines serve other purposes than the one indicated by their name, and telephone engineers devised apparatus which would fulfil all their requirements.

In Fig 7 of this article there are shown the various circuits pertaining to a modern ringing machine. To the left of the diagram a motor-generator is shown, characterized as "Machine No. 1." It is a shunt-wound, bi-polar machine, working off the central office storage battery at twenty-four volts, and using from three to six amperes at full load. Its motor circuit is readily traced from the negative battery tap, through the retardation coil "RTC," the fuse and switch "s," to the negative brush "b" at the commutator. From the other brush the circuit goes back through the switch to ground. Shunted across the brushes is the field winding, with the starting-box "SB" in circuit to throw on the current gradually. The retardation coil is designed to take up the commutator hum, which might be communicated to the central office battery.



End View of Generator for Charging Batteries in Telephone Exchange. The Large Number of Commutator Segments Is a Notable Feature.

On the armature "A" there are, in addition to the motor windings, two or more windings for the generation of the alternating and pulsating currents of the generator side of the machine, the magnetic fields for these being of the same polarity as those of the motor fields. These circuits are brought out at the other side of the armature from the motor commutator, and those of the alternating current led to two rings and the pulsating currents delivered to a commutator "c." From the collector rings the alternating current is taken up by brushes and led to the "throw-over" switch "S," and the same is done with the positive and negative pulsating current. One of the brushes of the alternating collectors is grounded.

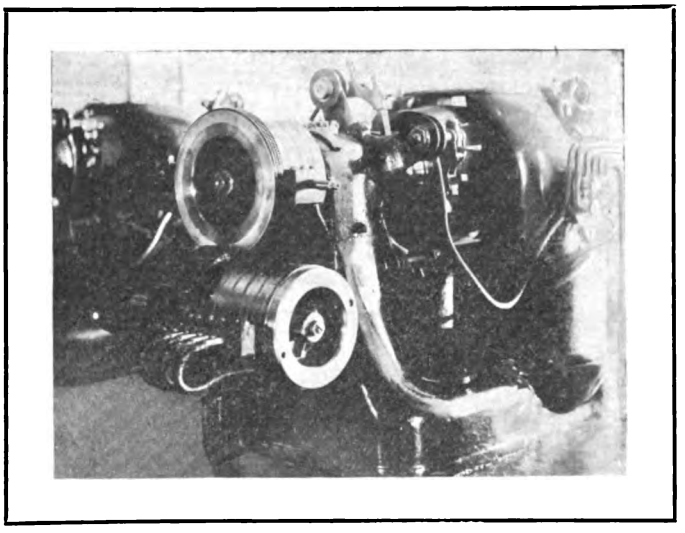
The "throw-over" switch is made up of two four-pole, double-throw jack-knife switches, arranged one above the other on the power-board, on a separate panel from the dynamo apparatus, and the ringing machine switch and starting box are placed nearby on the same panel. As shown, the switch is designed to accommodate two machines, in order to avoid any danger of failure of the power, one of these being self-contained so far as motive power is concerned, and

Continued from the issue of January 13th.

Digitized by Google

the other belt-driven by an electric motor off the power and lighting circuit of the building. From the center of the switch—the pivot of the blades—the circuits are made up into a cable and led to the fuse panel for distribution to the switchboard, etc.

Were generation of current the sole function of these machines the description would end here, but there are other features



End View of Ringing Machine, Showing High and Low Speed Interrupter Commutators.

to consider. In a large exchange, with multiple boards, "A" and "B" operators, and trunks from local relay offices and long distance and toll connections to put up and supervise, the need arose for a system of automatic signals to relieve the operators of oral supervision. If a line called for is busy, or out of order, some way must be devised to inform all the operators interested in making the connection that the line is not available. Oral information is out of the question with "B" operators in the rush hours, so "tone tests" were devised. The idea takes advantage of the humming noise made in a telephone receiver by the passage of alternating, or interrupted direct current, and by varying the periodicities of length or pulsation of this humming noise, a code could be readily arranged to inform the operator whether the wire was busy on a local call, held for long distance or toll, or out of order. It is not the purpose of this article to go into the details of how the operator receives this busy, or trouble tone in her receiver, but to confine itself to the origin of the various tones.

From a designated fuse, negative battery is taken through a wire to the ringing machine, and by means of a brush delivered to collector rings R and R'. Adjoining the ring is a commutator made up of segments of determined length of surface. The extent of surface offered to the brush collecting interrupted battery from the commutators determines the character of the tone, i. e., the tone may be short intervals of silence with a relatively long interval of noise, or it may be two intervals of noise followed by a longer one; or a short, long, and short hum. This is of course optional, but the leading telephone companies have adopted certain spacings for the different tones, so there will be no cause for confusion on the part of the operators. In the diagram, the commutator marked "h" is set aside for the howler, and the interrupted current therefrom is taken to the wire-chief's desk, to be sent on its way to attract the attention of subscribers who prefer to leave telephone receivers off the hook.

The battery current delivered to ring R' takes a different course. Passing into the commutators to right and left it is interrupted by the segements in different spacings of noise and quiet, and led to repeating, or transformer coils tc and t'c', passing through the primary windings to ground. The primary windings of these coils are .385 ohms, a sufficient resistance to twenty-four volts to do away with any other resistance coils in the circuit, and creating a powerful field about the thick core made up of fine iron wires. About this primary winding is wound the secondary, consisting of a few turns of heavy wire, with a resistance of .09 of an ohm. Unlike the howler current, the tone taken off these coils has no relays to operate, and consequently may be so small as to really produce "nothing but noise."

From these secondaries the tones are taken to the main fuse

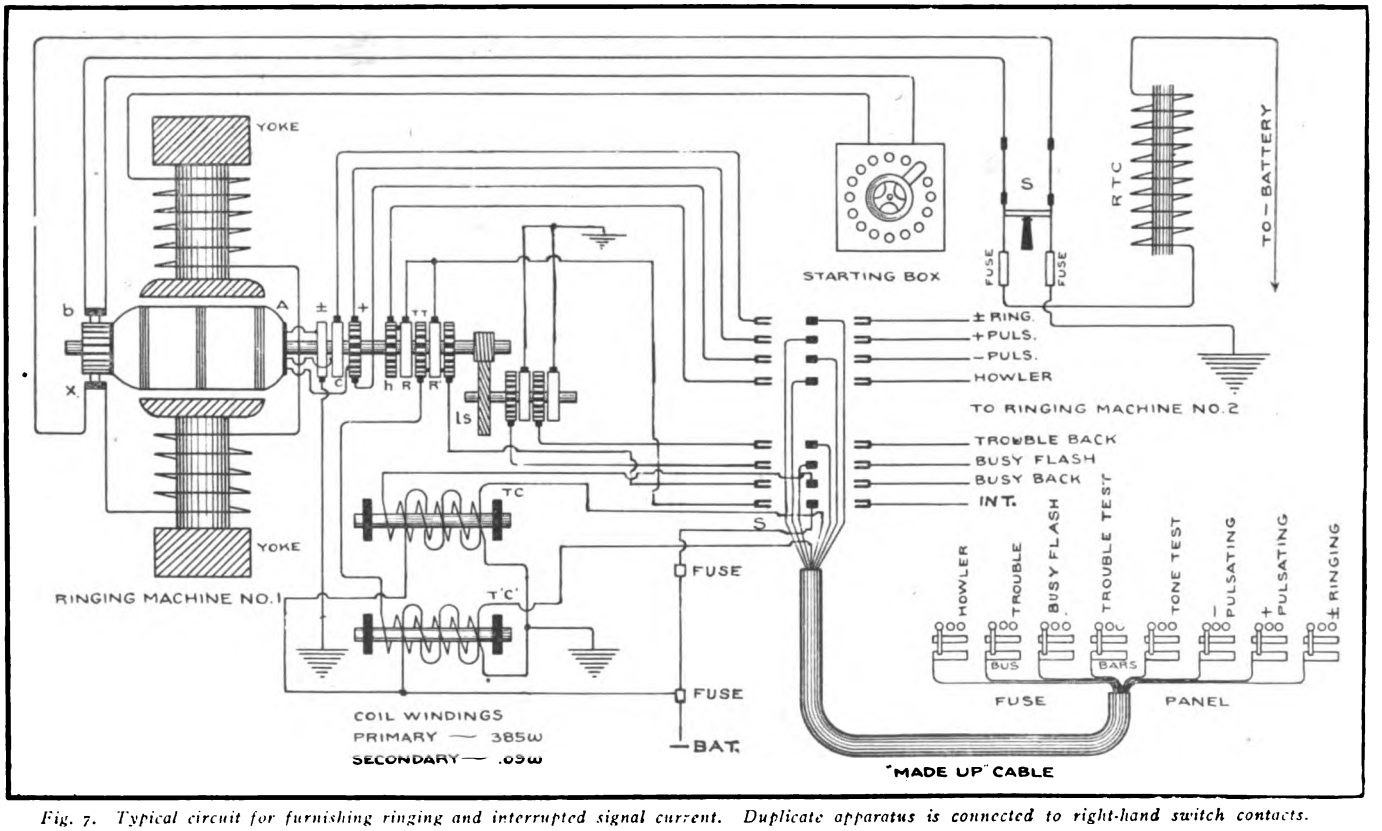


Fig. 7. Typical circuit for furnishing ringing and interrupted signal current. Duplicate apparatus is connected to right-hand switch contacts.

board, where they are designated in the diagram as "busy-back" and "tone-test," the latter being used for holding a line for toll, or long distance connection, and the former current being used to signal back from the trunk board to the calling operator at a toll switchboard when a line is busy. From the fuse board

Digitized by Google

these wires are taken to proper terminals on the switchboards.

Having given this consideration to the high-speed interrupted current, there remains the low-speed interruptor current used for operating flash signals, etc. These signals are used to operate supervisory signals from a trunk board. As an instance of their operation it may be supposed that an operator at one exchange receives a call for a subscriber connected to another board, by a trunk and order wire from the switchboard where the original signal is received. The operator receiving this call goes in on the order wire and notifies the operator at the distant exchange of the number desired. This operator assigns over the order wire to the operator originating the call a certain trunk number. At the same time she picks up the plug in which the trunk terminates at her exchange and tests the multiple jack connected to the line of the subscriber with whom connection is desired. In the meantime the operator at the first exchange has inserted her calling plug in the jack connected to the trunk line. If the "B" operator, on testing the subscriber's multiple jack, finds that his line is busy she, instead of making the connection, inserts the plug in a special "busy-back" jack. The interrupted current connected to this jack causes the alternate attraction and release of the armatures of relays which control the supervisory lamp in the calling side of the cord to which the original subscriber is connected. Flashes of this lamp, occurring at the intervals determined by the construction of the commutator on the ringing machine, notify the operator that the desired line is busy. At the same time a characteristic noise is heard by the subscriber, and he usually understands the meaning of this noise and hangs up his receiver without being notified by the operator. A separate code is used to notify an operator that a line is in trouble. The method of furnishing interrupted current for this purpose is as follows:

Mounted on the armature shaft with the commutator described is a reduction worm-gearing, operating the shaft "ls." On this shaft are mounted two collector rings, and two commutators, delivering interrupted current to their respective brushes. With varying length of segment surface, these commutators give battery for the trouble-back, and flash signals, and as this current is to be used to operate relays, the circuit is non-inductive.

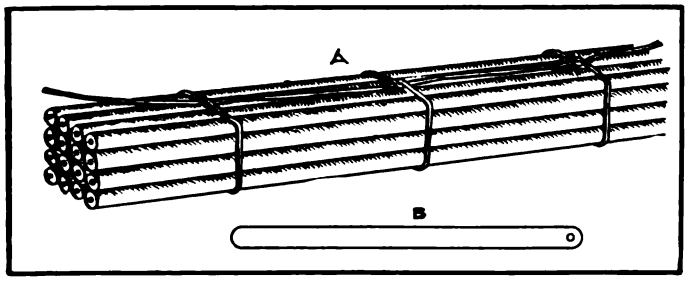

Fig. 8. Section of cable formed up and tied with so-called "Chicago" stitch.

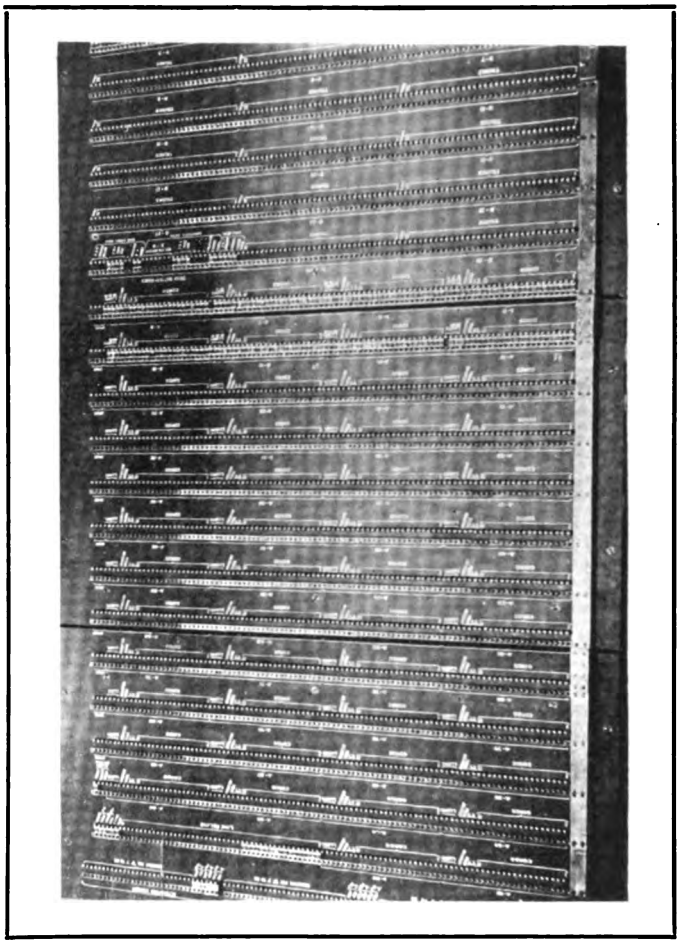
It is led through the switch as shown and delivered to the fuse panel through the cable.

The apparatus considered may be extended in its scope to take in other signal tones not spoken of in this article, and to provide for such additional equipment, there are in use in some exchanges other rings and commutators not shown on the diagram, but mounted on the high and low-speed shafts. Again, where harmonic bells are used for party-lines, the machine may generate the varying frequencies required for their operation, and the regular ringing current as well.

The idea of interrupted current and this method of interruption is said to have come from a device used by a physician for electro-therapeutic work. The idea was elaborated upon by telephone engineers, and, as shown, by means of transformers and segmentation the various tones and signals were easily obtained.

The ringing machines of a central office are usually placed upon a small table near the power switchboard. This table has framework constructed of angle irons, and a slate top. The top is drilled to accommodate bolts for fastening the machines, and to provide holes for the passage of wires.

When not in use the machines are kept covered with tarpaulin, or regular canvas machine covers. The various circuits from the power board are conveyed to the machine table in conduit, and where they appear for attachment to the brushes, terminals, etc., they are made up in a cable form. This cable formation is



Fuse Board, Not Arranged for Use of Special Alarm Fuses.

also used where the wires distribute to the "throw-over" switch, and where they come up the rear of the fuse panel to the fuse mountings. Fig. 8 shows a cable so made up of sixteen wires, "A" being a perspective view, showing a cross section. A waxed cord is looped around the wires—which are shaped into the form desired—and the free end of the cord is sewed through the body of the form, cross-wise in each direction. With these stitches placed at intervals of four or five inches and the completed cable treated to a painting with shellac, the effect is very neat. It is understood that rubber-covered and braided single or paired wires are used for all such purposes. The stitch described is known as the "Chicago stitch." A convenient needle for sewing the form may be made of a broken hack-saw blade, as shown in "B." The blade is softened, the teeth removed with a rough file, and the eye hole cut away to make a hook for the cord. Another most satisfactory needle may be made from a four-inch length cut from a steel snake One end should be heated and a hole punched to receive the thread.

With a large central office, provision must be frequently made for supply private branch exchanges with battery current, and ringing current. For the battery service, a slate panel is arranged with vertical strips of fuse mountings and terminals, with a bus-bar on the central office side to supply battery through a fuse to the terminal of the battery wire from the outside. A fuse alarm device is frequently installed on this panel to notify the attendants of any trouble.

For ringing current a similar arrangement is used, except that the current is led through a lamp resistance before going out of the central office. In both cases the ground is used for a return from the private branch installation.

Economical Telephone Accounting and Filing Systems

ARTICLE III.—BRANCH EXCHANGE REPORTS.

*By Charles C. Wilmot, Telephone Accountant.

This article and all forms reproduced have been protected by individual copyrights.
Copyright, 1905, by The American Telephone Journal Company. All rights reserved.

THE illustrations accompanying this article show a number of forms for the making of returns on branch exchange business to the central office. Five distinct forms for this class of work have been designed. These are all of uniform size, 10¾ x 11¼, and are made in duplicate. One operation makes the general office report and the duplicate is the local exchange record. A good carbon sheet should be used and proper care exercised to have it in proper position to make a plain copy.

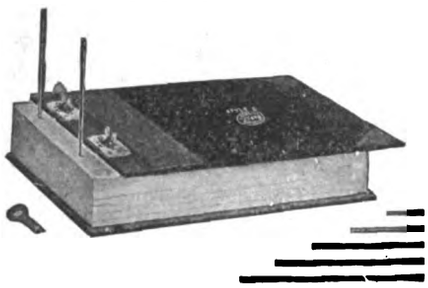

Fig. 1. Loose-leaf binder for branch exchange reports.

The original is perforated in order that it may be removed and mailed to the general office. A loose-leaf interchangeable post binder, Fig. 1, is designed to hold a number of these sheets, properly separated by tabbed sheets indexed by form numbers.

The method of filing the original reports at the general office will be taken up in detail in a later article on filing methods.

This method results in the saving of stationery, time of office force, uniformity in size of reports and the great advantage

After work for the current month has been posted and verified all carbon copies may be transferred from the original binder, Fig. 1, to a special binder holding as many sheets as can properly be inserted without making a book of unwieldy bulk. Index sheets of plain Manila paper should be used to separate the months and different forms of reports in this binder.

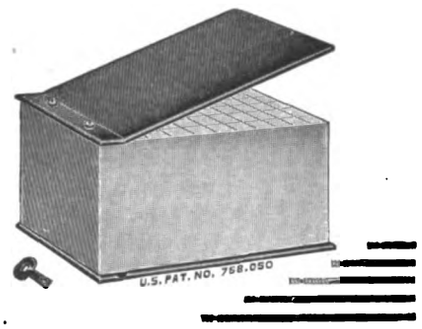

Fig. 2. Special binder for transferred sheets.

In Fig. 3 is shown a collection report sheet, form No. 75. These sheets, kept in duplicate, serve as the itemized cash book for branch exchanges and the "cash collections" report to the general office. The original is to be torn off at the perforated line and mailed in to the headquarters of the division, either monthly, weekly or daily, as the size of the exchange may render necessary. The making up of collections and cash receipts should be completed daily, by first arranging the coupons

Hard Drawn Copper Wire*

By T. B. Doolittle.

In recent years improvements have been made in the process of manufacture, which cover all operations from the ingot to the finished product. At the time recorded above it was the practice to roll a billet of copper, say of six or eight inches in width, into a long sheet and then, after being annealed, it was taken to a slitting machine and slit into square rods. These rods were tapered by means of a hammer, in order that they might be inserted far enough through the drawing die to be grappled on the opposite side, after which they were ready to be drawn into wire. This method of starting with a square rod had a distinct disadvantage for the reason that the corners were likely to lap and fold over in the process of drawing, thereby producing flaws or bad places in the wire, these flaws becoming more and more troublesome in the smaller sizes of wire. After having been drawn through a certain number of "holes," the surface of the wire becomes hardened to an extent which requires that it should be annealed before any further reduction in size is practicable. The new process is substantially as follows:

The copper is received from the smelting works in the form of wire bars, which are approximately fifty-four inches long, with an average diameter of about 3¼ inches, and weigh about 200 pounds each. These are delivered as commercial copper wire bars.

The first operation is to put the bars into what is termed a "continuous furnace," the bars going in at one end of the furnace and taken out at the other. In their passage through they are heated to about 950 degrees Centigrade, at the rate of about two bars per minute.

The heated bars are then put through a series of grooved rolls. Each succeeding groove being smaller, it results in a reduction of the 3¼-inch bar to a cylinder with a diameter of 5-16 inch. These are now called rods, and are taken up on a reel in the form of a coil about thirty inches in diameter. These coils are then taken from the hot-rolling department and are cold at that time. They are then plunged into a bath of sulphuric acid and water for the purpose of removing whatever oxide has been formed in the hot-rolling operation. After about twenty minutes in this solution the oxide is removed and the rods are then taken and thoroughly washed with clean water under a high pressure from a hose; after which they are immersed in a vat containing a lubricant of tallow and soap. The rods are now ready for the drawing process.

The rods are substantially drawn on what is termed by wire manufacturers a "continuous wire drawing machine." That is to say, the five-sixteenth inch rod goes in at one end of the machine, and, after passing through several dies, each one reducing the diameter and hardening the wire, it finally is drawn around a block to the finished size, say, .104".

In making this reduction, the copper is reduced in diameter from No. 1 wire gauge to No. 12 wire gauge, or, in technical terms, the wire is "eleven numbers hard." This process gives the wire the greatest amount of tensile strength possible from commercial copper and yet preserve its elasticity. The cost of production is enormously reduced by the new process. Whereas, under the old process, a very skilled workman was required for each single drawing, an attendant is now able to care for several continuous drawing machines that are run at a speed unapproachable by the old method. In the smaller sizes of wire, diamond dies are employed which, in themselves, represent a very considerable investment.

Commercial copper in its soft state has a tensile strength of about 28,000 pounds per square inch, with an elongation of about thirty-six per cent., and by the cold-drawing process above described, the tensile strength is increased by each number drawn, and the elongation is reduced; therefore, when the copper wire is drawn eleven numbers hard, it has a tensile strength of about 64,600 pounds per square inch, with an elongation of about one per cent. The wire is then taken from the wire-drawing blocks, so-called, and is carefully inspected for tensile strength, elongation, torsion and conductivity. The inspected wire is then carefully packed by wrapping each coil with burlaps, so that it does not become bruised or damaged in any way by transportation.

The cost of hard drawn copper wire fluctuates with the price of ingot copper, and at present writing is quoted at sixteen cents per pound. The relative cost of copper and iron wire, say of No. 12, is three and three-fourths cents for iron and sixteen cents for copper.

The advantage of copper over iron, besides what is shown in the table below, is that it is practically indestructible except from mechanical injury, and, if it receives mechanical injury, it can be made over into new wire at a cost of above two cents per pound, while iron, which is subject to rapid deterioration from rust, is worthless when taken down. The output of hard drawn copper wire has steadily increased from year to year.

The comparative properties of No. 12 N. B. S. gauge copper and iron wire are given in the following tables, this being the size in the largest general use as telephone toll line conductors.

No. 12 N. B. S.	Diameter in Mills	Resistance per Wire Mile 68° F. Ohms	Inductance per Pair Mile Millhenries	Effective Resistance per Wire Mile Ohms	Electro Static Capacity per Pair Mile Micro microfarods	Miles equal to 1 Mile Hard Drawn Copper for Telephone Transmission
Soft copper	104	5.1	3.66	5.1	8220	1.02
Hard drawn copper	104	5.2	3.66	5.2	8220	1.00
Iron B. B.....	104	36.0	18.00	47.0	8220	0.26

No. 12 N. B. S.	Diameter in Mills	Weight per Wire Mile, lbs.	Tensile Strength in Pounds.	Torsion in 6 inches	Elongation, per cent.
Soft copper.....	104	173	290	50-75	40.
Hard drawn copper.....	104	173	550	25-45	1.
Iron B. B.....	104	153	450	45	18.

The above figures represent average commercial conditions. The soft drawn copper wire is assumed to have a conductivity of 99 per cent. of that of pure soft copper, while that of the hard drawn is 97 per cent.

The wires of a pair are supposed to have a separation of 12 inches on centers. In calculating the inductance and effective resistances, a frequency speed (2π) of 5,000 has been taken, while assuming a permeability of 100 for the iron wire.

Much of added interest could be written were the writer to disregard the individual trade secrets that must be respected.

*Extract from article in the Harvard Engineering Magazine, continued from the issue of January 6th.

ASSOCIATION OF INDEPENDENT TELEPHONE MEN RECENTLY FORMED IN OREGON.

On January 4th there was organized in Portland a new State Association—the Oregon Independent Telephone Association. The charter membership of the new organization comprises a large number of the Independent telephone companies of the State, and the intention is to bring in all those not yet affiliated with it. They propose to work as a unit to improve the Independent service in Oregon and to fight for business against their competitor, the Pacific States Telephone Company, owner of the Bell lines.

For several years the Independent companies throughout the State have been struggling to gain an entrance into Portland and

Digitized by Google

have repeatedly applied for franchises in this city, which have been refused. The construction of the automatic system now being installed by the Home Telephone Company has settled the difficulty. This company will be the chief factor in the new organization and will give to the other Independents the Portland connection of which they are so desirous. The extensive system which will result will be in a good position to compete with the Bell lines for long distance as well as local business.

At the meeting yesterday afternoon, which was held in the Columbia building, the following men were present: F. H. Stow, manager of the Home Telephone Company; W. D. DeVarney, who is manager of the Corvallis Telephone Company; S. G. Hughes, the manager of the Forest Grove Telephone Company; O. G. Wilkes, manager of the Hillsboro Telephone Company; J. W. Condon, manager of The Dalles Telephone Company; P. L. Brown, manager of the Silverton Telephone Company; Henry C. Chappelle, manager of the Woodburn Telephone Company; Manager A. B. Flint of the Scholls Telephone Company, and C. H. Morris, manager of the Dallas Telephone Company. There are also Independent systems at McMinnville, Albany, Brownsville, Lebanon, Scio, Stayton, Turner, Chemawa, Newberg, Dayton and Sheridan. All of these companies will be asked to join the association. In addition to these the Home Telephone Company has been granted a franchise in Eugene, Baker City and Pendleton, and these cities will also be connected with the Independent system as soon as the lines are installed.

The meeting was called at the instigation of W. D. DeVaney, of Corvallis. A constitution was drawn up and adopted, and the following officers were elected: F. H. Stow, president; S. G. Hughes, vice-president; P. L. Brown, secretary and treasurer. The executive board is composed of F. H. Stow, P. L. Brown, J. W. Condon, C. H. Morris and O. G. Wilkes. The constitution is modeled after that of the Indiana Independent Telephone Association.

The men present at the meeting represented companies owning 3,888 telephones actually in use. They are distributed among the various cities thus: Corvallis, 1,500; The Dalles, 500; Alsea, 450; Forest Grove, 430; Dallas, 258; Tillamook, 225; Hillsboro, 165; Scholls, 140; Silverton, 105; Woodburn, 95, and Beaverton, 20. It is estimated that there are about 14,000 Independent telephones in the Willamette Valley alone.

OFFICIAL BULLETIN NUMBER SEVEN OF THE NATIONAL-INTERSTATE TELEPHONE ASSOCIATION.

MAPS:

Toll line maps have been begun for Wisconsin, Iowa and South Dakota, making nine States for which maps are at present being prepared. Others will be commenced during the next month. Have you sent us that map of your lines?

"LOOK FOR THE SHIELD."

This Independent slogan suggested in Bulletin Number Five is taking with Independent companies. We recommend its general adoption in advertisements. It is catchy and to the point.

THE SUPPLY DEPARTMENT

Is still furnishing standard toll signs and printed matter bearing the "Official Shield." Are you taking advantage of it, and helping to make it a success? Illustrated catalog sent on request. Have you seen the gold plated "Official Shield" emblems? Samples 35c. each.

COMMITTEES:

A great deal of care is being taken in the selection of Committees decided upon at the last meeting of the Executive Council. The make up of these Committees will be announced later.

NEW ORGANIZATIONS:

The Oregon Independent Telephone Association was formed at Portland on January 4th.

FARMERS' LINES AS PARTNERSHIPS.

A SUIT has just been ended in the Circuit Court of Washington county, Ind., which is of considerable importance to farmers' lines throughout the country. G. W. Fritchley, Dr. Weber and B. R. Tally, of Parkersburg, had enjoined J. M. Gallagher and N. W. Byrne from removing the switch or disturbing the use of the line built from West Salem to Parkersburg in 1903, which it was claimed was part of the old Edwards' Mutual Telephone Company. Gallagher and Byrne claimed the right of control over this line and the switchboard and all other property of the old company as directors of a new corporation formed in June, 1903, under the same name and composed of considerable less than half of the old subscribers to the Edwards company, before incorporation. The Court made the injunction permanent against Gallagher and Byrne and in deciding the case held that all the subscribers to the various lines comprising the old company held either a partnership interest in the lines, or a joint interest in the lines built by the subscribers to each line. It decided that in either event the corporation, when organized, had no interest in these lines and only obtained an interest when a subscriber assigned his stock in the old company to the corporation and then the owners of interests in the old company who had not joined the corporation, were partners or joint owners with the corporation in the interests or property of the old company, and the corporation had no more right to control the old company's property than the subscribers who had not joined the corporation had to do so. Incidentally, a serious question was raised about the legality of the corporation, the complainants showing that the stock to it had been subscribed before authority to open the stock books had been received by the officials.

ILLINOIS COMPANIES CO-OPERATE IN EXTENSIVE FREE TOLL EXCHANGE.

SUBSCRIBERS to the system of the Williamsfield and Center Prairie Farmers' Telephone Company, at Williamsfield, Ill., are able to secure through traffic arrangements with many of the Independent systems in Knox, Peoria, Stark, Henry, Fulton and Mercer Counties free connections with over 20,000 subscribers. A new metallic toll line is being built to Galesburg which will be of great benefit to the farmers and merchants in the neighboring country. New construction will be taken up in the spring and a number of extensions will be built. Especial attention is being devoted to the development of rural business, and this, with the extension of trunking facilities will be an important step in the knitting together of the business interests of the whole territory served by this system of lines. The benefits of active co-operation between companies occupying adjacent territories are illustrated not only in the highly satisfactory service offered in this district, but in the gratifying growth of the company.

THE EDITOR'S PAGE

CONSISTENT DEVELOPMENT.

TO all readers of current magazine articles the name of James J. Hill is known. Its mention brings to mind stories of his marvelous skill as a creative railroad man. His work is known as that of one who, trained and experienced in the building and operation of railroads, has from small beginnings built a system of transportation lines which is gigantic in size, and which is made to pay. His system is considered marvelous and the results achieved are truly wonderful. Yet, his methods contain nothing of the mysterious; in fact, the basic principles upon which he has founded a successful career are so simple that they may be instantly grasped by the poorest understanding. After mastering the details which enabled him to carry on the work of operating a road at a profit, his mind was opened to the possibilities of his future. With the knowledge of how to make a profit from the carrying of every ton of freight, the increase of profits was seen to depend primarily upon the increase of tonnage. Then he had reached the point where he must study methods of raising the bulk of his freight.

At this time he was provided with the foundation of a system. He had a right of way and equipment which served as a base. For the further improvement of the system there were open two lines for logical development. One of these was to increase beyond the limits of home consumption the production in regions already tapped by his lines. The other consisted in reaching centers of production of articles which would naturally follow his roads. As a corollary of the latter proposition appeared the necessity of developing these secondary centers of activity. These two separate and important problems he solved, and in so doing gave a demonstration which may well be taken as a lesson by telephone men.

Telephone lines carry messages instead of freight; but, in so far as railroad companies carry frieght to make a profit, it is clear that, if each telephone message above a certain number brings in a sum in excess of the cost to transmit it, the parallel between the two classes of business is clear. In the telephone industry the thing of prime importance is the development of the local territory. The number of people who use the telephone must be increased. After this has been accomplished there must come the extension of the distance over which each of these users will transmit messages. In considering this phase of the business one must take under advisement the existing facilities, and the possible construction of new lines.

The location of these lines is the all important factor of success. It should provide for the fulfillment of every possible business requirement which is so insistent as to demand connections taking place with such frequency as to be profitable, or which may be increased to a profitable basis of operation. It should not only provide for taking care of this business, but for the handling of it in the most efficient manner. A short line will pay better than one that does the same amount of business over a longer and more circuitous route. A line directly connecting two important centres of trade carries more traffic, even without competition, than a route requiring many switching operations. If it is easier to telephone than to dictate a letter, a man will frequently use the wire for an affair where two days' delay would not cause him inconvenience. It is, therefore, an important factor to make the telephone the greatest time saver.

The development of such routes cannot be undertaken at random. Definite results are secured only from a knowledge of exact data. Such data for Independent telephone systems are now being prepared. The maps of the National-Interstate Association will afford the firmest foundation for the profitable growth of the Independent telephone business. Each system represented reaps advantages from a two-fold source. While an individual is seeking means of reaching his neighbors, near and remote, others are looking for the shortest and easiest method of establishing connections with him. He increases his outgoing business, and his incoming tolls are doubled through the efforts of outsiders.

It is important then that each should send in data for these maps; more than this they should be forwarded at once. Every manager should tell his associates what he has to offer. He will then find himself enjoying the ideal condition obtained when business seeks the man. On the other hand, with data concerning other companies before him he will be prepared to push his business in new directions; and, from a knowledge of where to point his growth, he may shape his efforts in a manner to produce the most successful results. Every day's delay means a loss of profits, a loss which is felt by all, and by each individual alike. From the time a man sends in a plan and description of his lines he may begin to watch his business increase; each one who sees the result of the combined efforts of his associates may begin at that instant to push his work into new fields, and from the day when this takes place will date a new period of prosperity to the operator and of satisfaction to the subscribers.

A PASSING IMPRESSION.

ONE of the unique and important features of the Chicago Electrical Show is the attention which is being paid to various bodies of students of electricity and engineering. The visiting of the exhibition by large numbers of young men from various colleges and universities located within moderate distances of Chicago, will enable them to acquire a knowledge of the equipment used in various branches of electrical industries which could be obtained in no other way. Opportunities for the actual observation of practice covering the same field from many points of view rarely come to the student. It is likely that the facilities for comparison of the various features of the show will be eagerly seized by these young men, alert for new ideas and eager to put themselves in touch with the work being done by those with whom they hope soon to associate themselves. The anxiety for knowledge, and the spirit of investigation which these men will bring into evidence by their movements is likely to make them peculiarly impressionable at the time of what will, for many, be their first visit to a modern industrial exposition.

The frame of mind in which they approach the exhibition will make the reception of one of its foremost lessons almost certain. Probably the most notable feature of this show, as compared with those which have come before, is the importance and prominence of the telephone interests. These will be represented in a manner which can leave no doubt of the high place which telephonic affairs have attained in the electrical field. The idea will be strengthened not only by the predominance of this class of exhibitions, but by the high grade of engineering and mechanical skill embodied in the construction of apparatus. The establishment in many minds of a desire to join in the development of a work which can make such a strong and favorable showing is inevitable. It is probable that this attraction of men who are being trained for important positions in the future will not be the least important benefit derived from the exposition at Chicago.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

EXCLUSIVENESS NOT IMPLIED IN FRANCHISE.

In our proposed franchise the language occurs that "the city shall be entirely free to grant a franchise to another company at any time it may see fit." It is also provided that the company shall pay the city 3 per cent. of its net earnings each year. Does this not imply that the city shall not during any year it receives its 3 per cent. grant a franchise to any other company? Would it not be wrong for it to receive the percentage and then grant a franchise to another company? R. C.

THERE is no exclusive feature implied in the franchise you mention, because to assume any such tacit provision would be to construe the contract entirely at variance with the explicit provision that gives the city the right to grant a franchise to any other company at any time it sees fit. Courts never negative a specific unequivocal express provision of a contract by implying a contradictory tacit one, and they would particularly not adopt such a construction when the express provision is legal and the one sought to be implied may not be legal. Courts never favor exclusive franchises, but always bend their decisions toward free competition in trade and commerce. We do not see how it would be wrong for the city to receive a percentage and grant a franchise to another company. The percentage would be paid in return for a valuable consideration, which, in this case, is the franchise, whether exclusive or not exclusive.

RES IPSA LOQUITUR.

In your issue of January 6 you use the phrase res ipsa loquitur and say it was applied in certain cases that you cite. Will you kindly explain the meaning of the Latin phrase? L. E.

A LITERAL translation of this phrase is "The thing speaks itself." The doctrine that it designates is applied particularly in personal damage suits to a state of facts that shows the defendant to have been negligent without any further explanation of that which constitutes the negligence. For example, if the fact is that a telephone wire is down in such a way that damage results and the company must have been negligent or the wire would not have been down, it is said, "res ipsa loquitur" or "the thing speaks itself," and it is not necessary to show the details of the company's negligent conduct. It is not the editor's intention to use phrases that need explanation in this page, and he did so in this case merely for the sake of brevity.

RATE CONTRACT WHERE CITY GRANTS FRANCHISE IN RETURN THEREFOR.

THE case of Wright v. Glen Telephone Company, recently decided by the Supreme Court of New York, contains a point of general interest with regard to telephone service where a franchise has been granted to a company, based upon a reasonable consideration to serve citizens of the town granting the franchise. A citizen brought the suit, alleging that the cities of Gloversville and Johnstown were in 1900 receiving telephone service from the Hudson River Telephone Company, and that the Glen Telephone Company presented to the city council of Gloversville a petition embodying its proposed terms of service, and asking that the franchise be granted. The petition was signed at the request of the company by the plaintiff and many other citizens. The council adopted the franchise by which the company had the right to erect its line in the streets, and in consideration thereof, among other things, was to furnish the citizens' office service at $2 per month and residence service at $1 per month, the patron to furnish his own telephone. The plaintiff made a contract with the company according to the terms of the franchise, discontinuing his service with the rival company. By reason of the petition, the Hudson River Company discontinued its telephone service, got control of the defendant company and manages that company. The defendant then refused to serve the plaintiff unless he would sign a contract agreeing to pay $3.50 per month and use its telephone, refusing to continue his service under the former contract.

In deciding the case for the plaintiff upon demurrer, the court held that it was true, as the company contended, that it gets its right to pass over the streets and highways, not from the city, but by virtue of the transportation law, but this so-called franchise from the city gives the company valuable rights not secured to it by the transportation law, since that law gives the company no rights in the public parks or upon the public property or public places of the city outside of the highways. Neither does that law deprive the city of its police power under which it may determine how the lines are to run, whether upon poles or in subways or conduits. The court therefore held that there was sufficient consideration between the defendant and the city, and that the contract was binding between them.

The company further raises the point that the plaintiff was not a party to the contract between the city and the telephone company, and that the city owed to its citizens no duty of obtaining for them cheap telephone rates, and therefore the plaintiff could not maintain his action. The court overruled this contention, holding that the public places of a city are for the pleasure of its citizens, and when a city grants a telephone company the right to erect its poles in these places, interfering more or less with their use by the citizens, it is its duty to require that they shall receive services at reasonable rates. The court also held that the plaintiff, by signing the petition to the common council asking that the franchise might be granted, became a party to the contract and its consideration, and it was made for his benefit as well as for the benefit of the company and the city itself.

The court therefore held the contract between the defendant and the city and that plaintiff might insist that the defendant comply with its conditions so far as he was concerned. Wright v. Glen Telephone Company, 95 N. Y. Supplement 101.

SUES FOR DAMAGES CAUSED BY WRECKING COMPANY.

ALLEGING that the Commercial Telephone Company was wrecked and his 442 shares of stock thereby depreciated until they lost all their face value, H. M. Aubrey has entered suit at San Antonio, Tex., in the Thirty-seventh District Court against F. C. Smith and E. A. Glass, the president and secretary respectively of that company. He asks for damages in the sum of $42,200, which he alleges was the face value of the stock.

Mr. Aubrey sets out that the company was organized to operate a long-distance telephone line in the State and that in May, 1903, the defendant Smith obtained control of the majority of the stock of the corporation and caused the election of a directorate, composed of W. H. Scott, E. A. Glass, William Mann and V. I. Holcomb. He says he knows the residence of none of these directors, save Mann and Glass. The plaintiff alleges that Scott, Mann and Holcomb were not bona fide stockholders in the corporation, and that they caused improper transfers of property.

IN THE OPERATING FIELD

FOURTH DISTRICT OF THE INDIANA INDEPENDENT TELEPHONE ASSOCIATION HOLDS MEETING.

A SPECIAL meeting of the Fourth District branch of the Indiana Independent Telephone Association was held in Lafayette on the 5th inst., Vice-President O. B. Farberg presiding, and Frank Goodwine acting as secretary. Twenty-six Independent telephone companies of the Fourth District were represented. The principal question discussed was the advisability of certain Independent companies operating in the western counties of the State to enter into a sub-license arrangement with the Bell company with headquarters in Danville, Ill., for long-distance service. The proposition was disapproved and a committee appointed to go to Danville, Ill., and arrange for Independent long-distance service, so as to accommodate the companies. It was made plain that no Independent company could join hands with the Bell company and retain its standing with the Indiana Independent Association. William Vesey, of the New Long Distance Company, of Indianapolis, addressed the meeting on the latest phases of the Independent telephone situation in the State. Mr. Vesey said the cause was never stronger nor the companies in better condition than at present. The meeting was well attended and the interest manifested showed the Independent companies of the Fourth District to be in a prosperous condition.

CUMBERLAND OPERATING WITHOUT A FRANCHISE IN PRINCETON, INDIANA.

THERE is every prospect of a telephone war in Princeton, Ind., where it has developed that the Cumberland Telephone Company has been operating for a year or more without a franchise. Since the decision of the Federal Court declaring the company a trespasser in Evansville, the city attorney of Princeton has made an investigation which warranted him in holding that the company is likewise without legal rights in Princeton. The company claims to be operating under a perpetual franchise which was granted to the old American Bell Company, several years ago, and assigned to the Cumberland people. City Attorney Brady said the court refused to uphold this proposition and has advised the city to take steps to oust the Cumberland, or compel it to seek and accept of a franchise dictated by the city. There will be strenuous times in Southern Indiana over the telephone franchise question for the next few weeks.

IMPORTANT IMPROVEMENTS TO BE MADE BY INDEPENDENT COMPANY IN IDAHO.

THE Independent Long Distance Telephone Company contemplates making improvements which will involve an expenditure of from $60,000 to $80,000 upon its plant in Boise. The new exchange and office building, now well under way, will cost upwards of $15,000, and will be a model structure for the purpose for which it is intended.

The building will be three stories in height, with a large basement. The basement will be used principally for the storage of supplies. The first floor will be divided into apartments consisting of the long distance general office of the local manager and work shop in the rear. The second floor will accommodate handsome offices for the superintendent of the company, the general manager, apartments for power plants, storage batteries, wire chief's desk and distributing frames. The third floor will be given over entirely to the use of the operating department and will be divided into reception rooms, retiring rooms, cloak and wrap room, and a spacious dining room, which will be fitted with a gas range and cooking paraphernalia, dishes and cupboard.

The new switchboard to be installed, which will cost over $20,000, will be one of latest pattern, operated by a 40-volt battery and equipped for a four-party selective ringing system. It is to have a capacity of 6,000 lines. A new switchboard and other facilities for rural lines will also be installed.

The Independent Long Distance Telephone Company is reported to have enjoyed a very prosperous year, the volume of its local business during 1905 having increased fully 50 per cent. The improved plant will afford a basis for further development which should result in greatly increasing the value of the company's service.

NO MORE FREE TELEPHONES TO CITY GOVERNMENT IN TOLEDO.

BRAND WHITLOCK, the new mayor of Toledo, who is a prototype of the deceased Mayor "Golden Rule" Samuel M. Jones, has been doing things out of the ordinary since he took his seat New Year's Day. Not only have free passes from electric and steam railroads been refused by the new mayor, not even permitting any of the city employes to use them, but he has taken a stand as to the city being furnished free telephone service. Under existing franchises, the city offices have free telephone service. Telephones were furnished to the residences of former Mayor Robert Finch, as well as other former mayors, but Mayor Whitlock will not listen to any such thing. He argues that a mayor is not entitled to free telephone service any more than any other citizen. The new mayor will pay for his residence telephones, and will furthermore make the city pay for all telephone service furnished by the Bell and Home companies. Mayor Whitlock will execute his purpose upon the basis of a recent decision made by the supreme court several months ago, in which it was decided that no city has a right to accept favors from public service corporations, such as free light or free telephones. The principle upon which this decision is based is that any favors should be shown to the general public in the way of reduced rates, so that the entire public will receive the benefit.

IMPROVEMENTS TO FOLLOW INCREASE OF RATES BY INDIANA COMPANY.

THE North Vernon Independent Telephone Company has asked the City Council for a modification of its franchise so as to permit it to increase the present telephone rates of $1 and $2, for residence and business houses respectively. Originally the telephone system in this county was owned by private individuals and a 25-year franchise with the maximum rate of $1 and $2 was fixed. Since then the property has been taken over by the Independent Company, and notwithstanding the improvements already made the company has decided to expend $17,000 in adding to its equipment during the coming year. The council is said to be favorable to the grant and if it allows the change the improvements will be made at once.

A NEW ORGANIZATION FOR THE STUDY OF MATTERS CONNECTED WITH THE TELEPHONE.

ON October 16th, 1905, there was organized at Cincinnati, O., a society for the discussion of matters which would enable the members to increase their knowledge of the problems of modern telephone practice.

At the first meeting of the society a committee was appointed to choose a number of available names for the society, of which

Digitized by Google

one was to be adopted by vote of the members. The same committee was also empowered to draft a constitution. Messrs. Sandrock, Johnston, Lundy, Durham and Story were appointed of this committee, Mr. Sandrock acting as chairman, and Mr. Story as secretary of the committee. At a later meeting the committee reported results of its proceedings. The members voted that the society should be known as "The Cincinnati Society of Telephone Research," and the constitution was adopted as presented.

The founders of the society were elected to offices as follows: President, R. Hiltbrand; first vice-president, C. Durham; second vice-president, B. Seavers; secretary and treasurer, F. Arens; and G. Kappes was elected sergeant-at-arms. The society starts with a considerable number of enthusiastic members, representing various branches of telephone work, and there is every prospect of its being successful. The organization of bodies similar to this, for the discussion of telephone matters, should be extremely beneficial to all telephone men who wish to increase their understanding of methods of handling the work in which they are engaged.

INDIANAPOLIS TELEPHONE COMPANY OFFICIALS TAKE STEPS TO INSURE BENEFITS TO SUBSCRIBERS.

PRESIDENT STIFEL has announced the formation of a voting trust to hold the stock of the Indianapolis Telephone Company composed of H. C. Stifel, J. J. Robinson, J. S. Brailey, Jr., Breckenridge Jones, W. F. Nolker, Benjamin Altheimer, A. H. Bauer and Henry Kohler. The object of the trust is to render it impossible for any transfer of stock by death or otherwise to prevent the fulfillment of the promise of the company to expend a half million dollars in a fireproof building and other improvements in case it secures from the city permission to advance its rates.

STATE MEETING OF KANSAS INDEPENDENT TELEPHONE ASSOCIATION WILL BE HELD IN WICHITA.

A STATE meeting of the Kansas Independent Telephone Association will be held at the Carey Hotel in Wichita on January 22 and 23. Heretofore the annual conventions of this association have been held in Topeka, but this year it was decided to change the meeting place.

A large attendance is expected, it being thought that fully 250 members of the association from different parts of Kansas will be in attendance. Besides the members of the association who will be present there will be a large number of representatives of manufacturers who will have exhibits at the meeting.

A smoker will be tendered the visiting delegates the evening of the 22nd. Besides the regular business which will be transacted some important matters concerning the toll relations of the different Independent companies will also be taken up.

The officers of the association are A. E. Goddard, Topeka, president; S. M. Pearl, Hiawatha, secretary and treasurer.

NUMEROUS SPECIAL ATTRACTIONS PROVIDED AT THE CHICAGO ELECTRICAL SHOW.

ONE of the features of the electrical show which continues at the Coliseum until January 27, is "College Row." Purdue, Illinois and Wisconsin Universities have exhibits, and also Armour Institute. Purdue will send a hundred or more students to Chicago to visit the show and the University of Illinois will send the senior class of the department of electrical engineers to Chicago at the time of the exposition. Each of the spaces allotted to the universities will be decorated in the college colors.

The man who has not kept up-to-date on the subject of electricity in the household will find much of interest in this department of the exhibition. Complete kitchen equipments, including every variety of electrically-heated utensil, from a tea kettle to a griddle, are shown. The Chicago Edison Company and the Simplex Electric Heating Company exhibit complete cooking outfits, with which demonstrations are made for the benefit of the public. The Simplex Company does considerable of the cooking for the restaurant as well as the larger part of the laundry work for this department. The household devices also cover a vast number of novelties ranging from sad irons, milk warmer, curling irons, to electric heating pads which are used in place of hot-water bags. In contrast to these heating pads and devices may be mentioned the small ice-making plants which are operated by electric motors. These are suitable for small stores which carry perishable goods. A variety of medical apparatus and appliances are shown, such as vibrators and the like. The Chicago Edison Company prints a daily edition of the *Electric City* in the building throughout the exposition.

Among the most wonderful and interesting of the many demonstrations being made are the stunts that G. H. Thordarson, of Chicago, produces with 600,000 volts of electricity, making a marvelous electric spark nearly ten feet long. This is by the method known as the "high potential enormous frequency" current. For these experiments Mr. Thordarson has had specially made a sheet of plate glass weighing 700 pounds.

OHIO INDEPENDENT COMPANY USES JUBILANT ADVERTISING VERSES.

INSPIRED by the high degree of success achieved in its efforts to drive out the monopoly and make its efficient service afford the only medium of communication in the field it covers, the Hamilton Home Telephone Company, of Hamilton, Ohio, is using the following high spirited verses as advertising matter in the local papers:

WHY PATRONIZE THE
HOME TELEPHONE COMPANY.

In the year of our Lord nineteen hundred and two,
The Bell had the City, but phones were few.
The prices were high and tolls were too.
The Home began business, their service was fine,
They gave County free and installed farmer's line.

The first of the year nineteen hundred and six,
Found the old Bell in a very bad fix.
It advertised free telephones, to find out what to do,
'Twas battered and cracked, as every one knew
And our twenty-six hundred subscribers tell
The fate that awaits the poor old Bell.

HAMILTON HOME TELEPHONE COMPANY,

Contract Department, 'Phone, 900.

This presents a striking appearance on the page of the paper in which it appeared, and should afford a valuable suggestion to many companies which have built up their systems under similar conditions.

FIRE IN ZANESVILLE EXCHANGE EXTINGUISHED BY PLUCKY OPERATORS.

TWO Zanesville telephone girls are heroines by reason of their coolheadedness and practical good sense. They are Cora Ludman and Melva Gregg, employes at the Independent Telephone Company's exchange. A cross with a live wire outside sent a heavy current of electricity into the exchange, partially destroying the switchboard, burning out one of the big cables and doing $1,000 damage within a few minutes. The other girls in a panic flew down the stairs, and the males were paralyzed, but these two coolly went to a hand grenade rack, seized the extinguishers and put out the blaze before the city fire department reached the scene. The girls were found allaying the panic among the other employes of the company. The officials were highly pleased and say that the prompt action of the brave girls saved the $50,000 exchange, besides preventing possible injury to some of their fellow employes.

QUERIES

INSULATION OF LINES.—(645.)

Will you please inform me what should be the insulation resistance of lines in a common battery exchange, where 48-volt battery is used for toll connections? C. R.

The insulation should be so high and of such quality that the resistance between opposite sides of a pair will not be less than 50,000 ohms in wet weather.

CROSS WIRING.—(646.)

I enclose a sketch of our distributing cabinet, and would like to know how lines should be cross-wired. That is, should the jumper wires run straight across from the switchboard side to the fuses on the cable side, or may they be run in in any way that we want to connect them? G. F. D.

In Figure 646 is shown a conventional representation of a distributing cabinet, arranged for the termination of the switchboard cable upon lightning arresters, and of the outside cable conductors upon fuse terminals. Jumper wires are to run between terminals on the line side of the arresters and those on the switchboard side of the fuses. Switchboard wires are numbered individually from 1 to 52, and the cable conductors are numbered in pairs from 1 to 26. In the case of metallic switchboard circuits, 1 and 2 will form a pair, and cross wiring may run from the outside terminals of the arresters connected with this pair to the switchboard terminals of any two fuses associated with the twisted cable pair, as shown by the full lines representing jumper wires. It is not necessary that the switchboard pair composed of wires 1 and 2 should be connected to pair No. 1 of the cable, as shown by the dotted lines. In fact, the sole purpose of separating the terminals, and arranging the frame for cross connections, is to do away with the difficulties introduced by direct connections of similarly numbered pairs in the outside cable and switchboard cable. Among these difficulties may be mentioned the one which occurs when either an outside cable conductor or a circuit to the jack or drop in the switchboard gets in trouble. In this case, in order to avoid interrupting the service furnished to a subscriber, it is frequently desirable to make a temporary change to a new pair of cable conductors or to a new switchboard drop. If there were no cross wiring, this could only be accomplished by unsoldering the wires from their regular terminals, and either looping them back in an unsightly manner, or making a splice in the wires, which presents almost as unsightly an appearance as the former method, and introduces a new possibility of trouble. The use of jumper wires, which may run between any required terminals, does away with this difficulty.

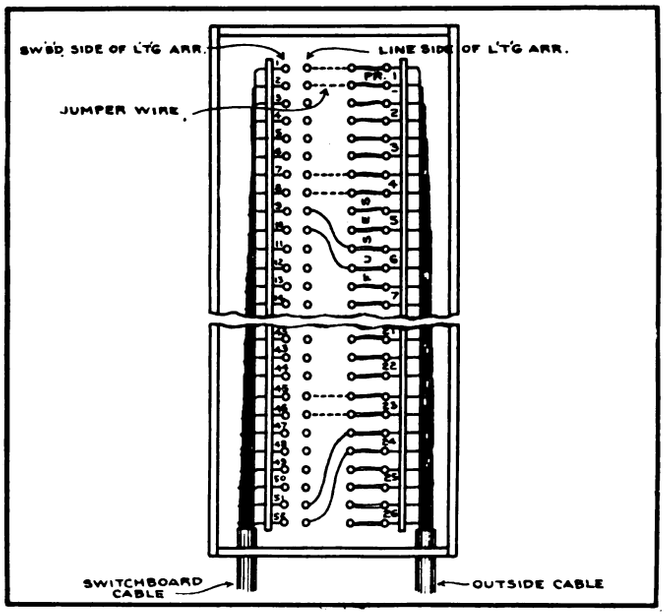

Fig. 646.

In a metallic circuit board, it is essential for the prevention of cross talk, and sometimes noise, that the twisted pairs of line and switchboard cables should be connected together; that is to say, it would not do to run No. 1 switchboard conductor to the second wire of pair No. 1 of the outside cable, and No. 2 to the first wire of pair No. 2 of the outside cable. This is called "splitting pairs," and is considered to be an evidence of careless workmanship on the part of the installer.

In case of a grounded line, one conductor of the switchboard pair is carried right through to the outside cable, while the other is grounded at the distributing box. In this case, also, a similar method of cross wiring may be used.

LOCATING WET SPOT IN CABLE.—(647.)

What is the best way to locate a wet spot in either aerial or underground cable with a bridge when all of the conductors are more or less grounded, and also where aerial wire is not available to connect up with the end of the aerial or underground? C. M.

There is at the present time no thoroughly practical method of locating water grounds in aerial or underground cable where it is impossible to employ the loop method, due to all conductors being more or less equally grounded through a water leak.

Methods exist for locating a ground where the use of a clear return circuit is obviated, but the difficulties introduced by the insulation resistance changing its value during the time of the test and difficulties existing in making simultaneous potential readings at the two extreme ends of a single wire render these methods of small utility for obtaining results of practical value.

RINGING NOISE.—(648.)

We have a small magneto switchboard which has been in use for some time. Until recently there was no trouble, but within the past few days the operator has been annoyed by a continuous ringing noise, which at times is very strong. We have tested circuits with a buzzer, and can find no cross between the ringing wires and other circuits. Can you advise us what the trouble is likely to be? L. A.

Such a trouble as you mention usually makes its appearance during a period of wet weather, and is probably due to poor insulation of ringing wires, or to dirt between key springs. To ascertain whether or not the trouble lies in the wiring it is advisable to disconnect the ringing leads both from the generator or pole changer, which ever may be the source of current, and from the ringing key straps at the switchboard. A temporary pair of wires run outside the keyboard cable may then be used as a substitute for the regular ringing leads. If the amount of noise is reduced to a negligible quantity, it will be evident that the fault lies in the wiring. The ringing leads should be examined for a point of defective insulation where they are in contact with other wires, and either have such defect repaired or replaced.

If this first method fails to locate the difficulty, it is almost certain to reside in the keys themselves. A small amount of dirt between springs will permit the passage of sufficient current to cause an injurious amount of noise. All springs and insulation should be carefully cleaned. In doing this work it would be well to examine the adjustment of keys and see that no springs are so near together that an accidental loose contact is possible.

The above method of procedure should enable you to obtain an idea of the nature of the cause of the trouble and to clear it. Such troubles are frequently very hard to locate definitely, owing to the unobtrusive character of the defects which cause them.

TELEPHONE PATENTS

SIGNALING APPARATUS.

K. H. Poyas, Los Angeles, Cal., patents (No. 808,868; dated Jan. 2, 1906: filed July 24, 1905; serial No. 270,960½) a telephone for test purpooses.

This device is particularly adapted for a lineman's test-call apparatus for use on lines connecting with automatic systems. It consists of a receiver provided with two button switches mounted in the shell. The normal circuit of the receiver is completed through the front contacts of these switches, but when it is desired to signal, by pressing either button the side of the line to which it is attached is grounded on a plate provided with a suitable connection for securing a ground circuit. Thus in signaling an automatic station pressing one button will operate the vertical switches, and pressing the other the rotary ones, according to the respective connections to either limb of the circuit and the ground.

TELEPHONE SIGNAL SYSTEM.

Amiel R. Hoover, Pleasant Hill, Ill., patents (No. 804,848; dated Nov. 21, 1905; filed April 20, 1905; serial No. 256,592, and assigns one-half to C. J. Craigmiles, of Pleasant Hill) a telephone signal system.

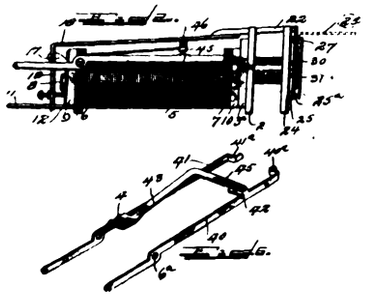
This invention relates to systems which do not require the services of an exchange for connections.

Besides the usual line circuit, connecting the various instruments on one line, there is an auxiliary pair of wires, including in their circuit, in series, a gravity battery and as many relays and closed contact switches as there are telephones. When one station desires to signal another the closed contact switch at the calling station is depressed. This opens the battery and consequently all the relays are disengaged. Their armatures then fall back and close local bell circuits. By code signals any particular station can be called by pressing the signal switch the desired number of times.

ANNUNCIATOR.

Albert Carliss, Chicago, Ill., patents (No. 808,723; dated Jan. 2, 1906; filed May 25, 1901; serial No. 61,961, and assigns to the American Electric Telephone Company, Chicago, Ill.) an annunciator signal for telephone systems.

The essential feature of this invention lies in the employment

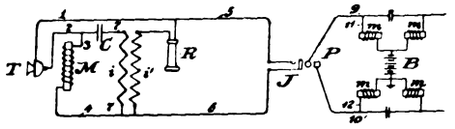


of the armature of an annunciator as a circuit closing device. Referring to Figs. 2 and 6, 5 is a magnet provided with end pole pieces 9, 10. The armature, 18, is pivoted at the point 17 and carries a stud, 46, made of insulating material. Two terminals, 40, 41, are attached to insulating blocks, 6, 7. Terminal 41 carries an arm, 43, having a right angle extension, 45, normally employed to hold the armature, 46, in its unoperated position. In this device it also serves as a contact point to engage an adjacent contact, 42. When the magnet is energized the armature is drawn downwards through the magnetic action communicated through the pole pieces, 9, 10, and besides releasing its indicating shutter closes the switch contacts, 45, 42, through the agency of the insulated button, 46. Upon de-energization of the magnet the spring member, 45, returns the armature to its normal position. By this arrangement the inventor secures the operation of the contacts on the initial movement of the armature, which may be done by a weak current, and then operate the shutter or drop on the further movement of the armature, at which time in some systems a stronger current may be available. The advantage claimed for this is that a pilot lamp circuit would be closed and indicate a line trouble which would prevent the passage of sufficient current to throw the drop.

TELEPHONE SYSTEM.

Henry A. Judge, Washington, D. C., patents (No. 809,186; dated Jan. 2, 1906; filed Sept. 9, 1905; serial No. 277,700) a telephone system.

The prime object in this patent is to increase the sharpness



and amplitude of the electrical waves set up by a transmitter. For this purpose the inventor provides a coil having a high coefficient of self induction which acts as a kick coil. The disposition of this coil with relation to the rest of the circuit is shown herewith. Lines 1, 2, 7 represent a circuit containing a transmitter, battery, and primary winding of an induction coil, *i*. Across the circuit thus completed is a bridge 3, 4, containing the electromagnet M, wound so as to have a very high coefficient of self-induction, but low ohmic resistance for continuous currents. Bridging the main line conductors 5, 6, is a receiver *R* in series with the secondary winding *i'* of the induction coil. *J* is the terminating jack at the exchange, and *P* a plug connected with a conventional source of current for central energy operation. In operation, current for the use of the transmitter flows through the coil M which is of low resistance. On account of its high self-induction, however, the variations due to the vibrations of the transmitter diaphragm are compelled to take the path through the condenser C and primary winding i of the induction coil. This causes the generation of higher potential alternating waves in the secondary circuit which traverse the lines to the distant station. Thus the currents due to the action of the induction coil are claimed to be sharpened and augmented by those passing direct to the line through the shunt path around the inductance coil M. The shunt path formed by the receiver is of a high resistance and does not appreciably diminish the supply of current necessary for the operation of the transmitter. The inventor also discloses means for adapting the circuit arrangement to local battery instruments.

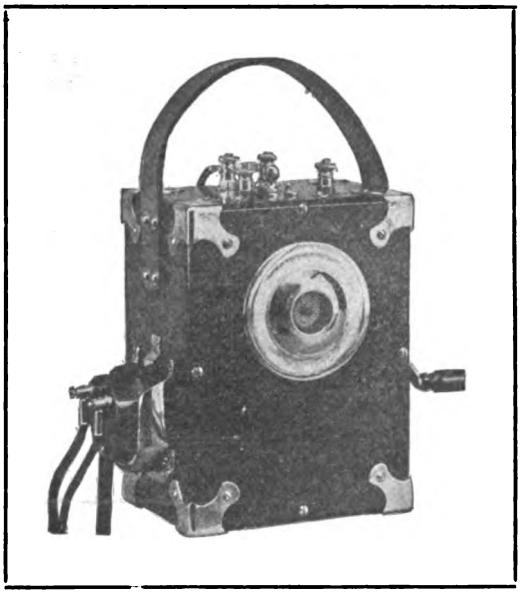
IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

A LINEMAN'S TEST SET.

IN many respects the ordinary lineman's test set leaves much to be desired. It is clumsy, excessively heavy, and using the receiver for transmitting, lacks clearness and reliability from the transmission standpoint. Noting these difficulties the Connecticut Telephone and Electric Company, of Meriden, Conn., has designed a test set which merits the attention of all telephone men. It is claimed to be thirty per cent. lighter than any other set upon the market. A solid back transmitter is mounted on the front surface and is furnished with current from two pocket dry cells. The ringer coils are silk insulated and are wound for either series or bridging work. The complete size of this instrument is 5½ x 7½ x 3¾. This instrument is available for use over long distances, and is suitable for testing electric light, telegraph and telephone lines as well as cable and wiring in buildings. It is in general use in the United States army. Besides its use as a test instrument it can be fitted with a cord and plug for street railway use. In this case weatherproof jack boxes are provided for mounting on poles. Further details of this instrument can be secured by writing to the company for its catalogue of test instruments.



Linemen's Portable Testing Set. Manufactured by Connecticut Telephone and Electric Company.

THE BAIRD MANUFACTURING COMPANY, Chicago, Ill., has recently issued booklet No. 101, entitled "Secret Service and What It Means." The major portion is given up to reproductions of letters from enthusiastic users of the Baird secret service system. Cuts of the selective mechanism are shown and accompanied with reading matter which sets forth the advantages of the instruments in a very clear and concise manner. The advantages noted not only apply to improvements in the service, but give reasons why the Baird system operates as an increaser of the revenue from lines on which it is placed. This booklet, together with complete information respecting the apparatus, will be mailed upon request.

THE GUARANTEE TELEPHONE AND EQUIPMENT COMPANY, of 60 West Van Buren street, Chicago, has changed its name, and will hereafter be known as the Edison Telephone Company. The firm members are exactly the same as before and there will be no change made in the policy of the company.

M. B. AUSTIN & COMPANY have removed to 133-141 West Jackson Boulevard, Chicago, in the new Continental Building. All inquiries relating to the well-known line of lock out telephones and supplies for outside construction put on the market by this company should be mailed to the new address.

THE EWING-MERKLE ELECTRICAL COMPANY, St. Louis, Mo., has published an interesting Christmas number of its Everbest Magazine. Amongst the interesting contents are some short stories which all have a moral. Two pages are devoted to hints relative to the care of motors and the fifth article upon the manufacture of incandescent lamps, dealing with baseing and final inspection affairs. In the advertising section, some interesting apparatus is listed, besides which the cards of several well-known manufacturers are given. The magazine on the whole is excellently gotten up and should prove interesting to all those into whose hands it falls.

THE STERLING ELECTRIC COMPANY, of Lafayette, Ind., has not been idle even though it has given out but little news of its doings for several months. The fact is, however, that it has been very busy filling orders for switchboards, telephones, condensers and protective apparatus. It reports its magneto-flash-light and magneto multiple switchboards as being among its best sellers with small exchange owners. The recently filled orders include large as well as small boards in exchanges located as follows: Joplin, Mo.; Los Angeles, Cal.; Buck Creek, Ind.; Toledo, Ohio; Huntington Beach, Cal.; Taylorville, Ill.; New York, N. Y.; Mayfield, Ky.; Galesburg, Ill.; Whittier, Cal.; Versailles, Ky.; Douglas, Kan.; Mars, Pa.; Winona, Minn.; Bloomington, Ind.; Clay, Ky.; Marion, Ky.; Providence, Ky.; Hawthorne, Pa.; New Philadelphia, Ohio; Tionesta, Pa.; Clarion, Pa.; Revere, Mo.; Viola, Ky.; Fancy Farm, Ky.; Manhattan, Kan.; Bolivar, Mo.; Uhrichsville, Ohio.

MATHIAS KLEIN & SONS, 79 W. Van Buren street, Chicago, Ill., have a forty-eight-page catalogue which will be mailed to any one on receipt of a two-cent stamp. This catalogue contains complete descriptions of all kinds of tools suitable for linemen, inspectors, and instrument installers. The firm has made a specialty of these tools and is therefore in a position to furnish the right article at favorable prices. One of the tools listed is a reversible combination wire and sleeve clamp which will be found of the greatest value in splicing line wires. Its catalogue number is 309, and parties interested should write for further particulars.

THE STROMBERG-CARLSON TELEPHONE MANUFACTURING COMPANY, Rochester, N. Y., reports having closed contracts for switchboards for the following places: Tremonton, Utah; Columbus, Ohio; Robinson, Ill.; Lakewood, Ill.; Chillicothe, Mo.; Garland, Utah; Holt, Mo.; Houlton, Me.; Bingham, Utah; Harrisonville, Mo.; Fulton, Kan.; Jamestown, N. Y.; Spanish Fork, Utah; Tonopah, Nev.

SEEING IS BELIEVING.

AT the Chicago Electrical Trades Exhibition, the General Storage Battery Company is showing, in addition to a full line of Bijur "High-Duty" plates and batteries, a working "Booster system" handling violently fluctuating loads while maintaining a steady load on the generator.

This is accomplished by a "Bijur" Automatic Regulator working on a new principle achieving results which will be well worth seeing. By closing the large solenoid switch on the front of the exhibition board, instantaneous loads of 2,000 amperes are

drawn from a cell whose normal capacity is 84 amperes. By the use of the booster system there is obtained such regulation that, of this 2,000 ampere jerk, only 9 amperes, or less than ½ of 1 per cent., reach the generator. The company is also showing a full line of cells for railway and yacht lighting work, as well as its well-known type of battery for telephone service.

TELEPHONE TALK vs. JEWELRY.

AMONG the "local Edisons" in the telephone field is one Mr. Ashley McKinley, of Marissa, Ill., who devotes the greater portion of his time to hustling for Wesco telephones down in the land of Egypt. Among the many amusing stories of his experiences, he relates an incident of his recently installing a farmers' telephone line. Having connected the first two instruments on the line, he rang up from the second instrument to the first to see if they would work properly. A voice answered the call and McKinley said, "Hello! who is this?" "Jakie Spieler," came the reply. "All right, Jakie, let me have three long rings," said McKinley, wishing to know if the second station would respond properly to a signal. All was silent for some moments and McKinley began to think there was trouble in the ringer, so he rang back again to the first station and soon received a reply. "Hello! who is that?" said McKinley. "Jakie Spieler," again was the reply. "Well, Jakie, why don't you send me those three long rings?" "What!" said Jakie, "Did you leave those three rings here?—I have been out in the yard looking for them."

A BRIDGING PARTY LINE SYSTEM.

THE conditions necessary for economical operation and other features of the use of rural party lines frequently make it desirable to have a large number of telephones connected to one line. In order to increase the number of instruments which may be connected to a line, Charles A. Wardner, of Brushton, N. Y., has invented a device which is illustrated on this page.

A specially constructed switch, shown at S°, Fig. 1. placed just above the receiver switch hook, bears a rubber handle projecting from the side of the telephone, by which either the ringing circuit or the talking circuit can be changed from metallic to grounded, thus allowing one pair of telephones to carry on a conversation over the metallic circuit at the same time that two other telephones are carrying on a conversation over the grounded circuit. When properly installed and the metallic circuit kept free from ground contacts it is claimed that there will be no cross talk nor induction.

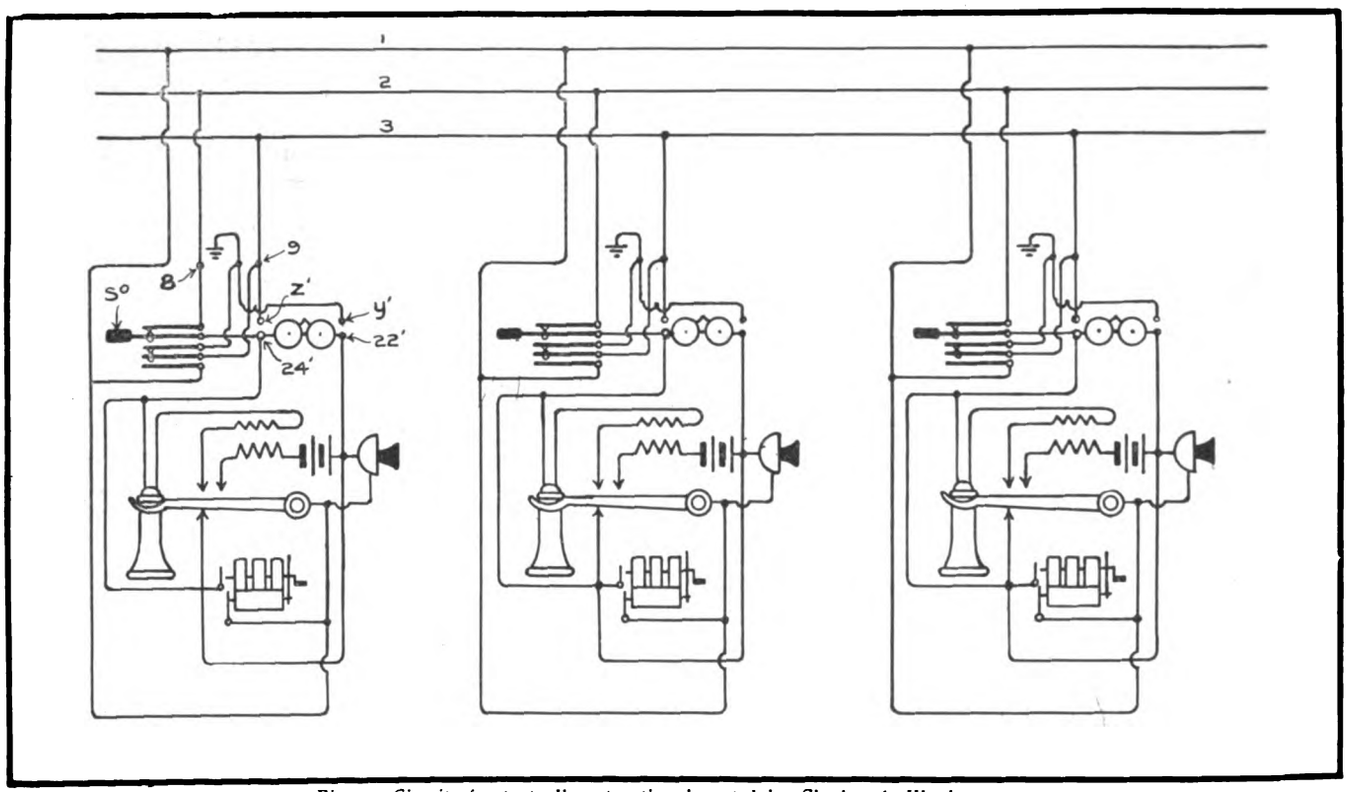

Fig. 1. Circuits for party line operation invented by Charles A. Wardner.

The inventor states that telephone instruments equipped with the special switch can be used anywhere and in any way that ordinary bridging telephones can be used. Thus a rural party line can be constructed with single wire ground system and use telephones so equipped just the same as ordinary telephones. Later on, when finances will permit, another wire can be strung, making the line metallic. The system can then be changed in two different ways: First, by leaving all ringers connected metallic, the talking capacity will be doubled, one circuit metallic and one grounded. If the line connects with a switchboard, central can be rung without ringing any other telephone on the line by depressing switch handle s° while calling central. Second, double the number of telephones can be used on the line if half the ringers are connected to ground by shifting the ringer clips 22' and 24' to contacts y' and z' and wire No. 2 is connected to both binding posts 8 and 9. Half the telephones can then be rung in the ordinary way and the other half rung by depressing the switch handle s° while ringing code signals. With the telephones arranged in this way the line can be connected to a common single wire grounded line without the use of a repeating coil. If the volume of business on the line should warrant it, both the talking capacity and number of telephones can be dou-

bled by stringing a third wire as shown in Fig. 1. This wire carries grounded ringers only.

Fig. 2 shows in detail the construction of the special switch and its location in the telephone. This switch is entirely self-contained, the base being stamped or cast in one piece, one end of which forms the escutcheon for the lever. The other end carries the contract springs insulated from each other with hard rubber or mica, also from the lever, so that it forms no part of the circuit. Fastened to the inside of the telephone is a hook W with a cam face made to engage with the receiver switch

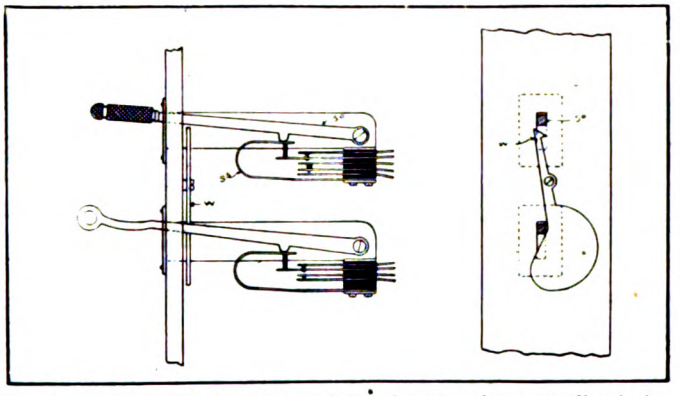

Fig. 2. Details of hook switch and key for operating party line device.

lever in such a way that when the receiver is hung up the hook end is thrown back out of the path of the switch lever s^0, thus the lever cannot be hooked down with the receiver hung up. When the receiver is removed and the switch lever s^0 depressed, the hook end will hold the lever down so that conversation can be carried on over the ground circuit, but when the receiver is again hung up the lever s^0 is automatically released and the spring s^5 causes it to return to its normal position, thus restoring the instrument to metallic connections.

AUTOMATIC ELECTRIC COMPANY REPORTS LIST OF INSTALLATIONS.

THE Automatic Electric Company of Chicago reports a most prosperous year's business during 1905, with every prospect of greatly increasing it during 1906.

The following exchanges have been completed during the past year:

Among the developments of this system during the past year which are notable are those of the party-line system and a new trunk selector switch. This switch takes up very much less space than the first selector switch used by the company, and will admit of the installation of a multiple unit system consisting of scattered branch exchanges of one hundred lines each which can be put in the corner of a building, in the manhole of a conduit under the street, or any convenient place, leaving the main exchange in the central part of the town for trunking purposes.

THE MONARCH TELEPHONE MANUFACTURING COMPANY, Chichicago, Ill., is placing on the market a simple device to stop the vibrations of the ringer gongs when the receiver is removed from the hook. A bent wire lever rests upon the switch hook and has two prongs provided with leather damping washers which extend through the woodwork of the ringer case from the inside of the gongs. The removal of the receiver from the switch hook tilts the lever and causes the prongs to press against the inside of the gongs, stopping their vibrations. This device is termed a Gong Damper and is furnished with all Monarch compact type instruments. As the mechanism is extremely simple there is no possibility of trouble and therefore it can be relied upon to work under all conditions. The new catalogue which this company has gotten up describes this feature as well as all other Monarch appliances and instruments. It will be mailed free to parties interested.

SIMPLICITY

is the Keynote of Success

A simple device which accomplishes the same results as a more complex one is certainly more preferable. The Sandwich Pole-Changer is the simplest device ever constructed for ringing purposes. There are but three contact springs and as these engage alternately with their opposite sides they cannot be forced out of position by constant use.

It requires no adjustment, as this is done at the factory and is permanent.

The use of a primary constant current battery to operate the vibrator has been dispensed with; a minute quantity of current, hardly a milliampere, being taken from the ringing battery, through suitable resistance coils for this purpose.

It will work in either a vertical or horizontal position, which permits it being hung on a wall or mounted on a cabinet. Another excellent feature is that it is practically noiseless. There are others which are described in our free booklet. Let us send it to you.

THE SANDWICH POLE-CHANGER CO.

400 EDDY STREET, SANDWICH, ILL.

CHEAP VS. EFFICIENT SERVICE

The cheapest telephone service in the world is dear at any price if it is not efficient.

When a man installs a telephone he wants to be able to use it and not to abuse it.

A grounded line nine times out of ten is noisy, and foreign noise on a telephone line will arouse a feeling of anger in the heart of the user that isn't good for the company. You can keep your lines free from grounds and other troubles by periodic tests with a Pignolet voltmeter, and when they do occur, you can locate them with this instrument, and get them cleared often before the subscriber knew his line was in trouble.

If you need your subscribers' good will, you need my voltmeter to get it.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit

78 CORTLANDT ST., N. Y.

FINANCIAL.

HEBRON, ILL.—The Farmers' New Era Telephone Company has declared a dividend of 9 per cent. on its capital stock of $15,000. Its capital stock has been increased to $25,000 for the purpose of extending its system.

LOUISVILLE, KY.—The Louisville Home Telephone Company on January 1st paid its regular six months' dividend of 1½ per cent., and declared an extra dividend of 1 per cent. on its stock.

RED OAK, IA.—The Red Oak Mutual Telephone Company has increased its capital stock to $15,000.

RIDGELY, MD.—The Farmers' & Merchants' Telephone Company has increased its capital stock to $25,000.

GRAND RAPIDS, MICH.—The Citizens' Telephone Company has declared its quarterly dividend of 2 per cent.

COLUMBIA, N. Y.—The Columbia Telephone Company has increased its capital stock from $50,000 to $200,000.

FRANCHISES.

HEATH, MASS.—The Heath Telephone Company has applied for a franchise at Whately.

LONGBEACH, MISS.—The City Council has granted Richard Inglis a franchise to construct and operate a telephone system in Longbeach.

CANTON, MO.—The Citizens' Telephone Company, of Canton, Mo., has secured a franchise at Lewiston, Mo., and will install a modern system at that place.

KANSAS CITY, MO.—The Home Telephone Company, of Kansas City, has been granted a franchise at Carrollton. The company expects to spend $100,000 in installing plant.

KIRKSVILLE, MO.—Mat Muldoon has been granted a franchise for a telephone exchange in Kirksville.

NEW CARLISLE, O.—The Home Telephone Company has been granted a franchise in New Carlisle.

NEW LEXINGTON, O.—The Crooksville Telephone Company has been granted a franchise in New Lexington, O.

ROANOKE, VA.—The Virginia-Tennessee Telephone Company has secured a franchise at Roanoke, and will commence the construction of a telephone system.

COMBINATIONS.

PANA, ILL.—The Pana & Christian County Telephone Company has been acquired by the Interstate Telephone Company, of Taylorsville.

KANSAS CITY, MO.—The Home Telephone Company, of Kansas City, Mo., has purchased the telephone system at Richmond, Mo., and intends to rebuild the entire system at once. The company has also purchased the telephone system at Norborne, Mo.

MARYSVILLE, O.—All the Independent systems which are now in operation in Union County are to be combined under one head. The new corporation will be known as The Union County Telephone Company, capital $200,000, the following being the incorporators: Newton F. Liggett, Walter C. Fullington, William O. Shearer, George F. Whitney and H. E. Courtright.

BRIDGEWATER, S. D.—The Bridgewater Union Telephone Company has been acquired by J. J. Henrich, of that city.

WRIGHTSTOWN, WIS.—The Fox River Valley Telephone Company has bought the system of the Wrightstown & Western Telephone Company, operating in Wrightstown, and also having a toll line running to Freedom.

ELECTIONS.

PITTSFIELD, ILL.—At the annual meeting of the Farmers' Co-Operative Telephone Company of Pike County the following officers were elected: H. T. Shaw, president; J. F. Lacy, secretary. The company contemplates installing a central office at Pittsfield.

SOMERS, ILL.—Trustees for the Somers Township Telephone Company have been elected as follows, Martin Brownfield, three years; M. C. Busey, two years, and P. P. Dunn, one year. The trustees have elected the following officers: President, Fred Schroyer; vice president, George M. Carray; clerk, W. Schiff; treasurer, J. P. Connerty.

MUSCATINE, IOWA.—The Muscatine Central Telephone Company has re-elected the following officers: W. C. Healey, president; W. Houseman, vice-president; Joseph Gibbs, secretary; W. P. Hitchcock, treasurer. A dividend of 6 per cent. was declared.

MEDIAPOLIS, IA.—The Mediapolis Mutual Telephone Company has elected the following officers: President, Hy. Breder; vice-president, Herman Walker; secretary, J. L. Jones; treasurer, David J. Kelly.

CEDAR RAPIDS, IA.—J. M. Rider has been elected secretary of the Cedar Rapids and Marion Telephone Company.

YARMOUTH, IA.—The Mutual Telephone Company has elected the following officers: President, Charles Kurtz; treasurer, S. Koerner; secretary, John Keuchman.

NORTH BEND, NEB.—Fred A. Howe has been elected president of the Farmers' Telephone Company.

CLINTON, N. Y.—The Clinton Telephone Company has elected the following officers: President, I. H. Griswold; vice-president, B. S. Ramsay; treasurer, I. Merkel; secretary, E. L. Graul.

CONKLIN, N. Y.—The following officers have been elected by the Conklin Telephone Company: J. L. Engelbert, president; L. C. Benedict, vice-president; C. R. Webb, treasurer; A. R. Vosbury, secretary. The company expects to build a new line to Kirkwood.

ROME, N. Y.—The Rome Telephone Company has elected the following officers: President, J. S. Wardwell; vice-president, D. M. Hall; secretary, A. L. Ketcham; treasurer, C. H. Poole.

BENTON RIDGE, O.—The Farmers' Mutual Telephone Company has elected the following officers: President, A. J. Whistler; vice-president, M. H. Kirtland; secretary, J. W. Powell; treasurer, Daniel Jackson.

BRIDGEPORT, O.—The stockholders of the Belmont Telephone Company at their annual meeting elected a board of directors as follows: Hon. J. C. Heinlein, Dr. A. J. Heinlein, J. C. Dent, Hon. C. L. Weems, of St. Clairsville; Henry Schmulbach, of Wheeling; J. W. Doudna, of Barnesville, and Fred Neininger.

GRATIOT, O.—The Gratiot and Brownsville Telephone Company has elected the following officers: President, S. E. Porter; vice-president, George G. Ardrey; treasurer, G. D. Orr; secretary and general manager, C. C. Zartman.

JOHNSTOWN, PA.—The Johnstown Telephone Company has elected the following officers: President, Charles Griffith; secretary, P. F. McAneny.

BLISS, VA.—At the annual meeting of the stockholders of the Opequon Telephone Company the election of officers resulted as follows: President, C. W. Snapp; vice-president, J. W. Richard; secretary, Tilden Snapp; treasurer, J. A. R. Snapp. Dr. I. M. Brumback, T. F. Fawcet and J. B. Bywaters, with the above officers, are the board of directors.

NEW COMPANIES.

CHARLOTTE, ARK.—The Charlotte Telephone Company has been incorporated with a capital stock of $1,500. The officers are W. P. Jones, president; J. C. McGill, vice-president; C. H. Hogan, secretary and treasurer. The company will build a line from Charlotte to Batesville.

HUGO, COL.—The Lincoln Telephone Company has been incorporated with a capital of $50,000. The company will build lines into Lincoln and other places.

DONGOLA, ILL.—The Dongola Home Mutual Telephone Company, Dongola, has been incorporated with a capital stock of $2,500. Incorporators: B. P. Crabtree, Thomas R. Baugh and J. F. Karraker.

NEWS—WANTED

THE matter contained upon the Message and Operating Field pages of this paper is contributed largely by our special correspondents. We believe, however, that there are many valuable items of telephonic interest which are never brought to the attention of the public. There is no reason why this condition should exist, and the Editor, therefore, invites all telephone companies and the officials of such companies, to furnish any information that they can consistently make public relative to financial statistics, new construction, elections, franchises and personal items.

OUR MOTTO—QUALITY AND PROMPT SHIPMENTS.

KELLOGG "MICHIGAN WHITE" CEDAR POLES

THE poles we handle are all carefully selected, and are the best grade of stock.

All shipments are prompt, subject only to car supply.

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices.

We have recently published a little book giving some very valuable information about Cedar Poles. It contains Specifications, Inspection Comments, Shipping Data, Etc. "Yours for the asking."

GRAND JUNCTION, IA.—The Farmers' Telephone Company is building a line from Grand Junction to Rippey.

YOUNGSTOWN, IND.—The Honey Creek Mutual Telephone Company expects to overhaul its system and build new lines in Youngstown and the surrounding country.

SIDNEY, IA.—The Knox Mutual Telephone Company is to build lines to Knox, Thurman, Percival and Hamburg.

BARCLAY, KAS.—The Barclay Telephone Company expects to make many changes and improvements in its system.

LENEXA, KAS.—The Lenexa Telephone Company has completed its rebuilding operations and will now begin to extend its country lines. The exchange has recently been moved into a new office containing new switchboard equipment.

THAYER, KAS.—The work of constructing a rural telephone line west from the town of Thayer is being carried on by John Hamlin and others, of Thayer.

LOUISVILLE, KY.—The Louisville Home Telephone Company is building at Pewee Valley and Anchorage, Ky., new exchanges which it expects to have in operation within a short time.

EGAN, MICH.—The Citizens' Telephone Company is building a line to Hamilton.

FAIRMONT, MINN.—The Fairmont Telephone Company is to build an additional farmers' line.

SWANVILLE, MINN.—The Morrison County Telephone Company is building a line from Swanville to Flensburg.

JACKSON, MO.—J. L. Boyle is to install a new switchboard in his exchange at this place. Arrangements are being made to build new lines to Chillicothe and Trenton.

SEWARD, NEB.—The Seward County Telephone Company is to build a line from Seward to Milford.

PLYMOUTH, N. H.—The Plymouth & Campton Telephone Company is to build additional lines.

DOUGLAS, N. Y.—The Douglas Telephone Company expects to extend its lines to La Prele and Box Elder settlements.

FRANKFORT, N. Y.—The Frankfort, East and West Schuyler Mutual Telephone Company contemplates making many improvements and additions to its system.

PARISH, N. Y.—The Ontario Telephone Company, which has just completed a line to Dugway, expects to build several additional lines.

MANDAN, N. D.—The Mandan Telephone Company expects to spend a large sum of money in improving and extending its system.

ARCADIA, O.—The Arcadia Telephone Company is building a toll line to Van Buren.

NEY, O.—The Ney Telephone Company contemplates building several new lines on the territory adjacent to Sherwood.

CORNELLSVILLE, PA.—The Somerset County Telephone Company is extending its lines to New Lexington.

WAYNESBURG, PA.—The South Penn Telephone Company, of Waynesburg, has recently completed the construction of a new line to Old Concord.

PORT LAVACA, TEXAS.—Messrs. Sol Marsh, John Deck and M. J. Davis are planning to install a new telephone system in Port Lavaca. A new switchboard will be installed, and a new line constructed between Port Lavaca and Victoria.

COX'S LANDING, W. VA.—The Cox's Landing Telephone Company is to build a line to Guyandotte.

Stop and Do Some Quick Thinking
before you set that lot of new poles.
HERE'S THE REASON
A creosoted pole treated by our process lasts indefinitely. Poles not so treated must be replaced in from five to ten years. If you want your net earnings to increase you will readily see why you should take our advice.
We are experts in wood preservation and can help you if you will let us. Write for our Booklet.
Norfolk Creosoting Co., Norfolk, Va.

Digitized by Google

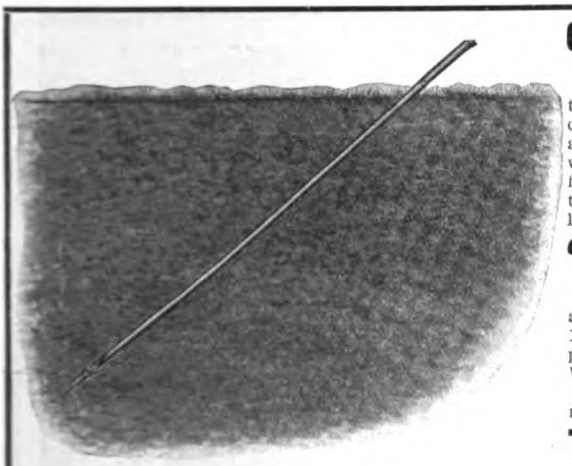
THE CORD THAT LASTS.

This cord consists of two steel piano wires covered with a spiral of fine copper wire. The cord is then insulated with a silk and cotton insulation and each conductor is covered with a cotton braid, one of the conductors having a red tracer so as to distinguish it from the other. The conductors are then formed into a spiral and covered with a heavy, waxed, gray Gilling Thread.

"EACO" STEEL SWITCHBOARD CORD

will outlast anything on the market. Write and get prices, and when doing so state what make of switchboard you are using.

ELECTRIO APPLIANCE COMPANY, Telephone Manufacturers, CHICAGO SAN FRANCISCO



One Hour, or One Minute, WHICH?

Setting an anchor used to be a tedious operation. A big hole was dug about five feet deep and into this a log, to which a wire was attached, was placed. Then the hole had to be filled up and the ground thoroughly tamped. It generally took about an hour.

COMPARE THIS WITH THE D & T ANCHOR

You drive the anchor for 45 seconds and then give it a twist, which takes 15 seconds, and you have accomplished the job in just one minute. Worth looking into, isn't it?

Write for booklet and miniature model.

THE D. & T. ANCHOR CO.
La Crosse, Wis.

TYPE A—10-Pair Hall Cable Box.

CABLE TERMINAL EFFICIENCY.

A great deal of the efficiency of a cable plant depends upon the terminal and distribution facilities. And what is more, the type of terminal is of the greatest importance. Some of the points to be considered in its selection are protection, "getatability," compactness, rigidity. Considering these features collectively or individually you cannot find a terminal on the market that is superior to the HALL. Protection was given the greatest attention in its design so that when you buy a

HALL CABLE TERMINAL

you have bought protection against lightning, sneak currents, or crosses with dangerous circuits. The "getatability" of the Hall is unique. When the cover is taken off the top, bottom, front and back are exposed. No opportunity here for faulty inspection.

Compactness? Just look at the illustration. That tells its own story.

Rigidity? An all-metal framework carries the terminal plate. We couldn't make it stronger if we tried.

Seems to us you ought to get prices. Your name and address will bring them, and some more facts that will be of value to you.

ABOUT SWITCHBOARD WIRE

"NORTH'S" switchboard wire is of perfectly annealed copper of uniform cross section and drawn in gauges from 19 to 24, inclusive. The wire is tinned for soldering at all points and to protect the insulation from copper corrosion.

It is wound with Italian Tram silk and then covered with Sea Island cotton, both in single filaments or threads, and with the maximum number of turns per inch.

Cheap switchboard wire, like magnet wire, is made by applying a large number of threads at one time in the form of a ribbon, wound at a long angle in order to cover the wire with the smallest number of turns.

Sea Island cotton yarn, for the outer winding of "NORTH'S" wire, is colored to a standard code with dyes free from acid or chemicals tending to lower its insulation.

The beeswax compound, the result of long experience, is also free of acid or any foreign matter. The wire is saturated for several hours in the boiling compound and the spools are taken out and revolved slowly until the wax is perfectly smooth and hard. If this were not done, the hot wax would run to the bottom of the spool and the insulation would not be perfectly saturated.

"NORTH'S" switchboard wire is made under rigid specifications and the materials are tested and inspected before they are used.

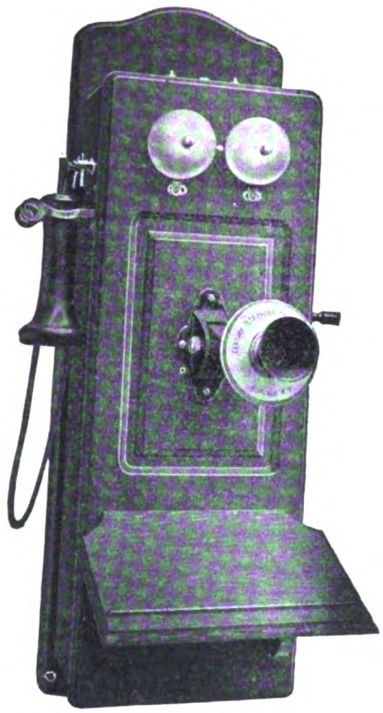
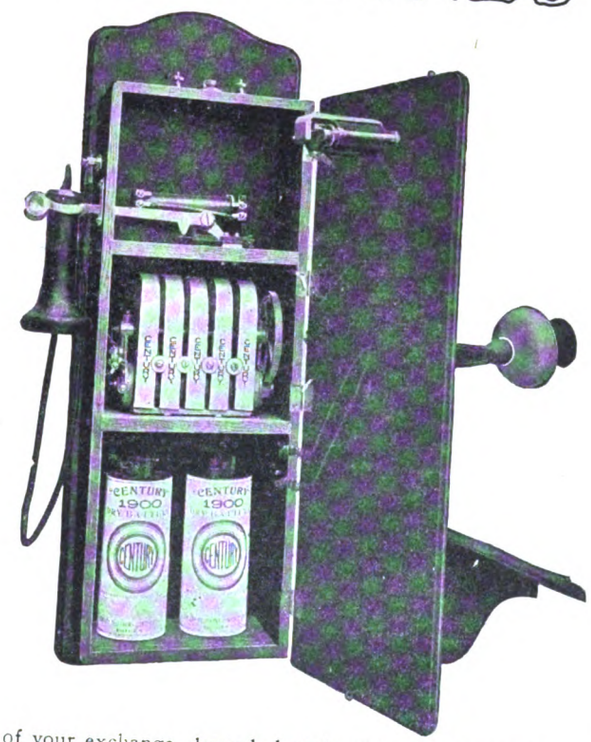
CENTURY
100% GOOD

MAGNETO TELEPHONES





The quality of your service, also the earning power of your exchange, depends largely upon the apparatus you are using.

Therefore, is it not good policy to use nothing but the very best apparatus?

Our No. 65 magneto telephones will give your subscribers the very best service. Their use will also increase your dividends by reducing to the minimum your maintenance charges.

Our No. 65 magneto telephones have been carefully developed and perfected to such an extent that they can be relied upon for perfect service at all times.

These telephones are made up in all the different types, for all classes of service.

You may make a thorough test of these telephones; we will send you one or two series bridging instruments on 60 days' trial, charges prepaid.

Don't you think this offer is worth considering? Send us an order.

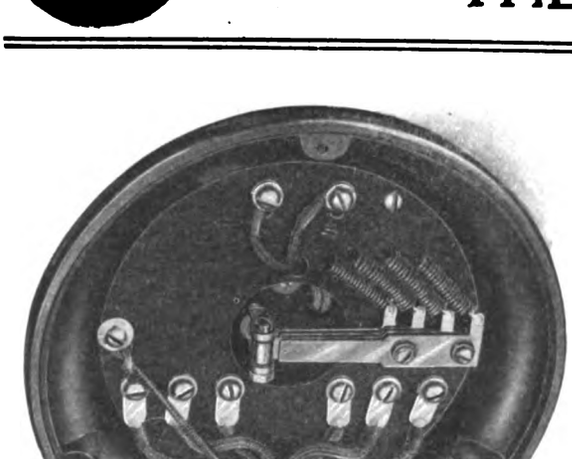
MONARCH APPARATUS

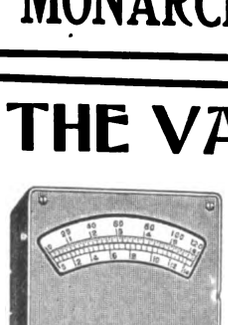
THE DESK SET



All wiring of a Monarch Desk Stand terminates in the base. The transmitter connections are metallic, and are brought down in two conductor silk cord. The hook switch springs being mounted upon the base, no other wiring passes through the pedestal tube. The connecting plate is made of hard rubber. All connections are plainly marked. Clips are provided for the receiver and connecting cords. All connecting plates are interchangeable. Local battery desk sets can be made to common battery by changing the connecting plates and transmitters. All Monarch Telephone Apparatus is described in the new catalogue. A copy will be sent upon request.

MONARCH TELEPHONE MFG. CO., 10-16 SOUTH CLINTON STREET CHICAGO, ILL.

THE VALUE OF A MEASURING INSTRUMENT



Suppose you have a line in trouble—grounded or open. You don't know the exact location, but you send out a troubleman to hunt it up and clear it. It may take him an hour or a day. Meanwhile the subscriber is getting hot under the collar and saying things about telephones in general and yours in particular.

If you have a Pignolet voltmeter or volt-ammeter you can determine the approximate location and also get an idea of the nature of the trouble. With the information your troubleman can find the fault in jig time, and you will have prevented the subscriber kicking by giving him service at the earliest possible moment.

Does it pay to be informed? You ought to know.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit

78 CORTLANDT ST., N. Y.

DEAN TELEPHONE APPARATUS

"There Must Be a Reason."

SIMPLICITY

All of our telephone apparatus has been designed with simplicity as one of the foremost requirements—the simplicity that cuts down maintenance expenses without impairing efficiency.

This simplicity has made us many friends not only with the operating companies but with their patrons—friends of the former by reason of ease and dispatch in handling and operating and friends of the latter by reason of positive results with the least effort.

The phenomenal increase in our business is due in a great measure to the extreme simplicity of our apparatus.

It will pay you to try the celebrated Dean product in your new year's construction.

Evidence to Prove All Our Claims

for the Generator Call Visual Signal Switchboard, we have been telling you about the last few weeks.

CITIZENS' TELEPHONE COMPANY OF LAWRENCE CO.

LAWRENCEVILLE, ILL., 9-17-'05.

Stromberg-Carlson Tel. Mfg. Co., Rochester, N. Y.

Gentlemen: Replying to your favor of the 16th inst., I am pleased to advise that the Visual Signal Switchboard purchased from your company, a little over a year ago, for our Summer exchange is giving perfect satisfaction. In view of the almost extravagant claims you made for it, I expected to be disappointed in some of the particulars, but the only disappointment met with so far is that the board has fulfilled every promise you made for it.

Wishing you much success, I am,

Yours very truly,

G. H. CUNNINGHAM, Mgr.

What better evidence do you want that this is the switchboard for you to buy, than facts of this kind from the user? If you could have an opportunity to see one of these boards operate, you wouldn't want any other evidence to prove its high quality. There are a good many of them in use. Maybe there is one in your territory to which we can refer you.

Let us mail a copy of our bulletin and quote you prices. Remember we have standard cabinets of 60, 70, 100, 140, 180 and 200 lines.

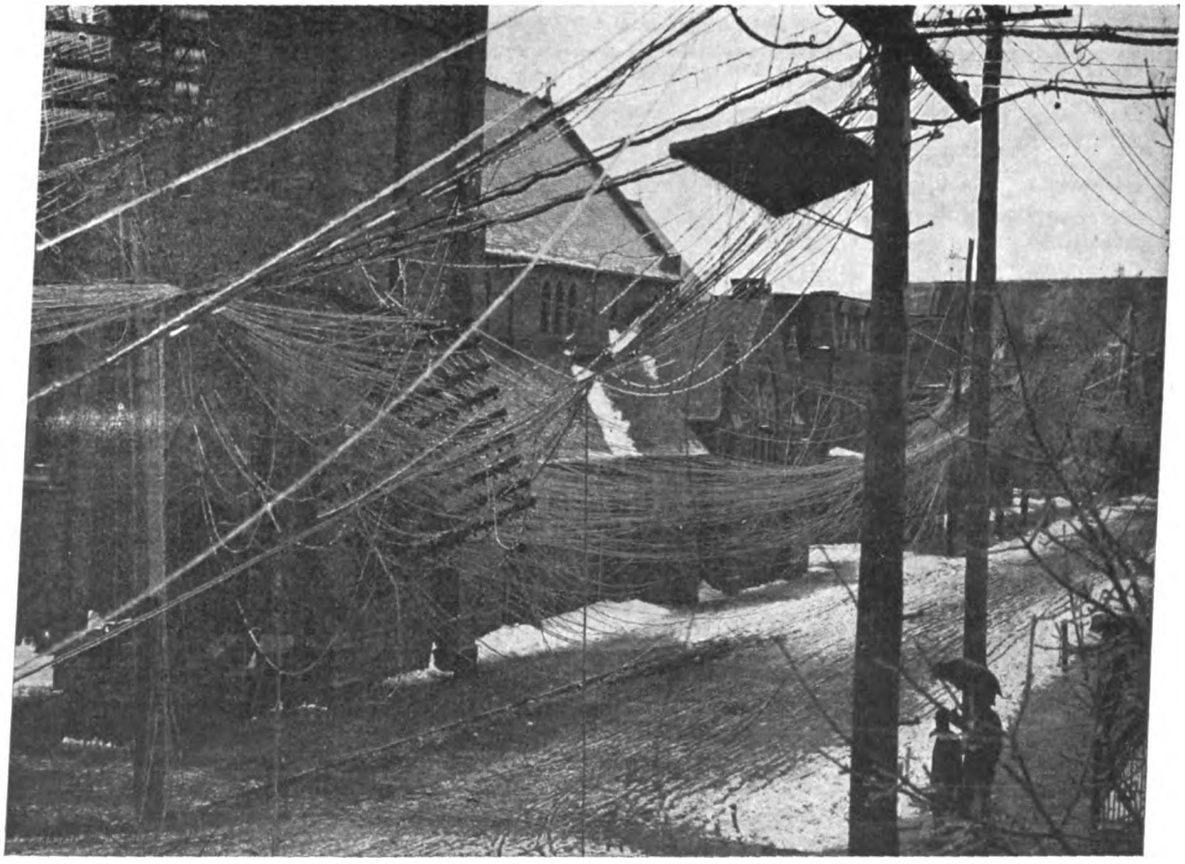
WE MAKE CABLE

No. 2—MORAL DAMAGE

Aside from the physical loss incident to a wreckage of open aerial lines, there is the moral effect it has upon the community at large. When a man subscribes for continuous telephone service, he expects to get it, and adjusts his business accordingly. The telephone becomes a part of his individual machine and is of even more importance than the mail. On the other hand the company contracts to deliver such service to the best of its ability. If it fails for any cause, no matter what, it at once becomes the butt of the most unreasonable criticism.



One bad apple will turn a whole barrel; similarly one unreasonable patron may be the cause of inestimable loss to the company at a time such as this. Accidents will happen but the most logical argument is to take such precautionary measures that will leave nothing undone that could prevent them. The use of cable is the most justifiable precautionary measure you could employ. If correctly installed, you have done everything in your power to prevent breakdowns or interruptions to the service.

Write for the Cable Book—It's Free.

No. 3—Mental Damage Will Run Next Week

NEARLY 90 PER CENT.

of all the telephone exchanges (both new and replacements) sold in the United States during the past few years have been

OUR AUTOMATIC SYSTEM—BECAUSE

It improves the service; being perfect, prompt and absolutely private, thus supplying a logical reason for advancing rates which have been too low.

It lowers the expenses; costs 50% less to operate and maintain than a manual exchange.

It makes it possible for the operating companies to pay good dividends on their stock, thus

It enhances and steadies the values of telephone securities, making and keeping them a safe, desirable and profitable investment.

Our automatic system adopted in the following cities:

CHICAGO, ILL.	SOUTH BEND, IND.	ALBUQUERQUE, N. M.	WESTERLY, R. I.
GRAND RAPIDS, MICH.	ABERDEEN, S. D.	TRAVERSE CITY, MICH.	MANCHESTER, IA.

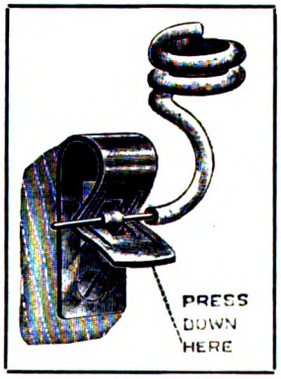
AUTOMATIC ELECTRIC COMPANY

Van Buren and Morgan Streets - - - - - CHICAGO, U. S. A.

SOME ONE

has said that the difference between a wet battery and a dry battery lies in the fact that a wet battery gets dry and a dry battery stays wet. Staying wet is the thing that has made the dry cell popular. Staying wet means a lower cost of keep per year per cell, and that is just what the



Fahnestock

Spring Binding Post

means. It means that the cells are connected up more quickly and easily. It means that when they are connected up they stay so and you are never bothered with loose connections, corroded contacts or broken wires.

It means that if your dry cell has a certain capacity you are going to get all of that capacity out of it and not lose any overcoming the resistance of a loose or dirty contact; and it doesn't cost you a cent to have this connector on your cells. Ask for it on your next order, no matter what make of battery you are using.

An Emergency Telephone

By John Grant.

IN the Park Row Building, in New York City, is an elevator shaft containing ten cars. These cars carry passengers from the street level as high as the twenty-fifth floor, and the number of trips they make and the number of persons they carry each day runs to a very high figure. Not only is the number of persons large, but from a business standpoint the importance of the individuals who find occasion to use these elevators is recognized as the highest. In this building are located the offices of men and of corporations which represent some of the largest interests in the country. In a city where there is such a daily concentration of immense activity by the greater number within the few hours spent in the business district, which is comparatively remote from residences, it is of the greatest importance that the amount of time lost in moving from place to place should be reduced to a minimum. The aggregate value of the time spent by all the passengers in the elevators of this building alone would reach several hundred dollars each day if computed on the basis of their earning capacity. Such being the case it is the obvious duty of the management of such a building to provide to the fullest extent for the highest efficiency in the operation of its elevator cars. In such provisions lie not only the ordinary arrangements for securing the safety of passengers, but those for the prevention of any unnecessary delay, even of the shortest duration.

Telephone in Elevator Car to Be Used for Communication with the Engine Room in Cases of Emergency.

The managers of the building, in addition to providing special equipment of the highest grade to insure the safety of its passengers, have realized the advantage of providing a means for direct communication between the operator of each car and the attendant at the source of power. To attain this end each elevator has been equipped with a telephone. Each instrument is connected to a line led through the heavily insulated flexible cable which carries the ordinary signal and lighting wires to a distributing point, from which it runs to the engine room. At this point connection is made with an instrument in a location readily accessible to the engineer. The elevator system is entirely distinct from the private system for general use in the building, and in the details of construction the greatest care to prevent possible failure of service at a critical moment has been exercised. The instruments are of a compact type, employing a transmitter set within the face of the box enclosing the hook switch and induction coil, with only the mouth-piece protruding, and the receiver is of the ordinary bipolar type. The use of a battery call system, with vibrating bells contributes to the compactness of the set while at the same time it enables the car operator to call without the labor of turning a crank. The instrument is conveniently located on the wall of the car near the front, at the left hand side of the operator when he is standing at the usual position in front of the controller.

Occasions for the use of these instruments have been of extremely rare occurrence, although they have been installed ever since the elevators have been in operation. On such occasions as have brought about a temporary brief interruption of service, however, their value has been greatly appreciated, not only by the operators, but by the passengers. They have been of assistance to the engineer in the proper manipulation of his machinery, and have enabled passengers and operators to ascertain the extent of the difficulty, and so have been able to materially reduce the annoyance or apprehension that might otherwise exist owing to an interruption of service in such an extremely high shaft.

This instance of the extension of the telephone service to one

Digitized by Google

of the minor fields of passenger transportation is another illustration of the value attached to the maintenance of constant means of communication between the separate parts of such a system. The conception of the telephone as an instrument limited to services in fixed stations is fast disappearing, and it is likely that the time is near at hand when a man may be able to keep in constant communication with his home wherever he may be. The fact that he is riding rapidly across the country or moving upward will prove no barrier to the telephone, as the skill of our engineers is rapidly overcoming such obstacles.

Care and Maintenance of a Pneumatic Ticket Distributing System

By E. A. Hawkins.

A TOLL ticket containing the details of a call, as ascertained from the calling subscriber by the recording operator, denotes an unfulfilled contract. The ability of the operating company to fulfill that contract is dependent upon the facts stated on the toll ticket. It therefore follows that the security of that ticket must be closely guarded. From a description of the operation of a pneumatic ticket distributing system the point will arise that it seems like taking a great risk to entrust a toll ticket to such a system. Upon further consideration some alarm might exist as to the consequences in case the vacuum should be destroyed at a busy hour of the day. In such a case the data for several hundred connections would be lost temporarily in the various tubes of the system. Care and maintenance of such a system is therefore a subject of the very highest importance.

In all complicated systems the troubles that may be encountered are numerous. The more important ones are as follows:

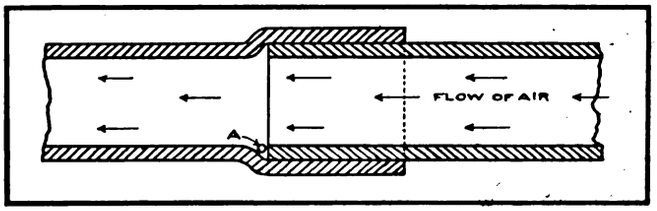

Fig. 1. Joint in tubes, showing method of avoiding interruption of passage of tickets.

1. *Tube system not in perfect condition before using.*

A very small obstruction in the interior of a ticket tube may interfere with the passage of tickets. The ticket tubes are made up in sections, about fourteen feet long and are fastened together by means of an expanded joint as shown in Fig. 1. In order to make the joints airtight they are soldered together. Great care must be exercised in the soldering. A small globule, as shown at A, might be readily forced in by the pressure of the gas flame used for this purpose.

All joints should be so made that the flow of air through them will be in the direction indicated by the arrow in Fig 1. Otherwise the ticket will become lodged against the edge of the inner tube. Sharp twists and bends must not be near together in the same runs. The ticket can then gain momentum on the straight portions of the runs before encountering such obstructions. After the system is fully installed the whole tube system should be "blown out" by reversing the direction of rotation of the exhaust, thus making it a positive pressure blower. This can be done either by crossing the belt or by reversing the connections of the motor which drives the exhauster. By this means all dust, dirt and other matter that may have collected in the tubes, will be removed through the open ends of the tubes. The entire system should be given a rigid test before any attempt is made to put it in service.

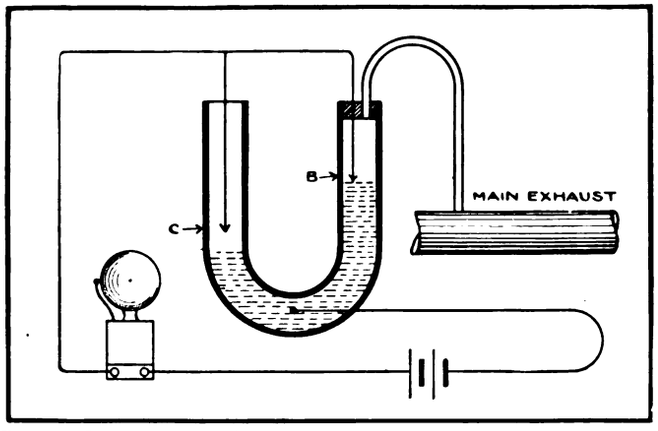

Fig. 2. Connections of alarm bell circuit to mercury vacuum gauge for calling wire chief's attention to change in pressure.

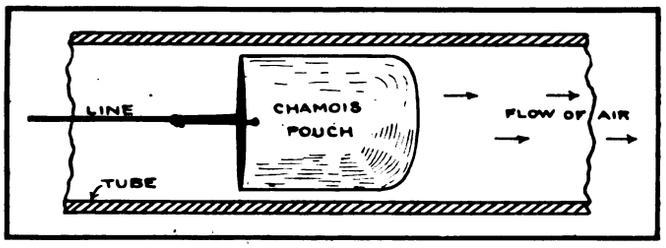

Fig. 3. Carrier for taking line through tube.

The more use a tube receives, the more perfect does its interior surface tube become. The continued rubbing of the tickets gives the inner walls of the tubes an exceedingly high polish. An uninterrupted stream of tickets run through the system for a few hours before the final test will contribute to its success.

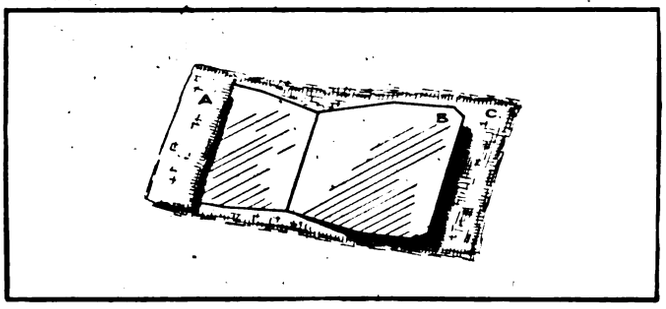

Fig. 4. Cleaner to be passed frequently through tube; A, flannel cover, folded; B, fibre support; C, end of flannel.

2. *Failure of power at the exhauster.*

If the system be of such size that in case of failure of the exhauster to keep up the required vacuum, it would be impossible to distribute the tickets by messengers during the time required for repairs, then there must be a duplicate set of exhausters provided. The exhauster is generally belt-driven by an electric motor. In the case of two exhausters and motor units the motors must be run from two entirely independent sources of power.

The motor capacity, the sizes of motor fuses and the overload feature of the motor speed regulator should be so ample that a sudden overload cannot put the system out of commission. The power board containing the motor controlling apparatus, and also the air gates at the individual exhausts, must be readily accessible. In case of accident to one unit it is thus possible for the attendant to quickly start the reserve unit.

3. *Variable vacuum in system.*

After a system has once been adjusted to a certain vacuum it is absolutely necesssary that the vacuum should not vary.

Digitized by Google

Otherwise the speed of tickets will be too high or too low for safe travel. Any desired vacuum can be obtained in the system by means of the variable resistance in the motor starter, assuming that a direct current source of power is used.

It is often necesssary to cut off the flow of air through a number of unused tubes after the busy hours have passed. This cannot be done by merely closing the cut-off valve at the various receiving points. By so doing the exhauster, if still running at a fixed speed, abstracts the same amount of air through the system. This exhaustion through a smaller number of tubes will produce a higher vacuum. In order to cut off a number of tubes it is necessary to make a change in the speed of the motor.

There should be two vacuum gauges for all systems; one, to be located at the power board for the use of the attendant, and the other in the toll operating room. The mercury column type of gauge can always be relied upon for accuracy and is therefore desirable for this purpose.

In case the vacuum is higher or lower than required by the safe limits of the system, an alarm must be sounded both in the operating and blower rooms. This will indicate to the operators that no more tickets are to be sent until a normal vacuum has been restored. This is indicated by the inactivity of the alarm bell. The attendant, on hearing the alarm, is required to instantly start up the reserve unit. Readjusting the speed of the unit that was in use may be all that is necesssary. An alarm of this nature can be made up from a "U" tube, as shown in Fig. 2. The positions of the electrodes B and C are adjustable. When contact between the mercury and electrode B is made, an excessively high vacuum is present. In a similar manner an excessively low vacuum would be indicated by a contact at C.

4. *Humidity.*

The amount of moisture in the atmosphere of an operating room plays an important part in the successful operation of a pneumatic distributing system. The moisture in the air passing through the tubes has a tendency to condense on the inner walls of the tubes and tends to interfere with the passage of the tickets. Although tickets can be passsed through tubes containing a considerable amount of moisture, yet the chance of trouble under such conditions is increased. It is therefore necessary that dry air be supplied to the operating room. In case this is inconvenient, care should be taken to see that no windows are open in the neighborhood of the recording or distributing tables.

5. *Dirt in Tubes.*

For the successful operation of the system a clean operating room is absolutely essential, since the air of the room is being continually drawn off through the ticket tubes and out through the exhaust. Thus any dust that may be contained in the air will be deposited in part on the inner walls of the tubes. Since it is impossible to keep the air perfectly clean, the interior of the tubes will become coated with dust. As the cleaning operation is laborious, it is desirable to keep the ends of the unused tubes plugged up. If a tube remains out of commission for some time, a solid plug must be inserted in its sending end. The cut-off valve at the receiving end must be also closed, thus shutting up the tube completely. These solid plugs are made of metal or of soft rubber. The latter are in favor, since they need not be fitted for any particular tube, as in the case of the metal plugs.

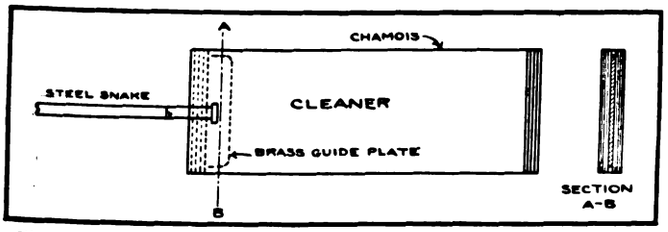

Fig. 5. Form of cleaner used for removing dust from tube at night.

It would be impossible to cut off the flow of air through a comparatively large number of tubes, as stated, without raising the vacuum on the system, unless the speed of the motor was varied proportionately. Therefor, when cutting off the flow of air for a short time through one or more of the tubes, preliminary to a general reduction in the total number of working tubes, because of a decrease in the calling rate, a screen plug is utilized. By this means the dirt is kept from entering the tubes and the vacuum is not varied.

There are two general methods of keeping the tubes free from dirt. One is to clean the tubes at one or two fixed periods of the day when the operation would least interfere with the working of the system. The second method is practically to keep the tubes from becoming dirty. This is accomplished by sending a cleaner through the tube every half hour or so. The form of cleaner used for this purpose is shown in Fig. 4.

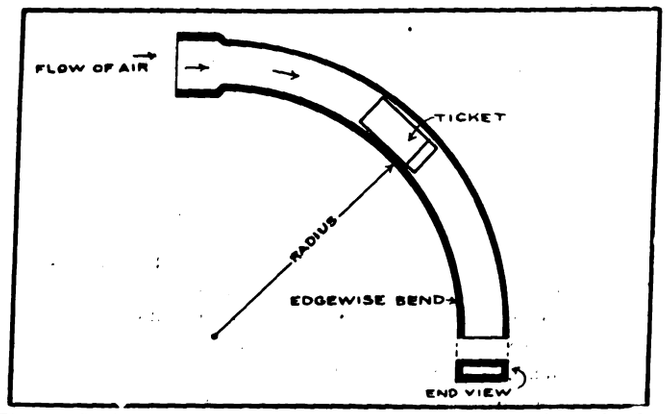

Fig. 6. Section of bend, illustrating proportions between width of tube and radius of curvature.

This cleaner consists of a piece of soft flannel cloth wrapped about a stiff fibre card, bent into the form shown in the illustration. It is propelled through the tube by the force of the air in the same manner as a ticket. When such a cleaner has become dirty after several passages, the cloth is turned.

For the method used in cleaning a tube less frequently there must be a man at both the sending and receiving ends. A carrier, consisting of a chamois pouch, as shown in Fig. 3, attached to the end of the strong line wound on a reel, is inserted in the sending end of the tube. This carrier is drawn through by the flow of air like a ticket. Upon the arrival of the carrier at the receiving valve, a heavier line is attached to the first line and pulled back through the tube by the man at the sending end. In case the tube run is long and has many bends and twists, a steel snake is pulled through in a similar manner. This heavy line or steel snake, as the case may be, is attached to the cleaner, a common form of which is shown in Fig. 5.

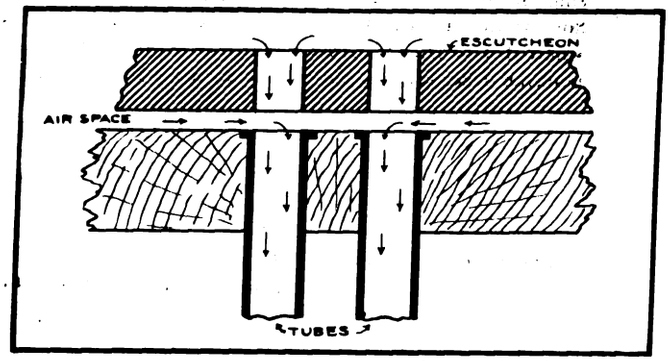

Fig. 7. Opening of tube, showing construction for reducing air pressure on ticket at moment of insertion.

This form of cleaner is made up of several layers of chamois. The cross sectional dimensions of this cleaner should be such as to just permit of its being squeezed into the end of the tube. The cut-off valve must be closed while the cleaner is being pulled through. The passage of the cleaner through the tube must be in the same direction as that of the tickets; namely, from sending to receiving ends.

In the case of a very dirty tube, which may have been out of commission for some time, a mixture of clean fine sand and talcum powder may be blown through the tube to cut the dirt,

Digitized by Google

but the after effects of this is such that its use is not recommended.

The number of times that such a cleaner must be drawn through is dependent upon the condition of the tube. Under normal conditions, one passage of a cleaner of this type is sufficient. The frequency with which the whole system of tubes is cleaned is entirely dependent upon the local conditions present at that exchange. If the tubes are cleaned in this manner once a day trouble on this account would be entirely eliminated.

6. *Accessibility of all tubes.*

It is essential that all tube runs be accessible throughout their entire length. If the tubes are run under false floors trap doors must be installed over all of them. If they are run in tube boxes, such boxes must be made up entirely of removable panels. Equal care must be exercised in laying out of tube run, as in the case of a cable run, so that the installation of additional tubes will not be prevented. The filling up or growth of tubes at the twists and bends should be such that it will be possible to remove any section of a tube run without it being necessary to remove the corresponding sections of adjoining tube runs.

7. *The size, style and weight of tickets.*

The operation of the best of systems would be unsuccessful if the ticket was not properly designed for it. The width of the ticket must bear a relation to the corresponding inside dimensions of the tube and also to the minimum radius of the edgewise bends as indicated in Fig. 6, otherwise the ticket will tend to stop at such bends. The flap of the ticket must be of sufficient length, so that it cannot be opened out by the force of the air. If a heavier ticket is used than that for which the system is designed, trouble will be experienced in the vertical runs and at the twists.

8. *Handling of tickets.*

The correct handling of tickets by the operators at the sending ends of the tubes is of much importance. There will be a strong flow of air into the tubes at the distributing and recording tables where the tubes are open ended. It is therefore necessary to hold the ticket between the fingers in such a manner that it will be impossible for the flap to open out the instant before it is inserted in the mouth of the tube. In order to eliminate the personal element in correctly placing the ticket in the tube, the flow of air over its mouth is reduced by means of a slight opening or air space between the actual ends of the tubes and the escutcheon over the tubes, as indicated in Fig. 7. The arrows represent the direction of the flow of air into the tubes. Considerable care must be exercised by the operators in inserting the tickets into the sending valves. When the valve is opened the flow of air at its mouth will likewise tend to open out the flap of the ticket. In order to get the full benefit of the pressure on the flap at the sending valves, the tickets must be inserted with their flaps projecting upwards.

9. *Adjustment of pressure on each tube.*

As previously pointed out, the pressure at the sending end of each tube can be regulated by means of the cut-off valves. After they have once been properly adjusted, and it is found necessary to either entirely close or open the same to clear trouble, care should be taken to see that they are readjusted to their proper position, as generally indicated by a set screw.

10. *Leaks in tubes and valves.*

The entire system must be free from leaks. A small leak in a tube will so reduce its vacuum that the pressure on the ticket will not be sufficient to pass it by the point of greatest resistance. If the leak is a bad one, there will not be a sufficient flow of air at the sending end of the tube to start the ticket. A leak in the seats of the sending valves on the common return tubes will cause similar trouble.

11. *Foreign material in tubes.*

It has been found by experience that operators will carelessly allow articles, such as pencils, pins, small pieces of paper, etc., to pass into the tubes. Since they materially affect the operation of the system it is necessary to maintain strict discipline in this respect.

(To be continued.)

The Problem in Resistance

The method of solving a problem in resistance by Prof. G. W. Wilder, of the Armour Institute of Technology, has brought out from our subscribers the following alternative methods of obtaining the desired results, which we take pleasure in publishing herewith.

SOLUTION BY A. F. POOLE.

IN looking over the article on "A Problem in Resistance," in the issue of THE AMERICAN TELEPHONE JOURNAL for Dec. 16, it seemed to the writer that the value of the required current could be obtained by a more direct method than either of those given by the writer of the paper. The method of approximation given in the second part of the article does not seem to him to be applicable to the particular case to which it has been applied. It is longer, if anything, than the first solution and misses the correct value by nearly 100 per cent. One is at a loss to see why this so-called method of approximation was given at all. It can apply only in the special case of the resistance r_5 being very large in comparison with the other resistances in the circuit. In the problem r_5 is only about 12% of the next higher resistance and naturally the method gave a result which was wide of the mark.

The problem is, given the various resistances R_1 R_2 R_3 R_4 R_5 connected in circuit as shown in Fig. 1 and the voltage between A and B, required the value of the current flowing in the path R_5 between C and D.

Let R_1, R_2, R_3, R_4 and R_5 be the resistance of the various branches of the mesh and C_1, C_2, C_3, C_4 and C_5 be the currents flowing in the corresponding branches. That is C_1 is the current flowing through R_1, C_2 that through R_2 and so on. Also let $V =$ the voltage between A and B.

At the point C the current flowing in is equal to the sum of the currents flowing out, so we may write

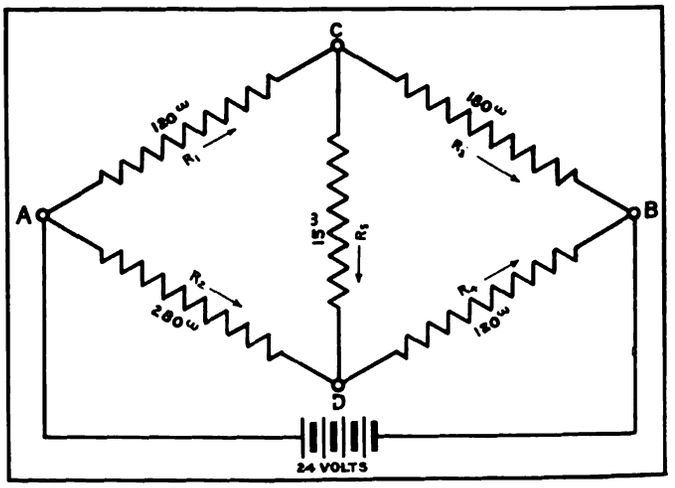

Fig. 1. Connections of battery and resistances.

$$C_1 = C_5 + C_3 \quad (1)$$

and similarly at the point D,

$$C_2 = C_4 - C_5 \quad (2)$$

Digitized by Google

Since the voltage equals the current strength multiplied by the resistance through which it flows we may write

$$C_1 R_1 + C_3 R_3 = V \quad (3)$$

$$\text{and } C_2 R_2 + C_4 R_4 = V \quad (4)$$

In the loop C D B the sum of the various electromotive forces must be zero, so we may write

$$C_3 R_3 + C_4 R_4 - C_5 R_5 = 0 \quad (5)$$

Substituting the value of C_1 given in (1) in (3) gives

$$C_3 = \frac{V - R_1 C_5}{R_1 + R_3} \quad (6)$$

Similar comparison of (2) and (4) gives

$$C_4 = \frac{V + R_2 C_5}{R_2 + R_4} \quad (7)$$

Substituting the values of C_3 and C_4, given in (6) and (7), in (5) gives

$$\frac{R_4 (V + R_2 C_5) - R_3 (V - R_1 C_5)}{R_2 + R_4} + C_5 R_5 = 0 \quad (8)$$

Solving (8) for C_5 gives

$$C_5 = \frac{V (R_2 R_3 - R_1 R_4)}{(R_1 + R_3) R_2 R_4 + (R_2 + R_4) R_1 R_3 + (R_1 + R_3)(R_2 + R_4) R_5} \quad (9)$$

In which by proper substitution C_5 may be found.

For this particular case it is easier to substitute the values in equation (8), $R_1 = 120$, $R_2 = 280$, $R_3 = 180$, $R_4 = 120$, $R_5 = 15$, $V = 24$. Substitution of these values gives

$$\frac{120 \times (24 + 280 C_5)}{400} - \frac{180 (24 - 120 C_5)}{300} + 15C = 0.$$

This reduces to

$$570 C_5 - 24 = 0$$

from which $C_5 = .0421$ amp.

This is the same result obtained by the first method of the paper under discussion with half the numerical labor.

Having this value of C_5 it is only necessary to substitute its value in equations (6) and (7) and add the results to obtain the total current flowing from B.

$$C_3 = \frac{24 - 120 \times .0421}{300} = .06316$$

$$C_4 = \frac{24 + 280 \times .0421}{400} = .08947$$

$C_3 + C_4$ = total current at A or B = .01526 Amp.

In order to check the computed value of C_5 a circuit containing

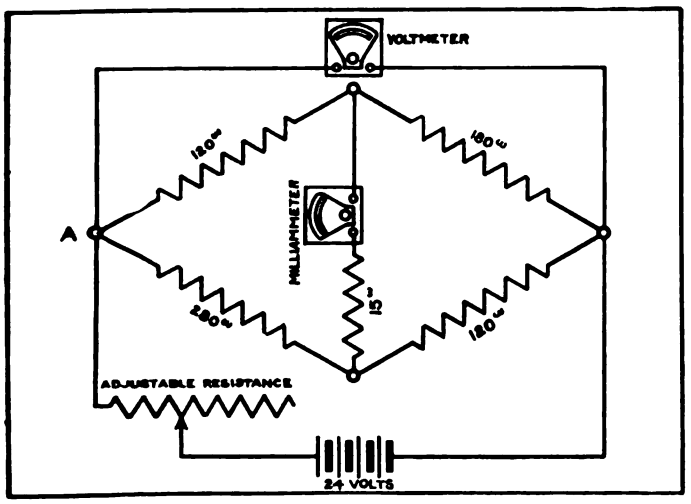

Fig. 2. Connections of voltmeter and milliameter for checking figures.

the various resistances and a voltmeter and milliammeter was arranged as in Fig. 2.

The ammeter used is one in which 150 milliamperes causes the needle to be deflected across the entire scale and it can be read to 0.0001 amp.

When the resistance was adjusted so that the voltmeter needle read 24 volts, the ammeter read 0.0425. This agrees with the computed value well within the limits of errors in the resistances composing the mesh.

Equations (8) and (9) are very useful ones; for example suppose it is required to find the current flowing in C_5, when it is connected to B, Fig. 3.

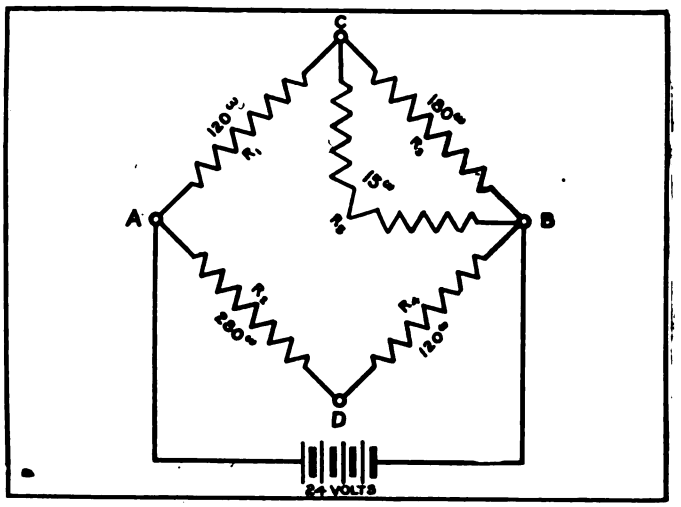

Fig. 3. Arrangement of connections for solution by special equation.

In this case R_4, or the resistance which corresponds to R_4 in Fig. 1, is zero. Take equation (9):

$$C_5 = \frac{V (R_2 R_3 - R_1 R_4)}{(R_1 + R_3) R_2 R_4 + (R_2 + R_4) R_1 R_3 + (R_1 + R_3)(R_2 + R_4) R_5}$$

make $R_4 = 0$.

Then all terms containing R_4 as a factor equal zero and the equation reduces to

$$C_5 = \frac{V R_3}{R_1 R_5 + R_1 + R_3}$$

an expression independent of R_2, as it should be.

From this equation (9) can also be obtained the proof of the principle of the Wheatstone bridge, for then $C_5 = 0$.

If $C_5 = 0$, the numerator of the fraction on the right side of equation (9) must equal zero, hence,

$$V (R_2 R_3 - R_1 R_4) = 0$$

$$\text{or, } R_1 R_4 = R_2 R_3$$

$$R_1 : R_2 :: R_3 : R_4$$

the familiar equation of the bridge.

In conclusion it seems as if the reported observation of "those who actually measured the current" that the value of the current in the branch C_5 was only 0.015 amperes is a case of either an error in experimenting or mistaken reporting. There is no need to account for the discrepancy between the observed and calculated values. There should be none if the observation and calculation are correctly made.

SOLUTION BY S. DUVAL, OF THE ECOLE NORMALE, JACQUES-CARTIER, MONTREAL.

SOME students might find it easier to work the problem of the unbalanced Wheatstone bridge in the following way: We may suppose that the branches AC and DB have been split so as to afford three independent paths for the current going from A to B. If we denote by c and d the voltage of points C and D, the voltage of B being 0, and that of A being 24 volts, we will have for the current in the different branches of Fig. 4.

$$\text{From C to B} \quad I_1 = \frac{c}{180}$$

$$\text{From A to D} \quad I_2 = \frac{24 - d}{280}$$

The current in the 15 ohm resistance connecting points C and

Digitized by Google

D will be that due to the difference in potential between these points, or

$$\text{From C to D} \quad I_3 = \frac{c-d}{15}$$

The total current from A to C will be $\frac{24-c}{120}$ but since this current is the sum of I_1 and I_3 we may write

$$\frac{24-C}{120} = \frac{C}{180} + \frac{c-d}{15}$$

From that equation we find $d = \frac{29}{24} C - 3$

The total current going from D to B is:

$$\frac{d}{120} = \frac{24-d}{280} + \frac{c-d}{15}$$

This equation gives $d = \frac{28}{33} C + \frac{12}{11}$

We now have two separate equations representing the value of d, and these may be equated to effect a determination of the value of the quantity C. On so doing it is found that

$$c = \frac{216}{19} \text{ volts.}$$

and solving for the values of other quantities we have:

$$d = \frac{204}{19} \text{ volts.}$$

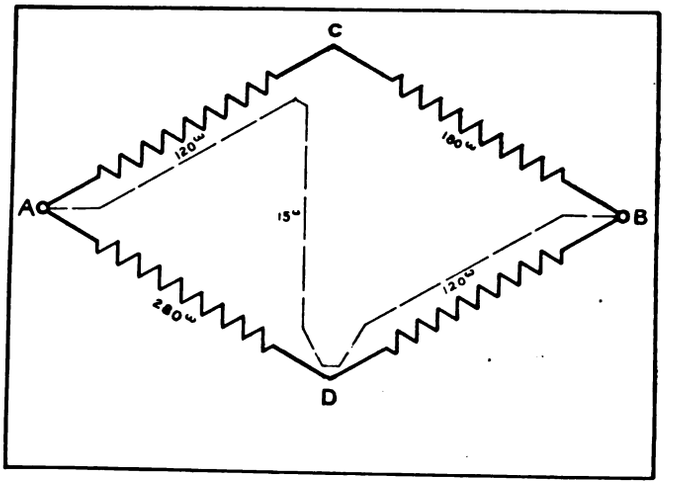

Fig. 4.

$$c - d = \frac{12}{19} \text{ volts.}$$

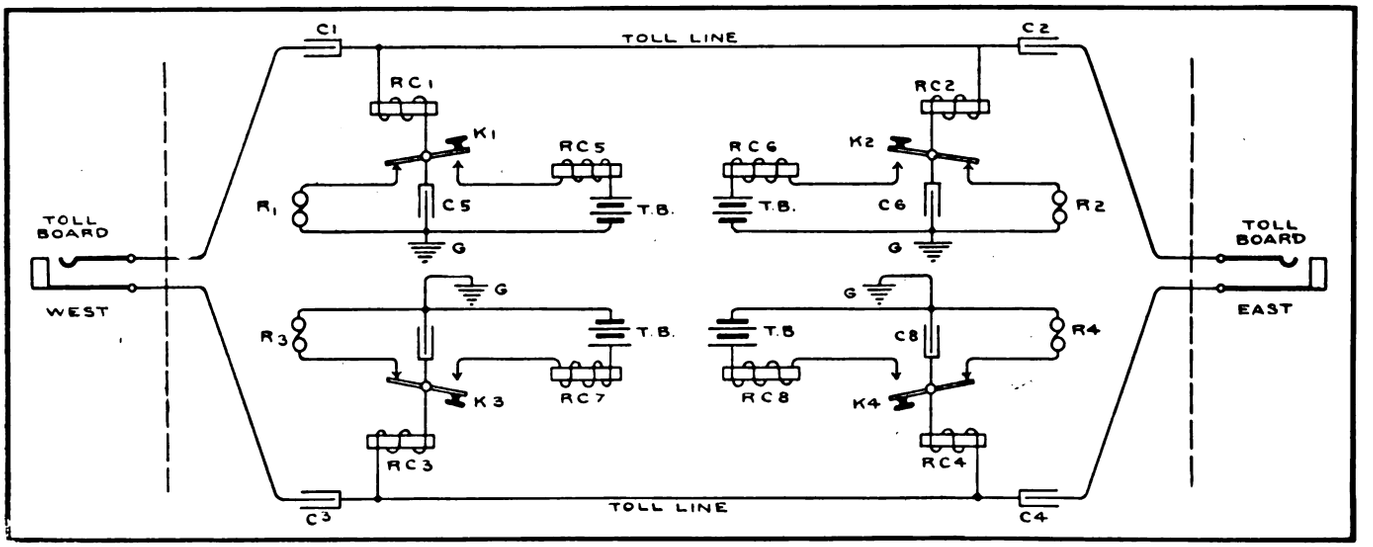
$$I_3 = \frac{4}{95} \text{ amperes} = 0.0421$$

Simultaneous Telephony and Telegraphy

By Louis Muhlheizler.

A CIRCUIT which ingeniously provides for the use of telegraph instruments upon a telephone line is shown in the accompanying illustration. In the figure C 1, C 2, C 3, C 4 are condensers, inserted one in each line wire, between the switchboard and the points where the telegraph instruments are connected. The ratardation coils R C 1, R C 2, R C 3, R C 4, in the telegraph line circuit are about 4½ inches long, with a core of battery, common to each of the four instruments, is used. The condensers in the battery circuit are shown at C 5, C 6, C 7, C 8. The effect of this combination of apparatus is to add to the capacity of the line for telephonic purposes two complete grounded telegraph lines, each provided with an instrument at each end for the sending of messages in either direction.

The retarding effect due to the electromagnetic inertia of the



Circuit Connections of Apparatus to Provide for the Simultaneous Use of a Metallic Circuit to Transmit Three Messages—One by Telephone and Two by Telegraph.

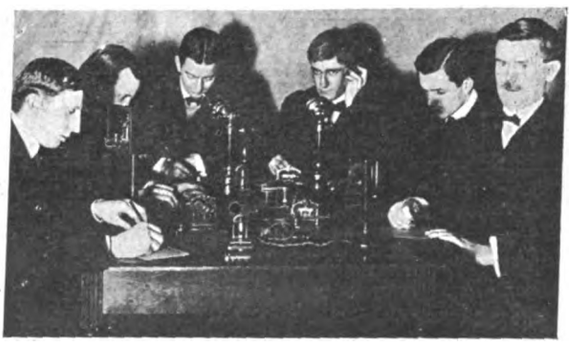
No. 24 soft iron wires ½ inch in diameter. Each coil is wound with No. 30 B. & S. wire, silk and cotton covered, to a resistance of 250 ohms. The retardation coils R C 5, R C 6, R C 7, R C 8, in the battery circuits of the respective telegraph sets are similarly constructed, except that their resistances are only 150 ohms each. The telegraph keys K 1, K 2, K 3, K 4 are of the double contact type, one side being opened at the time the key is depressed to close the other. Morse relays, shown at R 1, R 2, R 3, R 4, are each wound to 150 ohms resistance. A special 150 volt telegraph coils prevents the currents from either gaining or losing their strength suddenly, a gradual rise and fall in strength taking place instead. The condenser, which is charged at each closing of the key, and discharged to line at each opening, aids in checking the abruptness of the telegraph signals. Although each side of the toll line at each end is connected to ground through the telegraph circuit, the impedance of this apparatus is so high that no appreciable loss in transmission is noticeable. The ringing is also satisfactory, although in this connection it should be noted

Digitized by Google

that an ungrounded generator should be used. If this were not done ringing on the telephone line would cause the telegraph relays to flutter, temporarily interrupting any message being transmitted through these instruments. It is to be noted that a perfectly balanced line is secured, thus doing away with any possibility of the introduction of noise upon the telephone line.

Although this circuit must be very carefully maintained to prevent the occurrence of tree grounds or other leakage due to low insulation, it is believed to be as little affected by these troubles as a repeating coil simplex circuit. In wet weather the only difficulty noted is the necessity of occasionally adjusting a relay.

Although this circuit is not adapted to high speed telegraphic transmission, on account of the retarding effect of the various coils in the circuit, it possesses many features which make it valuable for use on toll lines of a length reaching up to 100 miles. It has been found to produce practically no interference with the use of the line for telephonic transmission, while it operates to produce a material increase in revenue.



Operators Using Telegraph and Telephone Apparatus on a Single Circuit of the Pittsburgh and Alleghany Telephone Company.

HOW WOULD YOU LIKE A TELEPHONE FREE? A NEW BELL GIFT WITH A STRING ATTACHED.

SPEAKING of philanthropy, the generosity of Carnegie with his library gifts and of Rockefeller with his donations to the Chicago University pale into insignificance when compared with the kindness of the Cumberland (Bell) Company in Louisville, Ky. All who live in less favored communities should study the facts in the case, for perchance some morning they may arise to find the hand of the giver has written his message of love for the people upon the front page of the local news sheet.

In Louisville is a newspaper, the *Courier-Journal,* which is ever on the alert to serve its patrons. Midnight oil is consumed by the barrel so that schemes for the good of the people may be hatched and carefully reared before being subjected to the piercing beams of the midday sun. There being no longer any war, either political or military, to assist the population in the use of their eyes and tongues, a brilliant idea crossed the minds of the powers that be. "Eureka," they said, "we have it! All that is needed to make our lot upon this earth one long dream of bliss is a Bell telephone in every home."

Now the Cumberland people had thought the same, but, alas, the gentle art of separating the public from its trust-like grasp upon the needed coin was not well understood by its simple agents. And besides there was a hustling competitor in the field who seemed to get more than his share of this same coin. Such a condition as this was intolerable, so the *Courier-Journal* people and the Cumberland Company got together and brooded over the matter. At last some one hit upon a brilliant idea. A fresh barrel of midnight oil was tapped and 'neath the fitful gleam of the lamps of genius a plan was perfected which in grandeur of design outdid anything ever before conceived in the Blue Grass State. Next day in bold array the magic words, "Have You a Telephone?" headed an advertisement in the *Courier-Journal* occupying a space about nine inches by six and a half, placed in a prominent position. The readers gazed in amazement at the question before they quite understood its import. Then continuing to read they were brought face to face with a second poser: "If not, how would you like one practically free?" Just think, no qualification as to social rank was necessary; the shoeblack or the washerwoman could stand on equal footing with the millionaire. Would they like one? Well, just guess! Some skeptical people were for going right up and getting two or three before the offer was withdrawn, but the more staid had a restraining influence upon the multitude until further particulars were learned. The next paragraph read as follows: "The *Courier-Journal* has closed a contract with a well-known and responsible Promotion Company, under the terms of which we can place in almost any residence in Louisville a Coin Receiving Bell Telephone at practically no expense for one year." Right away the feminine contingent of this paper's noble army of readers was subjected to severe pains near the region of the heart. "Almost any residence," so the advertisement read. Suppose it meant that any of their domiciles were without the magic area, that Mrs. Jones might be lucky and not Mrs. Smith. "Wouldn't it be just too awful for anything?" one fair dame was heard to say. The part that seemed to stick most of the natives was the "Coin Receiving" clause. Some thought it might be an automatic bank, while one of the rural readers declared it was a scheme whereby a wife could secrete any loose change she found in her husband's clothes. One or two there were who had misgivings as to the true meaning of the phrase, but they were laughed at, for did not the ad say in big type "practically free" in one place and "practically no expense" at another? No, that "coin receiving" might refer to a place to put the money that would otherwise have to be spent for telephoning, so that when it was opened at the end of the year the public could be agreeably surpirised with the money it had been saved by this wonderfully generous gift of the *Courier-Journal* and the Cumberland Bell.

To secure further particulars the reader was asked to fill in a blank and send it to the City Circulation Department. Oh, the wily Cumberland! So attractive a bait, such an irresistible lure it has devised. What advertisement of magic substance to be smeared upon the ugly angle worm to bring to the hook of the country youth untold thousands of fish can equal this! PRACTICALLY NO EXPENSE—for installation. Since when has a

SUPPLEMENT TO OFFICIAL BULLETIN NUMBER SEVEN OF THE NATIONAL-INTERSTATE TELEPHONE ASSOCIATION.

STATE REPRESENTATION—NEXT CONVENTION:

We wish to call the attention of the various State Associations to the necessity of electing delegates to the National-Interstate Convention to be held some time in June.

We also urge Independent interests in states at present having no Association, to organize as soon as possible, so that they may affiliate with the National-Interstate Association, and be represented at the convention. States organized but not yet members of the Association should do their full share in forwarding the Independent telephone movement by becoming members at once.

THE EDITOR'S PAGE

A MINOR WASTE.

IT is generally argued that in any business the needless duplication of labor is one of the principal sources of waste. The faults of management which operate to reduce the returns from a given investment may be broadly divided into two classes. Of these one may be said to include only the large errors, mistakes in judgment which are of infrequent occurrence, but which commit a concern to an unsuccessful policy, or involve it in operations which produce inadequate returns for the amount of money and effort expended. The other variety includes many things which in themselves may be considered trifling, but which are liable to be frequently repeated. In fact, this feature of repetition seems to be so characteristic of the faults of this minor class that all persons under whose observation they come grow so accustomed to their appearance that if not completely overlooked they are accepted as proper parts of the general system. In this way, as each causes a slight loss, the waste from every individual item is added to the mass piled up from those which have gone before, until at the end of the year a proper accounting would show a comparatively enormous sum. At this time, however, the management finds itself in the same position as the man who figures up how much money he would have saved if he had let alone his cigars, and nothing can be done. In an industry where one of the principal sources of expenditure is the cost of labor, the avoidance of all loss caused by the doing of unnecessary work is one of the most important conditions of success.

In telephone work a considerable portion of the labor expenditure is that for the keeping up of the plant, and of this, again, a very appreciable share is expended in the clearing of trouble.

Every telephone man familiar with the details of the work of the man who clears switchboard circuit troubles, or those which impair the working of the subscriber's line, can recall innumerable instances where a great deal of testing at distributing points has been necessary before a determination could be made of the wires composing the circuit in which the fault was to be found. It is an exceptionally well organized company, and one which may well compliment itself upon the efficiency of its equipment force, which has not many subscribers in thickly settled districts or large buildings who are familiar with the often repeated discussions of construction methods by maintenance men. In nearly every instance the cause is the same old grievance and the complaint takes the well-known form, "He just pulled in the wires any old way and you can't tell which one you want." And then the maintenance man tests them out, finds the one he wants and remembers its location from that time. If, however, he looks for a trouble on another line carried to that same group of terminals, or a new man is assigned to cover the district, the same process of searching and testing must be gone through, while the man loses his patience, the company its money, and the subscriber his service. This annoyance and delay would never occur if all circuits were pulled into terminals in the order of their numbers, and the numbers plainly marked to indicate this to be the case.

The points where a loss of valuable time occurs in a manner similar to this are numerous in many plants. Such a lack of order while generally avoided in as far as the subscribers' lines are concerned in the central office is known to occur with astonishing frequency at all minor terminal centers between the office and the subscribers' station. It is the more remarkable that this should be true since all lines and all cable conductors are assigned definite numbers and the question of the manner of designating the terminals of such wires is not open to doubt. In addition to the regular lines in every central office there are numerous circuits of a special nature where a complete and accurate designation scheme would lead to valuable results. The proper marking of all circuits is one of the most substantial aids to proper maintenance, and effects a saving in time which gives it a place amongst the important means of securing minor economies.

THE CONTROLLING INFLUENCE.

THE realization and acknowledgment by the public of the extent to which the telephone has made itself indispensable in the conducting of modern affairs are in recent times becoming commensurate with the real importance of the industry. Enterprising contract agents, in their efforts to keep equipment men moving at a lively pace by the addition of new business, have set forth long lists of the advantages of this method of communication for the accomplishment of the greatest variety of purposes. This catalogue seems to cover a range embracing nearly every phase of activity in the home and business affairs of every individual, from the ordering of the day's provisions in the morning through the details of the day's work to the arrangements for the pleasures of the evening. All extraordinary events also furnish instances of the superior utility of this marvelous means of communication. It lends itself with equal facility to the hasty summons of the physician, the transmission of the time-honored fanciful protest against the outrageous dimensions of his bill, and to the saving from the wicked grasp of the night-stalking burglar of the wherewithal for its payment. The contract agent has steadily urged his claims, and so skillfully have they been set forth, and so thoroughly have they been proved and borne out by common experience that the public has accepted them, and looks upon things from the same viewpoint.

The telephone is now largely in use not only as an agent for the accomplishment of numerous acts bearing on unrelated details, but as a means of unifying and controlling many isolated divisions of business enterprise. In the work of transportation it is used alike to control the movements of the great ocean steamship, the trolley car, and the steam railway train.

It is an example of this ability to overcome both time and distance that has recently called forth a striking editorial comment from one of our most prominent newspapers. Alluding to the remarkable condition of affairs existing in the stock market, the primary cause was stated to be the use of the telephone. Formerly general conditions demanded action along certain lines, and in so far as these conditions were understood by more or less isolated individuals, movements were initiated in the same direction. These movements, however, were likely to be spasmodic, varying greatly in intensity, and often much obscured by counter-currents set up around centres of different opinions or motives. To-day these minor agencies are constantly in touch with the powers that have placed themselves in the lead. The operations determined upon by the head are carried out simultaneously at innumerable points, and the knowledge of the effect of each step is almost instantly added to that from every other source of information, to assist in the further development of a well outlined single plan. From such a concentration of initiative and co-ordination of activity comes the immense power of the great modern trust. The ability of a huge corporation to rapidly grasp the significance of a situation, conceive a plan, and execute a movement depends upon the telephone.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. MCMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

REASONABLENESS OF REGULATIONS.

Our telephone company also does a general messenger business. We have a rule that our instruments shall not be used for calling messengers except from our own office. Another of our rules is that our telephones shall not be used for transmitting or delivering any message in respect of which any toll has been or is to be paid to any party other than the company. We have been having some controversies with subscribers over these rules and would like to know your opinion as to whether they are reasonable or not. R. C.

IT is the editor's opinion that the first rule you mentioned is unreasonable, as a general messenger business is quite distinct from the business of transmitting messages by telephone and is not necessary for the proper conduct of the telephone business. The latter regulation seems reasonable and would not interfere in any way with the regular occupation of your company in the transaction of a telephone business. For a case in point see People vs. Hudson River Telephone Co., 19 Abb. N. C. 406.

LIABILITY FOR DAMAGES BY LIGHTNING.

In the issue of THE AMERICAN TELEPHONE JOURNAL for January 6, under the heading of "Liability of Telephone Company for Injuries from Lightning," you call attention to certain cases on this subject. Another case on this same subject is that of Cumberland Telegraph and Telephone Company v. Martin's Administrator, decided by the Court of Appeals of Kentucky in 1903, and reported in 76 S. W. 394, also in 63 L. R. A. 469. I. L. A.

THE facts of the above cited case are as follows: Deceased took refuge from an electric storm under the porch of a store. He placed his back against an iron grating over a window and was subsequently killed by lightning which struck one of the defendant's telephone poles near the store and was conducted to the porch by a wire negligently maintained over the metal roof thereof, and from the roof to the iron grating, and thence to deceased. Held, that deceased was a bare licensee in the place where he was killed, and that defendant owed him no duty to properly maintain the wire.

DANGER OF CROSS TALK DID NOT JUSTIFY INJUNCTION.

AT Nacogdoches, Texas., the Russell Telephone Company, of Cushing, was caused to appear before Judge Berger and show cause why an injunction should not be issued restraining that company from operating a long distance telephone line from Cushing into Nacogdoches. The plaintiff in the case, the Texas Central Telephone Company, alleged that the competing line since it had been constructed would probably cause confusion over its line by "cross talk." Both sides were ably represented by counsel, and after the evidence had been introduced Judge Berger refused to issue the writ as prayed for.

VOID LICENSE TAXES IN MILWAUKEE.

THE city of Milwaukee is authorized by its charter to control and regulate its streets and under this supposed authority adopted an ordinance imposing an annual license tax on telephone companies operating lines on the streets as authorized by revised statutes of 1898, section 1778, granting all telephone companies the right to operate lines on the public highways on payment of one dollar for every pole maintained on the streets. The ordinance provided that the revenues derived from licenses should become a part of the general city fund. There was nothing to indicate that the license was for supervision and the aggregate amount sought to be collected greatly exceeded the balance of supervision. The court held that the provision of the charter was no authority for the city to exact a license from a telephone company, and that the ordinance was a revenue measure and void because not within the powers confirmed by the charter. Said the court: "Even if the city had the right to impose reasonable charges for inspection and supervision it should not be permitted under the guise of such power to collect large amounts of revenue for the benefit of the city, regardless of the amount necessary for such inspection and supervision and where the court can clearly see that revenue and not supervision is the aim and not the incident, and no power is given to license the occupation, the ordinance is void." Wisconsin Telephone Company vs. City of Milwaukee, 104 N. W. 1009.

TELEPHONE A HOUSEHOLD NECESSITY.

A TELEPHONE is a household necessity, just the same as sugar, or flour, or coal, and any eatables that are placed upon the table. The placing of the telephone upon the list of household necessities makes it mandatory upon the husband and the wife to pay for the same. This is according to a decree rendered in Justices' Court at Sterling, Ill. The Interstate Telephone Company brought suit against Mr. and Mrs. Perry Underhill to recover a certain amount of money due the company for telephone rental. The attorney for the defense maintained that the wife could not be a party to the suit, hence the suit was null. The Judge decided that the telephone is a household necessity, or as he described it, a "household expense." Therefore both husband and wife are liable for the debt incurred by the use of a telephone.

CITY CANNOT DISCRIMINATE BETWEEN COMPANIES IN ORDERING UNDERGROUND CONDUITS.

JUSTICE ANDREWS, at Syracuse, N. Y., has decided a telephone pole case from Carthage. It was the action of the Village of Carthage against the Central New York Telephone and Telegraph Company. The motion was to vacate a temporary injunction restraining the defendant from setting poles in the streets of Carthage and from attaching to any poles set since January 1 last anw cross arms or wires. The Carthage Board of Trustees had passed a resolution granting permission to maintain an exchange(but "by means of a conduit under the street only." However, in Carthage there is another telephone company which has an overhead system and the village did not compel that company to change to an underground system. Justice Andrews holds that it is well settled that a telephone corporation incorporated as the defendant has the right to use the public streets and highways of the State for its lines. This right is granted by the State, not by the city or village through which its lines may pass. It is also well settled that this right is subject to reasonable control by authorities of municipalities. This proposition is discussed at length. The complete control of streets is in the Legislature, and if the Legislature chooses to authorize their use for any public purposes, the consent of the municipality is not required. As the village of Carthage had assumed to require one company to put its wires underground in the same streets in which the other had open air construction, it is held to be an act that cannot be justified, even assuming that the matter is within its jurisdiction. So the injunction was vacated with costs.

IN THE OPERATING FIELD

MEETING OF FIFTH DISTRICT OF THE ILLINOIS INDEPENDENT TELEPHONE ASSOCIATION HELD AT PEORIA.

THE meeting of representatives of Independent telephone companies operating in the counties of Woodford, Peoria, Logan, Tazewell and Mason was held at Peoria on January 5 and 6. At this meeting consideration was given to the question of the adjustment of toll rates throughout the district and, incidentally, throughout the entire state. The plan as advanced by the toll rate committee, composed of J. S. Dailey of Chillicothe, James Barrett of Pekin and C. A. Camp of Sparland, is that the Independent companies throughout the fifth district unite on a uniform toll rate that shall obtain in all parts of the territory, and establish a clearing house, to be opened possibly in Peoria, from which the earnings will be distributed equitably among the lines participating in the carriage of a message.

Some fifty of the owners and managers of the systems radiating from Peoria attended the meeting and took part in the discussion of the question of merging their interests to bring about the best results. The toll rate committee was continued in service until the April meeting, with enlarged powers, the most important of which are the solicitation of toll connections in all parts of the state and in other and adjoining districts to join in the agreement and accept the articles which will be drawn up by the committee, the reception of whose report will be made the order of business at the next meeting of the association.

In the five counties mentioned, which compose the Fifth district of Illinois, are 30,000 telephones, which are connected up with 6,000 miles of toll lines. These telephones are owned by about sixty-five Independent companies, which operate in all 108 exchanges. Extensions and new toll lines are being planned which will materially increase the area capable of being reached by long distance messages from this region.

ATTICA, INDIANA, COMPANY IMPROVING ITS SYSTEM.

EXTENSIVE improvements are being made by the Attica, Ind., Telephone Company. To facilitate its toll business a new toll board is being installed to which will be connected a number of new circuits reaching out into the surrounding country. A line has been built to Riverside and will be extended to Independence. This will greatly facilitate the business conducted between the three towns, as heretofore the lines used passed through two towns en route. New poles are being secured and these will be used for reconstruction. Ultimately all the circuits will be changed over to full metallic and therefore every improvement being made at present is being done in a most substantial manner.

NEW INDEPENDENT COMPANY WILL BUILD LINES IN MAINE.

INDEPENDENT telephone service is being developed in the New England States in a manner which points to its gradual extension over the whole of this territory. In the state of Maine a very comprehensive system of toll and local service is being built up and new companies are constantly being formed. One of the latest is the Lewiston, Greene, and Monmouth Telephone Company. It is said to have planned to build and mantain a system which will operate in the following cities and towns: Auburn, Lewiston, Turner, Lisbon, Webster, Wales, Greene, Leeds, East Livermore and Livermore in Androscoggin county; Buckfield and Hartford in Oxford county, and Litchfield, West Gardiner, Gardiner, Monmouth, Farmingdale, Hallowell, Augusta, Manchester, Vassalboro, China, Sidney, Waterville, Oakland and Lewiston, Greene, Wales, Leeds, Readfield, Wayne and Winthrop in Kennebec county. The main toll routes are to be from Lewiston through Greene, Wales, Leeds and Monmouth to Winthrop; from Lewiston to Auburn; from Greent to Turner; to Buckfield and to Hartford; from Monmouth through Litchfield and West Gardiner to Manchester; from Winthrop through Manchester, Augusta, Sidney, Vassalboro and Waterville to Oakland; from Monmouth to Wayne and from Greene to Webster, and through all the other cities and towns above named.

The capital stock of the corporation is $10,000, of which $9,000 is common, with a par value of $10 a share. Among the list of stockholders are the following: Eli Hodgkins, of Greene; R. Alden, of Winthrop; H. M. Blake, of Monmouth; J. H. Gilman, of Monmouth; H. E. Merrill, of Monmouth; A. H. Bailey, of Winthrop, and H. E. Foster, of Winthrop. The officers of the corporation are: President, R. Alden, of Winthrop; treasurer, H. M. Blake, of Monmouth; directors, R. Alden, Eli Hodgkins, A. H. Bailey, H. M. Blake, J. H. Gilman and H. E. Foster.

KEYSTONE OF PHILADELPHIA SHOWS INCREASE IN EARNINGS.

IN the annual report of the Keystone Telephone Company of Philadelphia, read at the stockholders' meeting, the earnings of the company for the fiscal year ending Dec. 31, 1905, showed a substantial increase over those of the previous year. Gross earnings increased $64,795, and net earnings $18,588 over those of last year. A total of $639,370 was expended in extensions to the plant during the year. The total credit to profit and loss up to Dec. 31 was $292,578. There are 19,000 telephones in use and it is expected that 6,000 will be added during 1906. The company owns two hundred and seventy miles of conduit.

TRAIN COLLISION AVERTED BY USE OF THE TELEPHONE.

WHAT might have been a serious and costly wreck with loss of life on the Southern Indiana Railroad is reported to have been averted on January 10 by the thoughtful use of the telephone. The engineer of an eastbound freight train ran by a flag station. A westbound train with orders giving it the right-of-way was flying toward the incoming freight train. The agent at the flag station bethought himself of a farmhouse along the line that was connected with the station by telephone. He quickly called up the farmhouse, and requested that a messenger be sent immediately to flag the eastbound train. This was done just in time to prevent the coming together of the trains, which would almost inevitably have occurred within a few moments.

AN EXAMPLE OF RAPID INDEPENDENT DEVELOPMENT IN NEW YORK STATE.

THROUGHOUT New York State there are many Independent systems which furnish telephone service to a large proportion of the inhabitants. By a careful consideration of the needs of the communities in which they operate these companies have secured the lion's share of the business. An illustration of the progressiveness of Independent telephony is to be found in the Wellsville Telephone Company's exceptional growth.

Work was begun on the plant in the spring of 1901 and in the fall of the same year telephones were connected and service given. On the first day of January, 1902, seventy-five subscribers were receiving service.

By the end of that month twenty-five new parties were added

Digitized by Google

to the list. And so the growth continued until in 1903 a new 100 line section was added to the switchboard, and in August, 1905, the third section was installed. This position is devoted to trunk and rural line service, leaving the other two positions for the local lines There are at present fourteen rural lines terminating in the Wellsville exchange, and these connect with upwards of 150 subscribers in the surrounding country.

The long distance lines connect direct with all the important towns in the northwestern part of the State. Among the many towns which can be reached are Elmira, Binghamton, Syracuse, Auburn, Buffalo, Rochester, Jamestown, Warren, Erie, Titusville, Oil City, Kane, Bradford, and Hornellsville. At the present time there are over 600 subscribers who secure telephone service from this exchange. This number gives an average of one telephone to every nine inhabitants.

ILLUSTRATED LECTURES ON TELEPHONE TO BE GIVEN IN SOUTHERN STATES.

FRED T. LOFTIN, formerly press agent and correspondent for the Indianapolis Telephone Company and the New Long Distance Telephone Company, will go into the southern states and give lectures on the value of the telephone. Illustrations from stereopticon slides will be shown. Mr. Loftin's plan is to interest the people in communities where there are few telephones and instruct them how to organize local companies and build local systems. His lecture is void of technical terms and contains many features of great interest to the people who wish to learn the advantages derived from the use of the telephone in rural communities. The social features acquired in an isolated neighborhood, the value of market and weather reports, etc., are well brought out.

INTER-OCEAN COMPANY ISSUES NEW ADVERTISING FOLDER.

A MOST attractive folder has been issued by the Inter-Ocean Telephone and Telegraph Company of Buffalo, with a view to increasing public interest in its service. Upon the front cover is placed the Independent shield and the title "Independent Talks—Published for Your Benefit and Ours." The two inner pages and the back are reproduced upon this page. The paper is white, while the printing is in blue, excepting, of course, the shield, which is reproduced in the standard colors. As the quality of paper and typographical work are of the highest grade the leaflet is sure to make a good impression at first sight, and after that the pointed paragraphs within should in many cases produce the desired interest.

We want to convince you that Talking with us is the Cheapest Product in the World.

We are going to prove to you in Dollars and Cents that if you patronize us you are bound to get Results.

It will prove to you that as a Business getter it has no equal.

It is the quickest and best Salesman you can secure.

For a busy man it's a brain reliever.

We will show you that 500 miles is only a step.

We want to help you secure business and retain it.

You educate your customer. We will do the rest.

We believe you would pay the expense to secure their business.

We reach everywhere big and little.

We know everybody great or small.

We have no enemies.

Don't that speak well?

Our business is prompt, efficient and reasonable.

Get into the Habit.
USE THE
Independent Lines
and let us convince you
THAT THE
Inter Ocean Telephone and Telegraph Company
HAVE
Long Distance Service that is better than any
Other Company.

MERGER OF INDEPENDENT INTERESTS IN ILLINOIS PROVIDES FOR EXTENSION OF SERVICE.

BUSINESS men at Taylorsville and Pana, Ill., are much pleased with the recent merger of the two companies. The Home Telephone Company of Taylorsville has been negotiating for the Pana property for some time, as by its acquisition the local and toll service would be much improved. Morrisonville, Owaneca and Stonington are also included in the consolidation which will result in greatly improved service to the farmers and business men of the surrounding country. Stockholders in the Taylorsville Company are also interested in the Christian County Telephone Company, which is being rapidly developed.

ELEVATOR IN INDIANAPOLIS BUILDING PROVIDED WITH A TELEPHONE.

THERE is one elevator in Indianapolis provided with telephone connections. It is in the Van Vorhis block. The instrument is connected through wires in the cable used for the bells and lights, and is on a regular central office circuit. The object of the owner of the building, Flavius J. Van Vorhis, in having the instrument put in the elevator instead of in his office was for convenience in reaching the custodian and elevator man. The elevator runs to ten o'clock at night, and he can communicate with the men at all hours, no matter where he may be at the time. If the instrument were in the office it would not be available when the custodian was absent and the doors locked. The instrument was installed by the Indianapolis Telephone Company.

INDEPENDENT DEVELOPMENT IN ARIZONA BEING VIGOROUSLY ADVANCED.

NEW business and an increased demand for telephone service have been the causes of a rapid development of the property of the Consolidated Telephone Company in Arizona. At present a good deal of work is being done in the neighborhood of Tempe and also in Gila and Graham counties and in the Imperial valley. At Phoenix the company has 1,012 stations which are greatly used. A test was recently made of the number of calls made in twenty-four hours and the figures are interesting. From 8 p. m., December 26th, to 8 p. m., December 27th (twenty-four hours), 14,682 completed connections were made. This number does not include the attempts to secure a number or the times a line was found to be in use. The average time on the same date to secure a connection was 5¼ seconds. The company is putting in operation plans for keeping its service at a high standard of efficiency, and extending its lines with a view of furnishing a comprehensive and satisfactory service to this whole region.

SECOND CONVENTION OF VERMONT AND NEW HAMPSHIRE INDEPENDENT TELEPHONE ASSOCIATION.

THE Independent telephone men of Vermont and New Hampshire met on January 16th in Woodsville, N. H. There were over forty persons present. The organization is progressing rapidly, on a good firm basis, and much interest was shown. Several new members joined the association at the time of this convention. The principal business before this meeting was the adoption of by-laws, and other conventions will follow to complete the organization and map out plans for future development.

QUERIES

METHOD OF LOCATING CROSS BEYOND BRIDGED BELL.—(649.)

Will you kindly enlighten me through the Queries and Answers of your journal, of which I am a subscriber, as to the formula for obtaining a reckoning of the distance beyond an office which is closed for the night, at which a 1,000 ohm bell is bridged across the line, of a solid and permanent no resistance cross, such as would be caused by breaking a transposition glass allowing wires to cross at an unknown point beyond the bell and to which the testing station was unable to obtain a pair of test wires around behind the cross?

For instance, testing station A, where galvanometer is located, finds himself unable to ring station C, and station B being closed for the night is unable to cut the pair through for test at B. However, from previous knowledge he knows that there is a 1,000 ohm bell across the line at B, and has C to open the pair preparatory to a measurement and calculation by the distance table and wire gauge which is a matter of previous record. For convenience use calculation of 10 ohms per mile per pair, allowing distance of 50 miles from testing station A to closed station B. J. T. E.

Let us assume that the bridge at A shows a reading of 700 ohms. Under these circumstances deducting the wire resistance between A and B, or 500 ohms, we know that were the bridge measurement taken at B, the reading would be 200 ohms. This 200 ohms, called known resistance, must consist of 1,000 ohms shunted by an unknown resistance. To find this unknown resistance multiply the known resistance by the resistance of the bell and divide the product by the difference between the resistance of the bell and the known resistance.

For the above example:

$$\frac{1{,}000 \times 200}{1{,}000 - 200} = \frac{200{,}000}{800} = 250.$$

With wire at 10 ohms to the mile circuit resistance, this would give the fault as 25 miles beyond station B.

It would be perfectly possible to continue this process if there were more closed stations between A and C placed at known distances. We would simply take the result obtained by correction for the first bell as above described and use it as a basis to correct for the second bell, by repetition of the above process.

The case of locating crosses on a long line with bridged bells, of which the above is a sample, may well deserve the more serious attention of wire chiefs, as it occurs very often in actual practice, and in few cases do the wire chiefs attempt to make locations, being afraid of the calculations involved. This matter is not, however, as difficult as it might at first appear.

If a record is made up of each line, giving the loop cross resistance at each bridged station, no calculation is necessary, since, if we subtract from the measured value of the cross, the loop

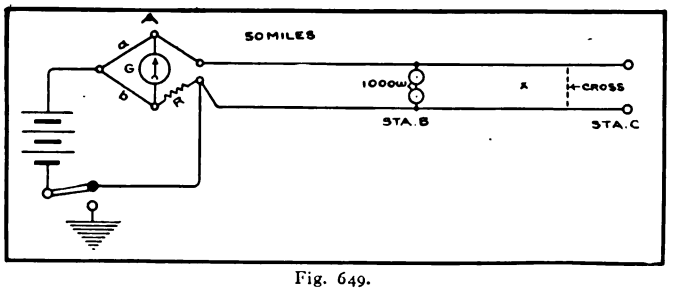

Fig. 649.

cross resistance of the station which is next lower in value, the difference in ohms may be figured directly from wire resistance into miles beyond that station. It will be seen that the opening of the line at the far end is totally unnecessary, since, if the line were loop-crossed the opening and closing of the far end would not affect the bridge reading.

Should it be inconvenient to obtain measurements of loop-cross readings at the various stations, these may be readily computed in the following manner:

Let d=wire resistance to first station.
Let d_1=wire resistance between first and second station.
Let d_2=wire resistance between second and third station.
Let m=resistance of bells.
Then d=loop cross resistance of first station, and

$$d + \frac{d_1 m}{d_1 + m} = \text{loop cross resistance of second station} = p;$$

and $$p + \frac{d_2 m}{d_2 + m} = \text{loop cross resistance of third station, etc.}$$

By continuing the process the loop cross resistance of any station may be obtained.

RESISTANCE PROBLEM.—(650.)

In the circuit represented in the accompanying diagram I should be pleased to have you give me a solution of the following questions:

1. What is the resistance of the circuit from *a* to B?
2. What current will flow in D and C respectively? J. A. S.

In reply to your first question the resistance of the entire circuit from one battery terminal to the other, neglecting the resistance of connecting wires, is obtained by adding to the joint resistance of the two parallel branches C and D the single re-

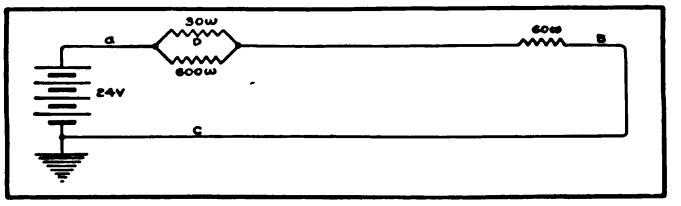

Fig. 650.

sistance 60 ohms connected in series. The joint resistance of the two paths is determined by the well-known formula $R = \frac{r^1 r}{r^1 + r}$

Substituting the values given we have $R = \frac{30 \times 600}{630}$, which gives a value of 28.57+ ohms. Adding to this the third resistance we have as the total resistance of the circuit 88.57 ohms. The current flowing in the circuit will be equal to the electromotive force of the battery, 24 volts, divided by this resistance, giving a value of .27+ ampere. This current will divide in the branch circuit in inverse proportion to the resistances of the separate members of this circuit. That is to say the current passing through the branch of smaller resistance will be twenty times as great as that in the higher. Therefore, as twenty parts pass through the smaller resistance, and one through the larger, the actual value of the current in the 600 ohm branch will be $\frac{.27}{21}+$ ampere, or .0128 ampere, while the current in the 30 ohms branch will be twenty times as great, or .256+ ampere.

BATTERY DEPOLARIZATION.—(651.)

Will you kindly answer the following queries concerning the depolarization of cells of a certain type of wet battery?

1. What benefit is derived from the manganese dioxide being inside of the carbon cup?
2. To what extent does the manganese dioxide assist in the depolarization? H. H.

In such a type of cell the manganese dioxide is mixed with hard granular carbon; therefore the negative electrode is composed of both the carbon that forms the cup and the granular carbon inside of the cup, the latter being considerably in excess of the former. Since a cup of this type is made of very porous carbon, the depolarization takes place in the same manner as with

Digitized by Google

those cells in which the cup is made up of porcelain or clay.

When the circuit including the battery is closed a chemical action takes place by virtue of which the zinc combines with the chlorine of the sal-ammoniac, simultaneously releasing hydrogen and ammonia. The latter gas dissolves in the water until no more can be absorbed, after which it escapes into the air. The hydrogen, by electrical attraction, is caused to penetrate the inner vessel, where it comes in contact with the manganic oxide. This it deprives of its oxygen, forming water and sesqui-oxide of manganese. The entire action may be represented by the chemical equation,

$$Zn + 2NH_4Cl + 2MNO_2 = ZnCl_2 + 2NH_3 + H_2O + Mn_2O_3.$$

As polarization is due to the presence of hydrogen upon the negative electrode, it takes place when the amount of hydrogen liberated is given off at a faster rate than the manganic oxide can be decomposed.

The carbon is supposed to contribute to the intensity of the action by which the manganic oxide is decomposed without undergoing any chemical change itself, in a manner which is not thoroughly understood. The depolarization of the exterior carbon of the cup is assisted by the movement of the liquid in the jar, which brushes away the hydrogen bubbles from the surface of the carbon. With the removal of the hydrogen counter electro-motive force, or polarization, due to its presence disappears.

HOW WOULD YOU LIKE A TELEPHONE FREE? A NEW BELL GIFT WITH A STRING ATTACHED.

(*Continued from page 59.*)

company charged for installation? And this comes from the Cumberland—the company whose boast it is that it fears no competition. It must indeed at last be driven to desperate straits. In Louisville the Independents have triumphed beyond all the dreams of their associates. Their competitor dares not show his face. The Cumberland is driven to the last stage of flight—where like the foolish ostrich it hides its face, and can find no better concealment than a flimsy paper mask.

TELEPHONE COMMUNICATION IN BEDFORD COUNTY, VIRGINIA.

By William R. Tyree.

BEDFORD COUNTY, Virginia, is yet in its infancy in the construction and operation of county telephone lines, there having been heretofore little local interest and less local capital invested in this well-paying enterprise. However, during the past two or three years there has been a general awakening in this great civilizing feature for all classes, and along this valuable line of progress for a class of people throughout a large and prosperous county. This, like other sections of the State, is becoming more and more dependent upon the county telephone.

At present the county is served by two companies still in an embryo state, one operating north, and one south of the Norfolk & Western Railway Company's tracks, running from east to west, which divide the county of Bedford, so far as these two separate lines are concerned, into two separate and distinct districts. Both of these lines run their wires into Bedford City—a town of three thousand population—the county seat of Bedford County.

The Bedford Southside Telephone & Telegraph Coporation was chartered in the year 1904 with A. J. Gillaspie as President; Dr. S. H. Price, Vice-President, and T. W. Richardson, Secretary and Treasurer. Its object is to gradually extend its lines throughout the entire southern section of the county; to have a common switchboard connection in Bedford City with the Municipal and Northside Company, which will, likewise, give it a connection over the whole State; to increase the number of its telephones, and the extent of its wire mileage.

At prsent the Southside company has only one telephone in Bedford City. From it a metallic circuit line runs directly south to Gillaspie, thence to Pollard and toward the Campbell County border, embracing in all twenty-nine miles of wire and twenty-four telephones. These rent for $1 per month for residence and $1.50 for merchants, bringing in a revenue of $360 per year.

On the other hand, the Big Island & Bedford City Telephone Company, whose operating field extends entirely into the northern part of Bedford County, has a slight advantage in operation, it having been constructed at an earlier date than the Southside company. Its charter was granted in 1903 by the Virginia State Corporation Commission. The officers and board of directors of the Big Island & Bedford City Telephone Company have been chosen from men most in touch with local capital and local business interests of the county. Dr. E. L. Marshall of Big Island, Va., is President; C. F. Logan of Big Island, Va., Vice-President, and D. H. Scott, Secretary and Treasurer, while upon the board of directors are R. S. Turpin, R. Goff, Dr. S. J. Gill, A. M. Trumbo, W. S. Perrow, R. R. Logwood, and A. J. Wheat.

The object of this line, under its charter, like that of the Southside company, is to, in time, extend its wires, in direct and branch lines, through the entire northern section of the county.

As the telephone world can readily see, there still is much room for development in telephonic communication in Bedford County, but that the start has been made is a certainty, and in a few years we may expect that these lines, now so entirely separated from one another, will run into a common switchboard—located at Bedford City—and thus give its residents facilities for placing themselves in telephonic communication with every section of Virginia.

MEETING OF NORTHWESTERN CEDARMEN'S ASSOCIATION.

ON January 9 the tenth annual meeting of the Northwestern Cedarmen's Association was held in Minneapolis. The meeting was well attended, and the amount of business handled and the reports read showed that many important benefits had been due to the organization, and employment of a permanent secretary during the past year. In the report of Secretary M. O. Nelson was a statement of the sales for 1904, which make up a total of 603,000 seven-foot to eighteen-foot posts, and 290,000 poles in lengths of 20 feet and upwards.

It was quite evident that the cedarmen are anxious to obtain information of this nature, and are willing to co-operate in its collection, since 74 responses to requests for reports of sales for 1904 were received, and to that for stocks for 1905, 63 responses, and to that for dry stocks on hand January 1, 50 responses. In addition to this, it was stated that 50 wholesalers sent in their replies within a single week.

The plan whereby the estimate of posts and poles put in the current winter was obtained, is one suggested at the last April meeting, and discussed previous to that time by the association. This is to divide the cedar-producing territory into districts, giving to some wholesaler, who is familiar with that district, the task of estimating the cut of the winter there and the cut of the previous year. This obviates the overlapping of estimates and covers all the territory, though in a rough way. These estimates are based on average logging weather. Last year the estimate was made up from reports of individuals, each operator giving a report of his own cut only. In the report at the end of the logging season the secretary is ready to use either or both methods, as the association may think best.

Reports of various committees dealing with matters of broad interest to the association were read, and, in accordance with a recommendation of a nominating committee, officers were elected as follows:

President, Marshall H. Coolidge; vice-president, P. W. Raber; treasurer, W. B. Thomas; directors for three years, A. T. Naugle and W. T. Watkins.

APPROPRIATING WIRES.

AT Hopkinsville, Ky., A. B. Johnson sues for $2,000 damages from the Ideal Construction Company and the Hopkinsville Home Telephone Company, alleging that last May they cut and appropriated wires which belonged to a private telephone system which had been constructed in his neighborhood.

TELEPHONE PATENTS

TELEPHONE.

Charles G. Burke, Brooklyn, N. Y., patents (No. 809,423; dated Jan. 9, 1906; filed Sept. 16, 1901; serial No. 75,434, and assigns one-half to John Q. A. Whittemore, Boston, Mass.), a telephone receiver.

The novel feature of this device lies in the coil windings of the magnet. Of these there are two, one of fine wire wound next to the core, and the other of coarse wire laid over the first. In this way an induction coil is formed which the inventor states is shown by his experience to aid in increasing the loudness and clearness of the reproduced speech. The two windings are brought out to four binding posts. The inventor claims that by the use of two receivers, one being of the ordinary type, additional advantages are secured. A diagram showing connections is included.

The second receiver when used is to be connected between one terminal of the primary winding and one secondary terminal. The two sides of the metallic line are to be connected one to the remaining terminal of the primary winding and one to the free terminal of the secondary, respectively.

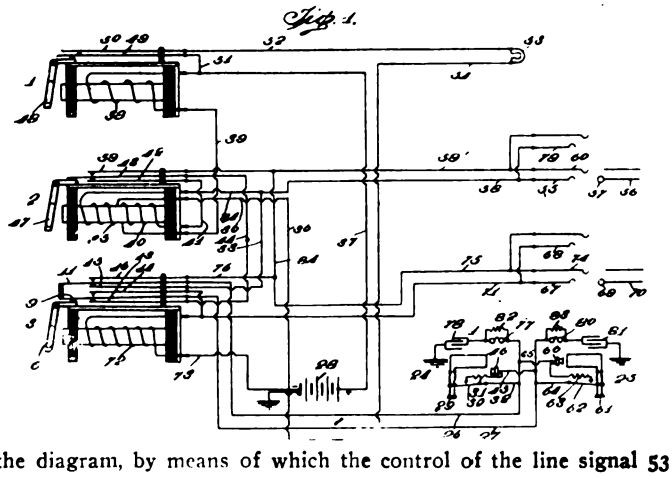
TELEPHONE SYSTEM.

Robert H. Polk, Birmingham, Alabama, patents (No. 807,316; dated Dec. 12, 1905; filed Jan. 19, 1904; serial No. 189,693) a telephone system.

The object of this invention is to provide two parties on a metallic line with individual ringing circuits. Besides the usual line relay, *1*, there are two auxiliary relays, *2*, *3*. The circuit is complex, but the following explanation will assist in the understanding of its operation. Relay *3* has six contact springs, two of which *9* and *11* can be made to open and close circuits by movement of the relay armature *6* in a similar manner to a regular type key.

Relay *2* is differentially wound. Its use will be stated later. Each of the two parties on a line has an individual multiple jack; station 24 utilizing 67, 68, and station 25, jacks 79, 55.

When either station calls the exchange, a circuit is formed through relay contacts, battery, and relay windings as indicated in



the diagram, by means of which the control of the line signal 53 is effected. To call station 24, for example, the operator plugs into jack 67 or its multiple, 68, and puts positive battery on wire 71, which traverses winding 72 of relay 3 back to negative battery. Armature 6 is attracted and contacts 13, 9 and 15, 11 are broken, while contacts 9, 14, and 11, 16 are closed. Alternating current is then applied to the sleeve circuit 75, which traverses contacts 16, 11 of relay 3 wire 26, bell and condenser of instrument 24, to ground.

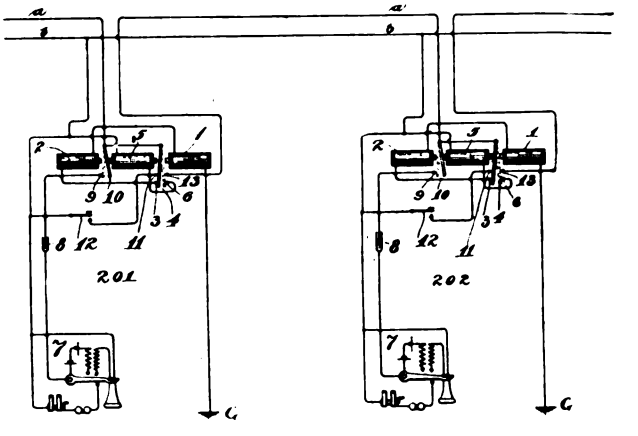
To signal station 25, the operator plugs into multiple jack 79 and positive current then flows from the tip 57 over wire 58, wire 34, winding 35, back to negative battery. Relay 2 is then energized and closes contacts 43, 59. The operator then sends alternating current over wire 59, which traverses contacts 59, 43, wire 44, contacts 13, 9, line 27, bell and condenser of station 25.

Impedance coils of approximately 250 ohms. are suggested by the inventor to bridge the bell coils. Their object is to provide a shunt path for the condenser discharge which occurs when a receiver is removed from the hook of another telephone, this discharge being an annoyance on account of its causing a momentary tap of the ringer gongs. The effect of these impedance coils upon the ringing of the bells which they shunt is not stated in the patent.

PARTY LINE SYSTEM.

Arthur F. Poole and Frank B. Hall, Wheeling, W. Va., patent (No. 810,346; dated Jan. 16, 1906; filed Oct. 13, 1902; serial No. 127,114) a party line signalling system.

This patent discloses means for selectively signalling a party on



a party line and for a party to signal the exchange. Referring to the illustration the line wire *b* is legged to all stations, but the line wire *a* is looped into each in such a manner as to be normally open between any two stations. This will be understood by tracing the circuit. At station 201 the circuit from wire *a* passes through armature 4 of magnet 5, through windings of magnets 2 and 1 to ground. The continuation of *a* to station 202 is broken at contact 13, station 201. In signalling a subscriber the operator by selective mechanism at the exchange closes the open contacts of the line *a* up to the desired station. In calling the exchange a subscriber closes key 12, which completes a circuit from wire *b* through coils of magnets 2 and 1 to ground, thus signalling the exchange. The subsequent operation of the system depending upon the manipulations of the exchange apparatus which is too complex to describe herewith, owing to the necessity of referring to numerous numbered drawings, we would suggest that parties interested procure a copy of this patent. Numerous claims covering the principles of operation at the central office and at the substations are included in the patent.

WRITE FOR OUR CATALOGUE

GRAY TELEPHONE PAY STATION CO. HARTFORD. CONN.

FOR SALE

Advertisements under this head, $1.00 for 25 words or less for each insertion. Prepaid.

FOR SALE, CHEAP—600 pairs self-soldering protectors. Also one 300 pair and one 500 pair main distributing frame, used less than two months. Will sell separately or together. Address Virden Telephone Exchange, Virden, Ill., or Girard Telephone Exchange, Girard, Ill. 420

FOR SALE—Best proposition in Indiana. Plant 200 subscribers, 150 miles rural construction, thirty-six miles toll line, connection both telephones, new board, and all new construction in town. American Electric telephones. Located near large oil fields. Will sell all or half interest. A bargain. Address Box 531, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 531

FOR SALE—February 1st we will cut over the central energy and will sell all or a part of the following: Kellogg Magneto Express Switchboard, Lamp Transfers, Seven Positions, 150 numbers each; Kellogg Iron Distributing Frame, capacity 1,250 numbers, with 900 arresters installed; Holtzer-Cabot, Direct Connected Motor Generator, Charging Machine; Holtzer-Cabot Direct Connected Motor Generator, Ringing Machine; Four Cells, No. E-9 Chloride Accumulators, Marble Power Board, 900 Magneto Telephones. This apparatus is practically new, and at present in operation, giving good service. It can be seen and examined by parties interested. Address Lynchburg Telephone Company, S. H. D. Freed, Manager, Lynchburg, Va. 517

SUPPLIES WANTED

WANTED—Eight second hand magneto telephones in good working order. State price and make, and how long in use. Address Box 511, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 511

WANTED

"Help Wanted" or "Position Wanted."—Advertisements under this head 25 cents for 25 words or less for each insertion. Set in bold face type $1.00 per insertion for 25 words or less.

WANTED—Traveling salesman, calling on the telephone trade, who can sell an article used by every large telephone company. Address Box 519, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 519

WANTED—Position as manager and lineman with company of 200 or 300 telephones. Have had five years' experience and can give A1 references. Am married, steady and sober. Address Box 483, Story Co., Collins, Iowa. 528

WANTED—Continued.

DRAUGHTSMEN—Large Eastern telephone company requires several young draughtsmen who letter well, as tracers and designers on circuit, map, equipment, cable and general draughting. State age, education, experience and salary expected. Enclose a sample of your free hand lettering and of your draughting. Address Box 527, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 527

THE best resolution a man can start the New Year with, is to secure the position for which he is best adapted. Our business is to help you find that place. We may now have it among the thousands on file at the various offices in the larger cities. If your name is not listed with us, it should be. Write us for information to-day. HAPGOODS, Suite 511, 309 Broadway, New York City. 464

WANTED—Position as manager of common battery exchange. Practical telephone and good business man. Have good record. Would not consider less than $100 per month. Address Box 526, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 526

WANTED—A manager. First class opportunity for right man. Give references, state age, experience and salary expected. Address Box 529, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 529

WANTED—Position as manager. I am not a technical man but a thorough business man; understand construction work in every detail, know what business is and how to get it; a master of details, quick and accurate in emergencies; thorough in system and discipline. Can "make good" in any position of responsibility where energy, fidelity and brains are needed and appreciated. Let me give you my experience and references. Address Box 533, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 533

WANTED—Man competent to manage five telephone exchanges, having 3,600 telephones in service, with headquarters in Kansas City. State experience and references. Address Kansas City Home Telephone Company, Kansas City, Mo. 534

WANTED—Experienced telephone men of good appearance and address as traveling inspectors for the Engineering Department. We need men to fill vacancies caused by recent promotions. Address George J. Yundt, Engineer, Southern Bell Telephone & Telegraph Company, Atlanta, Ga. 530

WANTED—Position as manager. Have had experience from the ground up. At present manager of an exchange of 1,000 subscribers, but desire a change. Good references. Address Box 532, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 532

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

INTERIOR SYSTEM TELEPHONES.

THE S. H. Couch Company, Inc., of Boston, has met with such success with its interior apparatus that it has been obliged to enlarge its present factory in order to meet the increased demand for apparatus of this type. The few working parts and the positive contacts in these telephones are said to have contributed much to their popularity, and the following cuts and description will give some idea as to their simple construction.

In Fig. 1 is shown the general arrangement of the wall set. It is stated by the manufacturers that as there are no floating contact springs, all springs being under tension at all times, they cannot get out of adjustment. When a button is depressed the spring connecting with the talking circuit, which is common to all sets of springs, makes a contact with the line spring and forces it down until it makes contact with the ringing bar. When the pressure is removed these springs leave the ringing bar, but are held in contact with each other by the catch plate. When the receiver is replaced, or another button is pressed, the button springs resume their normal position.

The arrangement of the interior of the wall set is shown in Fig. 2. Every working part, as well as all connections, are exposed the instant the box is open. The buttons and surface contacts of all working parts are of metal, thus doing away with hard rubber or composition, which is so likely to expand and become sticky. The battery and line wires enter through a hole in the lower part of the base, connecting directly to the line springs. As there is a space under the switch mechanism plenty of slack wire can be left in the instrument, which is a very desirable feature when the cables are run on the exterior of the walls in rooms where this method of wiring is permitted.

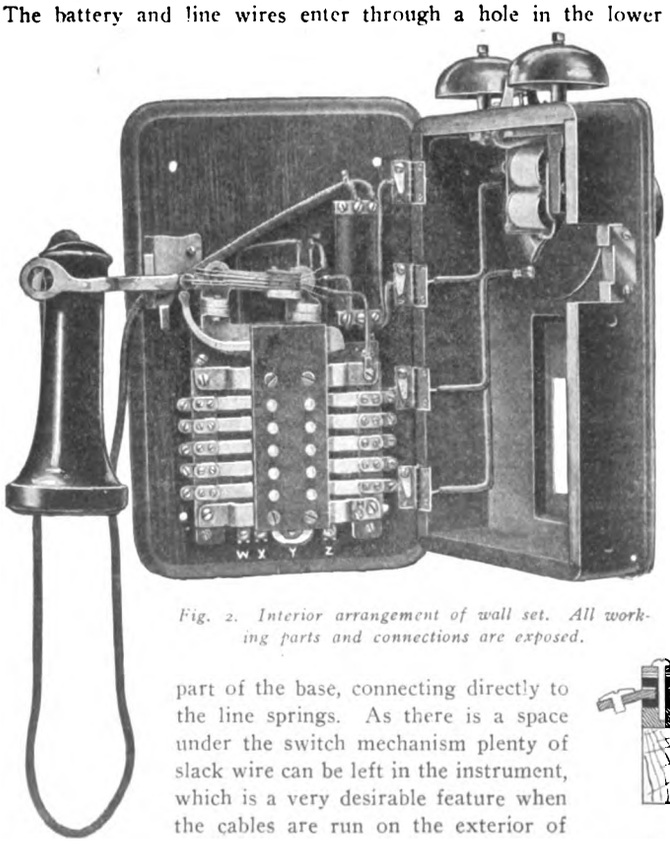

Fig. 2. Interior arrangement of wall set. All working parts and connections are exposed.

A portable desk type with the cover removed is represented in Fig. 3. This desk stand has a capacity of 26 lines, but its simple construction and few working parts are said to preclude any possibility of the trouble which always arises from a multiplicity of spiral springs and weak contacts. As in the wall sets there are no floating springs, and by removing the cover and base plate, every part is accessible and in full view. A flexible cable connects to the springs which are mounted on a circular fibre ring.

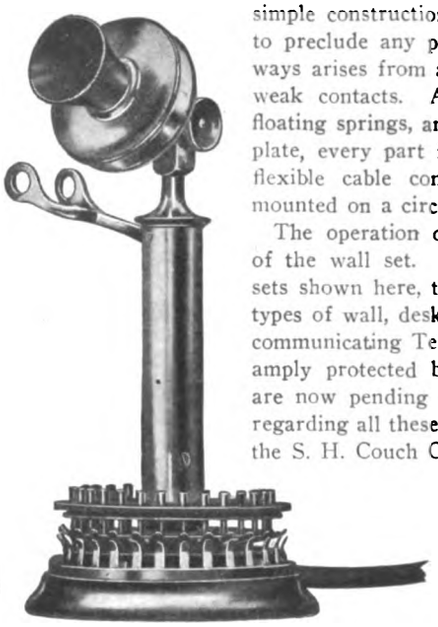

Fig. 3. Portable desk stand and 26 line switch.

The operation of the desk set is similar to that of the wall set. In addition to the wall and desk sets shown here, the complete line includes 10 other types of wall, desk and flush Automatic Reset Intercommunicating Telephones. These telephones are all amply protected by patents, and additional patents are now pending on the same. Further information regarding all these types can be readily obtained from the S. H. Couch Company, Inc., Boston, Mass.

ADDITIONS AT TOLEDO.

THE Home Telephone Company at Toledo, O., reports a very prosperous year, due to the large and rapid increase in the number of its subscribers.

Not long since the original equipment was increased from 6,000 to 7,000 lines, and now comes another order to still further increase the equipment about 1,400 lines, making 8,400 to be installed immediately. At this rate of progress it will not be long before the main office will have reached the limit of its switchboard capacity of 12,000 lines.

In addition to the regular line equipment there are many private branch exchanges in the city, having from 20 to 150 telephones each. There is also the exchange at East Toledo of something like 2,000 lines. The equipment at Toledo, furnished by the Sterling Electric Company of Lafayette, Ind., appears to be satisfactory to stockholders and subscribers alike, and this is claimed by its manufacturers to be a strong argument in favor of the impedance coil, single relay system. The simplicity of the apparatus can be judged by the fact that for 7,000 lines now installed on the main board only 7,000 relays—which also act as impedance coils—are required.

THE ELECTRIC APPLIANCE COMPANY, Chicago and San Francisco, is placing on the market a new model combined lightning arrester, fuse block and switch cut-out, with porcelain base. This device has been approved by the National Board of Underwriters.

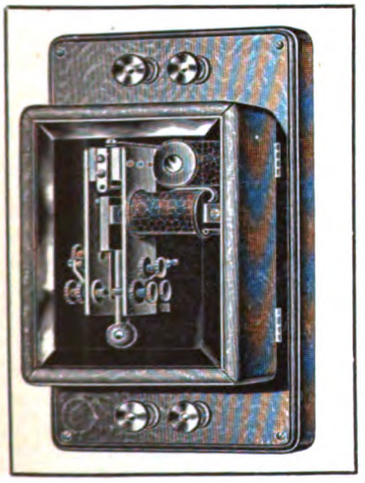
"DO YOU GET OUR RINGS"

NON-INFRINGING.

To Those of Our Customers Who Have Already Inquired and Those Who May Desire to Know:



That the Sandwich Pole-Changer, "while its appearance in the cut is strikingly similar to the Illinois," it is a very different and much better instrument. The Sandwich Pole-Changer Company is not the successor of the Illinois Electric Specialty Company. They simply purchased the tangible property of the Illinois Company last June, who had been doing business at a loss for several years, and this is the reason why *their suit went by default.*

The Sandwich Pole-Changer was put on the market by E. C. Hennis, who employed the most careful and able Patent Attorneys to see to it that this instrument was absolutely non-infringing, and it infringes no patent, then or since issued on Pole-Changers.

The Sandwich Pole-Changer Company is strongly backed financially, and is placing these instruments on the market by the hundred each month, and will protect the interests of its customers and users, as well as its own, to the end.

The Sandwich Pole-Changer is an up-to-date instrument made by the best of mechanics, of first class material. Sent on thirty days' free trial, and is in the market to stay.

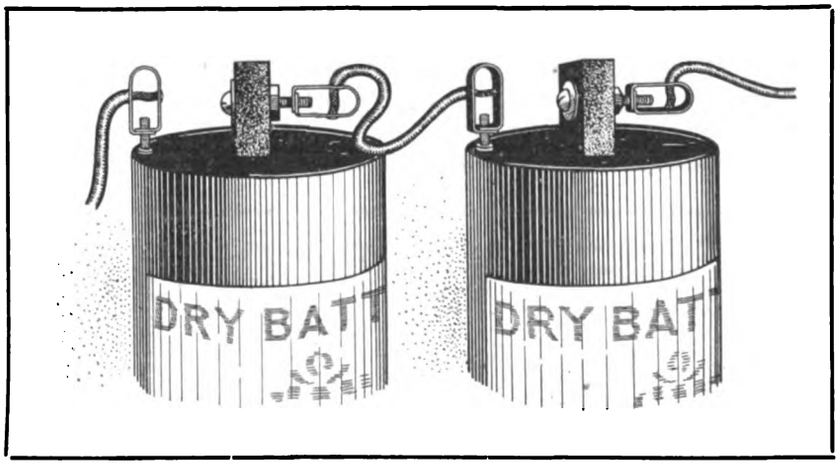
IN THE MANUFACTURING FIELD

A NEW BATTERY CONNECTOR.

MAKING connection between the different cells of a battery has always entailed more or less trouble. The jumper wires had to be skinned and thoroughly cleaned, and even when put in position, there was always the possibility of the binding screws working loose. To overcome these difficulties and at the same time to produce a connector which would be simple in design has been the endeavor of many inventors with varying success. A connector, known as the "Bulldog," is being placed on the market by the American Electrical Novelty and Manufacturing Company, New York, which offers an excellent solution to the problems involved. It consists of a piece of spring copper, bent in the form of a U, with the ends bent inwards at right angles. Through the ends holes are drilled just large enough to admit the regular screw binding post. To place it in position, the ends are pressed together until the holes come in line, when it can be readily slipped over the screw. Releasing the pressure the two arms grip the liberated portion of the post securely. With this arrangement no nuts are required, and at the same time, an excellent mechanical and electrical connection is secured. A short piece of insulated wire is soldered to each pair of connectors, so that they are available for immediate use at all times. Further particulars and prices will be furnished by the manufacturers upon request.



Bulldog Battery Connector, Designed for Making Firm Connections in a Minimum Length of Time.

THE STROMBERG-CARLSON TELEPHONE MANUFACTURING COMPANY, ROCHESTER, N. Y., AND CHICAGO, ILL., has recently issued Bulletin No. 14, which deals with private branch exchanges. In a very thorough manner the subject of installations of this character is taken up and well analyzed. In fact, the publication is intended for the use of managers as a reference work. Following the introduction comes a description of the equipment, each part from relay covers to cabinets being treated separately. Then the description of the standard type of private branch exchanges is taken up in detail. Of these twelve are illustrated with halftone engravings and cross section drawings, giving dimensions. The bulletin concludes with specifications for power switchboards and a summary which is intended to act as a guide for equipment when placing an order. Managers and others interested can secure a copy by addressing the company.

THE ELECTRIC APPLIANCE COMPANY, Chicago and San Francisco, is mailing a folder, dealing with the 1900 battery, which it handles. It claims that eighteen years of experience in manufacture has brought the type of cell to a point where it can be depended upon to give better service with least trouble and a saving of money. The firm will be pleased to place trial orders or furnish quotations upon barrel lots.

THE BAIRD MANUFACTURING COMPANY, 6 Michigan street, Chicago, announces that the Seward County Telephone Company ing the Baird Secret-Service system on its rural lines, The fact that the Beaver Crossing exchange where these instruments are being installed is within 30 miles of Lincoln, Neb., and the Lincoln Telephone Company is using over 300 lock-out telephones manufactured by the Baird company is pointed out to show that the system recommends itself to those who observe it in practical operation with considerable force.

GENERAL STORAGE BATTERY COMPANY ENLARGES PLANT.

WE are informed that on account of the great increase in the demand for its Bijur "High-Duty" elements, the General Storage Battery Company has decided to enlarge its factory at Boonton, N. J., by erecting buildings furnishing an additional 48,000 square feet of floor space, and to install hydraulic, and steam or gas generating machinery, aggregating over 1,000 horse-power.

THE SWEDISH AMERICAN TELEPHONE COMPANY announces that it has recently moved to 1760 East Ravenswood Park, Chicago. All correspondence relating to the high-grade telephone apparatus manufactured by this company should be forwarded to its new address.

THE WESCO SUPPLY COMPANY of St. Louis, Mo., announces that it has made arrangements for the southwestern agency for one of the largest and oldest manufacturers of telephone cable, and is prepared to quote the lowest prices on any quantity of cable to meet any desired specifications, and to make immediate deliveries from a large stock which it will carry at St. Louis.

THE FAHNESTOCK ELECTRIC COMPANY, 132 Havemeyer street, Brooklyn, N. Y., is distributing a three-page folder, which describes its spring type binding posts. Three different types are illustrated. No. 4, intended for small and medium size wire is the size used on dry cells; a sample of this will be sent free upon request. No. 7 is somewhat larger and will take wire up to No. 5 B. and S. in size. A sample of this type will be sent to interested parties for four cents. The No. 9 is a duplex post having spring connecting surfaces at both ends, so that it will hold two wires, each of which may be disconnected at will without disturbing the other. This post will hold the same size wire as No. 7 and both these types are made from high copper phosphor bronze. These sizes will be found of value for large wire connections around the exchange. The manufacturer will forward a sample of this type for eight cents. Besides fully describing the uses and advantages of this post, the folder contains a list of leading battery manufacturers who supply this type of post free upon their dry cells.

THE KAYE AND CARTER LUMBER COMPANY, dealers in cedar posts, poles, piling, ties and lumber, announces the removal of its offices to 604 Lumber Exchange, Minneapolis, Minn. All correspondence should be forwarded to the new address.

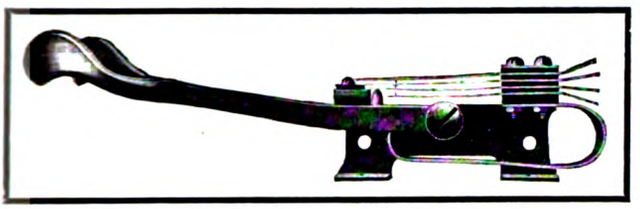
TROUBLE and HOOKS Have always been inseparable



No part of the telephone receives harder usage or more abuse. Long has it been known that SUMTER Hooks were "all right."

And now we offer a new one. Here are some of its features:

1st—Hook lever easily removable without removing escutcheon plate or changing adjustment of contact springs.

2nd—No circuit through hook lever, hook spring, or joint. Hook lever thoroughly insulated, no possibility of receiving a "shock."

3rd—Contact springs are long and flexible and are pointed with genuine platinum. They are held under tension and come to rest on a rubber block; when the receiver is removed from the hook, there is **no lost motion** to overcome.

4th—There is a rubbing contact between the different springs, and the contact points bite into each other.

5th—Every part is die made and interchangeable.

6th—The hook lever is a heavy brass **casting**, graceful in design.

7th—Like all good things this is well finished. **Every** part is heavily nickeled or oxidized, and is made the best we know how to make it, and—**WE KNOW HOW.**

THE SUMTER TELEPHONE MFG. CO. = = SUMTER, S. C., U. S. A.

THE WEEK'S MESSAGES

FINANCIAL.

BELVIDERE, ILL.—Belvidere Telephone Company has declared its quarterly dividend of 2½ per cent.

GAYS, ILL.—The Gays Mutual Telephone Company has increased its capital stock from $5,000 to $10,000. Messrs. Hardinger, Blythe and Treat were appointed as a committee to go to Sullivan to assist in the organization of a mutual company to connect with the Gays Company.

MAROA, ILL.—The Maroa Telephone Company has declared a 7 per cent. dividend.

NEWARK, O.—The Newark Telephone Company has declared a 3 per cent. semi-annual dividend on its preferred stock and a 2 per cent. quarterly dividend on its common stock. The preferred stock has been increased to $50,000. This money will be spent in the improvement of the company's system.

SIDNEY, O.—The Sidney Telephone Company has declared a semi-annual dividend of 2½ per cent. on its common stock.

ZANESVILLE, O.—The Gilbert Telephone Company has increased its capital stock from $200,000 to $700,000.

SALT LAKE CITY, UTAH.—The Utah Independent Telephone Company has declared a quarterly dividend of 1 per cent. The lines of the company are being extended in all directions.

FRANCHISES.

FLUSHING, MICH.—The Shiawassee & Genesee Mutual Telephone Company has been granted a franchise to construct a telephone system in Flushing.

ALBERT LEA, MINN.—The Albert Lea Telephone Company has applied for a franchise to construct a telephone system.

PARK CITY, UTAH.—The Utah Independent Telephone Company has obtained permission to operate in Park City.

CLYDE, WASH.—E. H. Bradbury has been granted a franchise to construct a telephone line between Clyde and Lamar.

COMBINATIONS.

CERESCO, MICH.—The South Emmett Telephone Company has been organized with a capital stock of $1,000. The stockholders are John Ulrich, E. T. Eyre, R. M. Gubbins, Jacob Paul and Medeven Getchell.

NEWS—WANTED

THE matter contained upon the Message and Operating Field pages of this paper is contributed largely by our special correspondents. We believe, however, that there are many valuable items of telephonic interest which are never brought to the attention of the public. There is no reason why this condition should exist, and the Editor, therefore, invites all telephone companies and the officials of such companies, to furnish any information that they can consistently make public relative to financial statistics, new construction, elections, franchises and personal items.

OUR MOTTO—QUALITY AND PROMPT SHIPMENTS.

KELLOGG "MICHIGAN WHITE" CEDAR POLES

THE poles we handle are all carefully selected, and are the best grade of stock.

All shipments are prompt, subject only to car supply.

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices.

We have recently published a little book giving some very valuable information about Cedar Poles. It contains Specifications, Inspection Comments, Shipping Data, Etc. "Yours for the asking."

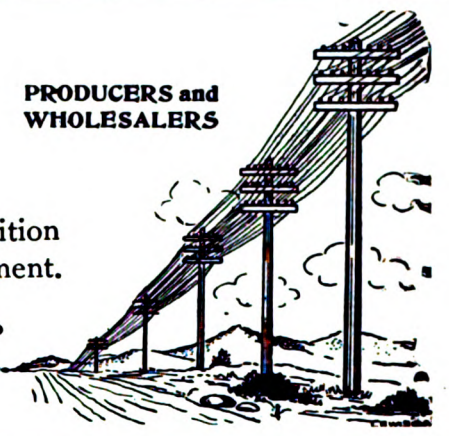
KELLOGG SWITCHBOARD & SUPPLY COMPANY - - - CHICAGO, ILL.

PITTSBURG & LAKE SUPERIOR IRON CO.,
ESCANABA, MICHIGAN.

PRODUCERS and WHOLESALERS

WE always carry a large stock of all sizes of White Cedar Poles, and having yards on all principal railroads in Northern Michigan and Minnesota, are in position to make immediate shipment.

"From the Stump to the Line."



CEDAR POLES

Upon a foundation of SQUARE DEALING we have built a pole business excelled by none. Our reputation is of more importance than your order, therefore if you buy from us, you will be assured of getting what you want.

We solicit your orders and can please you in quality and prompt shipments.

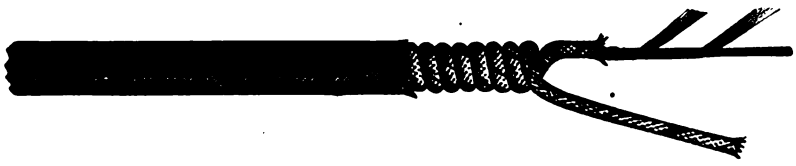
THE CORD THAT LASTS.



This cord consists of two steel piano wires covered with a spiral of fine copper wire. The cord is then insulated with a silk and cotton insulation and each conductor is covered with a cotton braid, one of the conductors having a red tracer so as to distinguish it from the other. The conductors are then formed into a spiral and covered with a heavy, waxed, gray Gilling Thread.

"EACO" STEEL SWITCHBOARD CORD

will outlast anything on the market. Write and get prices, and when doing so state what make of switchboard you are using.

North Common Battery Telephones.

The hinged front of "NORTH'S" common battery wall type telephone renders the condenser and instrument wiring accessible without removing from the wall.

The cabinets are not veneered, but every stick of lumber is from a veneered mill; for they handle nothing but the most beautifully figured woods. The stock is 18 months old, kiln dried 30 days and given a hand rubbed finish involving 7 processes.

They are equipped with the following standard parts, and will operate on any standard common battery system.

"NORTH'S" Solid Back Transmitter that combines ample volume, perfect articulation, deep penetration and natural pitch.

"NORTH'S" Permanently Adjusted Receiver. The diaphragm does not rest on the outside shell, but on a bell-shaped metal seat—it isn't thrown out of adjustment by unequal expansion of hard rubber and magnet metal.

"NORTH'S" New Ringer, provided with a knife-edge, weighing-scale bearing armature—it can't tighten or drop out of place.

"NORTH'S" Horizontal Lever Adjustable Tension Switchhook with long flexible contact springs—they can't break or become misplaced, and always resume their normal positions.

The parts are individually tested—the transmitter by an engineer. There are two inspections during assembling, a final test on completion and again a test before shipping—just to make sure.

THE NORTH ELECTRIC CO.,

CHICAGO CLEVELAND DALLAS

OF INTEREST TO YOU

"STANDARD" TYPE XX

If you are in any way connected with, or interested in, the purchasing end of a telephone system, this will be of interest to you.

We manufacture and sell direct, the most practical and improved telephone condensers on the market—

Andrae Condensers

They come in three distinct styles—two illustrated herewith—and each style is fully guaranteed.

To convince you of the reliability and worth of these instruments and to show the utter confidence we place in their ability to "make good," we will equip an entire line on trial and pay return charges if not found satisfactory.

Could we offer you a more liberal proposition?

"ANDRAE TELEPHONES NEVER DISAPPOINT"

Our catalog can be had for a postal. Why not send for it TO-DAY?

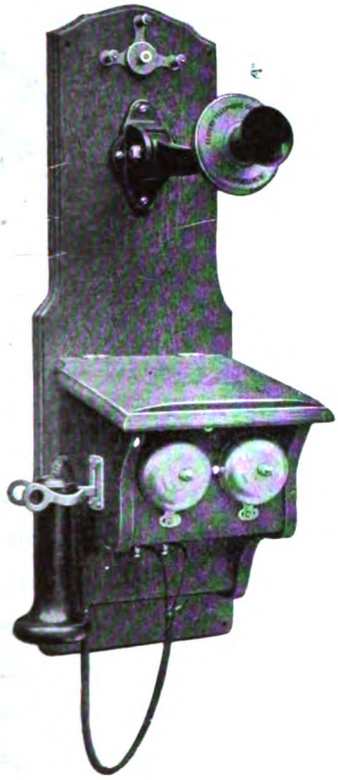
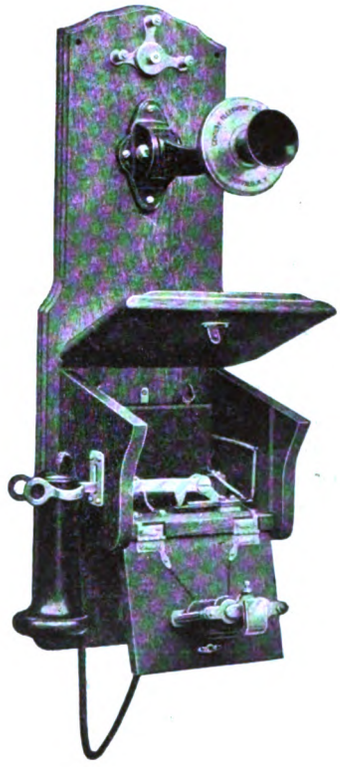
CENTURY

100 % GOOD

IN COMMON BATTERY TELEPHONE SERVICE





it is absolutely necessary that the telephones are perfect, electrically and mechanically.

We manufacture wall and desk telephones for this class of service. During the past five years these telephones have proven to be the most efficient and reliable made.

Our No. 70 wall telephone is so constructed that all parts are easily accessible.

The cabinet, made of quartered oak, is small and well proportioned.

The telephone is equipped with our No. 5 Platinum Electrode Transmitter and No. 11 Perfection Receiver.

A trial of this instrument will convince you of its efficiency and reliability, and if interested we will be pleased to send you one or two of these instruments on 60 days' trial, charges prepaid.

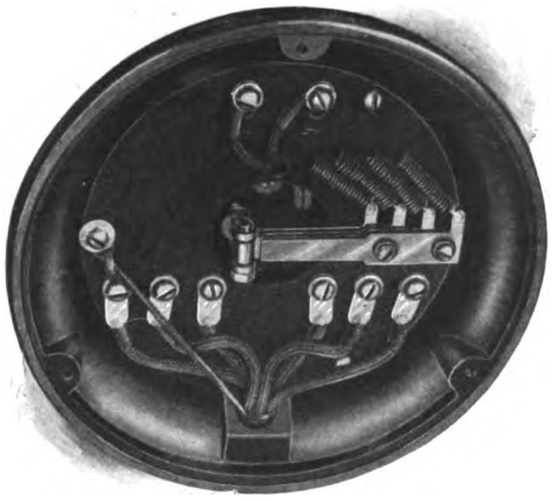
MONARCH APPARATUS

THE DESK SET



All wiring of a Monarch Desk Stand terminates in the base. The transmitter connections are metallic, and are brought down in two conductor silk cord. The hook switch springs being mounted upon the base, no other wiring passes through the pedestal tube. The connecting plate is made of hard rubber. All connections are plainly marked. Clips are provided for the receiver and connecting cords. All connecting plates are interchangeable. Local battery desk sets can be made to common battery by changing the connecting plates and transmitters. All Monarch Telephone Apparatus is described in the new catalogue. A copy will be sent upon request.

Patented

TYPE A—10-Pair Hall Cable Box.

CABLE TERMINAL EFFICIENCY.

A great deal of the efficiency of a cable plant depends upon the terminal and distribution facilities. And what is more, the type of terminal is of the greatest importance. Some of the points to be considered in its selection are protection, "getatability," compactness, rigidity. Considering these features collectively or individually you cannot find a terminal on the market that is superior to the HALL. Protection was given the greatest attention in its design so that when you buy a

HALL CABLE TERMINAL

you have bought protection against lightning, sneak currents, or crosses with dangerous circuits. The "getatability" of the Hall is unique. When the cover is taken off the top, bottom, front and back are exposed. No opportunity here for faulty inspection.

Compactness? Just look at the illustration. That tells its own story.

Rigidity? An all-metal framework carries the terminal plate. We couldn't make it stronger if we tried.

Seems to us you ought to get prices. Your name and address will bring them, and some more facts that will be of value to you.

DEAN TELEPHONE APPARATUS

"There Must Be a Reason."

LONGEVITY

We claim extremely long life for our telephone product—an efficient and active life.

Our equipment is entirely new, not a re-hash of old apparatus (so called "new models") and each design has been carefully proven out in practice by the largest and most conservative buyers.

The materials used are those which have stood the test of many years in telephone apparatus construction—the best to be had for each individual purpose. We know these materials and their proper uses (one of our most valuable assets), hence we know that our apparatus will enjoy an unlimited life—the longevity that is an enemy to maintenance expense.

This is another reason why our product will help to pay your dividends. Incidentally, a reason for the unprecedented growth of our business.

It will pay you to try the celebrated Dean product in your new year's construction.

The Public Makes Your Record

LET THEM MAKE IT POSITIVE

The BAIRD Pay-station has a lever by which the Public tells the operator

WHAT COIN IS DEPOSITED

Without the LEVER the signal is Weak and UNCERTAIN.

With it it is CLEAR.

BAIRD MFG CO., 6 Michigan St., CHICAGO

SIMPLICITY

is the Keynote of Success

A simple device which accomplishes the same results as a more complex one is certainly more preferable. The Sandwich Pole-Changer is the simplest device ever constructed for ringing purposes. There are but three contact springs and as these engage alternately with their opposite sides they cannot be forced out of position by constant use.

It requires no adjustment, as this is done at the factory and is permanent.

The use of a primary constant current battery to operate the vibrator has been dispensed with; a minute quantity of current, hardly a milliampere, being taken from the ringing battery, through suitable resistance coils for this purpose.

It will work in either a vertical or horizontal position, which permits it being hung on a wall or mounted on a cabinet. Another excellent feature is that it is practically noiseless. There are others which are described in our free booklet. Let us send it to you.

Evidence to Prove All Our Claims

for the Generator Call Visual Signal Switchboard, we have been telling you about the last few weeks.

CITIZENS' TELEPHONE COMPANY OF LAWRENCE CO.

LAWRENCEVILLE, ILL., 9-17-'05.

Stromberg-Carlson Tel. Mfg. Co., Rochester, N. Y.

Gentlemen: Replying to your favor of the 16th inst., I am pleased to advise that the Visual Signal Switchboard purchased from your company, a little over a year ago, for our Summer exchange is giving perfect satisfaction. In view of the almost extravagant claims you made for it, I expected to be disappointed in some of the particulars, but the only disappointment met with so far is that the board has fulfilled every promise you made for it.

Wishing you much success, I am,

Yours very truly,

G. H. CUNNINGHAM, Mgr.

What better evidence do you want that this is the switchboard for you to buy, than facts of this kind from the user? If you could have an opportunity to see one of these boards operate, you wouldn't want any other evidence to prove its high quality. There are a good many of them in use. Maybe there is one in your territory to which we can refer you.

Let us mail a copy of our bulletin and quote you prices. Remember we have standard cabinets of 60, 70, 100, 140, 180 and 200 lines.

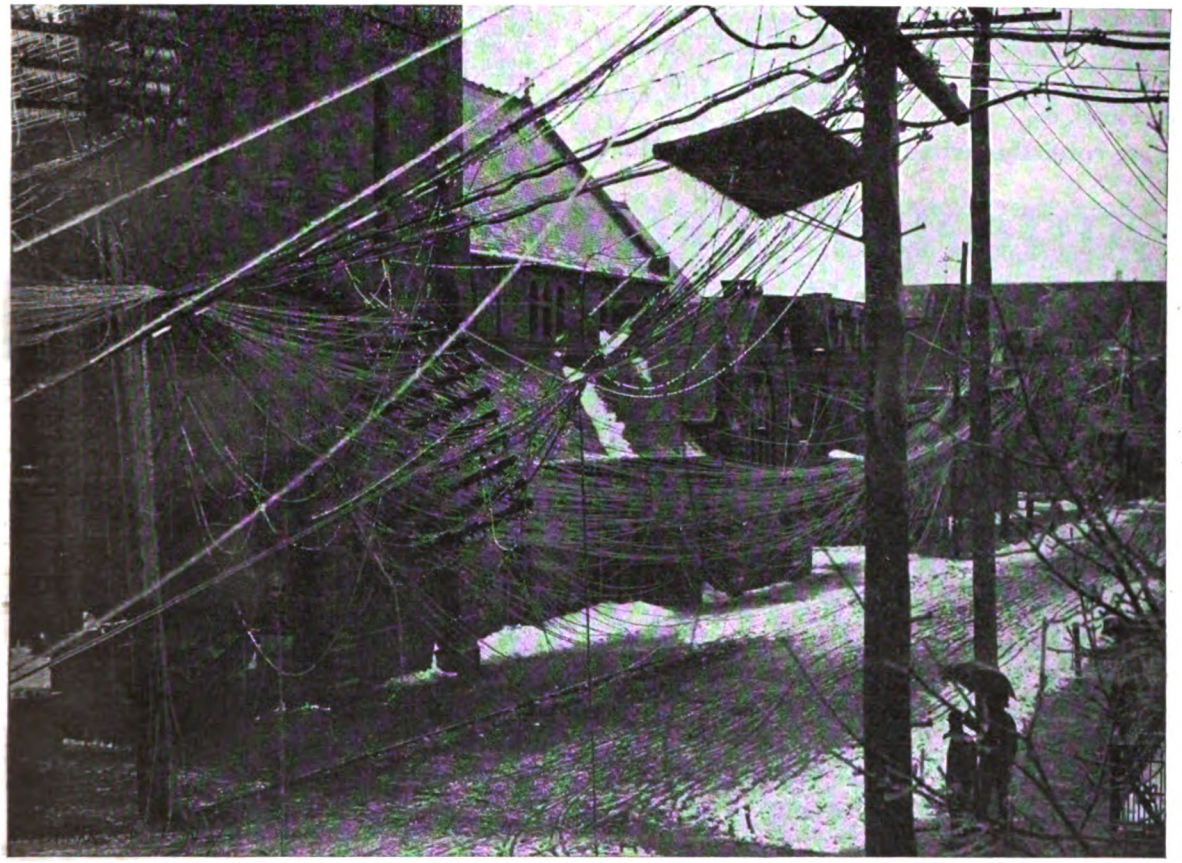
WE MAKE CABLE

No. 3—Mental Damage

You probably know what it is to have a lot of wires down after a storm. You also know the demoralizing effect it has upon your organization. Line signals burning continuously or drops falling every minute. Parties out of service calling up and overloading your chief operators. Everyone is working under an extraordinary mental strain, and as a result the rest of the business suffers.

Operators and other employees who are normally calm and collected lose their heads and address the subscribers in a curt and unreasonable way. The result is your patrons become angry and it requires lots of tact and time to overcome their anger.



Every such occurrence as this causes a loss of confidence which is very difficult to regain and which lessens the number of your subscribers.

Comparisons are generally odious and when one man, who has experienced the loss of service due to the breaking of wires, talks it over with a man in a town where cable is used, the chances are your company is not complimented. Do not put off the change, for the time may come when you will regret the delay.

Write for our booklet about cable, and then let us estimate.

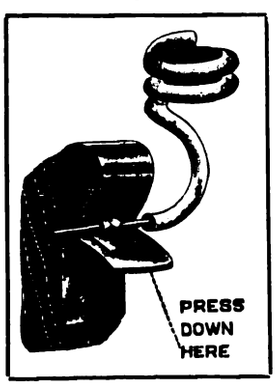
EXPERIENCE

We all learn by experience. If you are a user of dry batteries you must have learned from past experience that the screw and nut binding post is not entirely satisfactory for this class of work.



You know how it works loose at the most inopportune times.

You know that if the nut is set down sufficiently hard to hold the wire firmly that it is very liable to injure or weaken the wire and increase the possibility of its being broken off.

You know that it is the small troubles that eat into your profits, cause hard feelings amongst your subscribers and as well account for a large part of the inspector's time.

If you admit that this is true, then why not profit by your experience and specify

FAHNESTOCK SPRING BINDING POST

when next you order? It will not add a cent to the cost of your cells, and it will save you a lot in the long run. Give it a trial on your next order. Sample free.

The New Long-Distance Board at Toledo

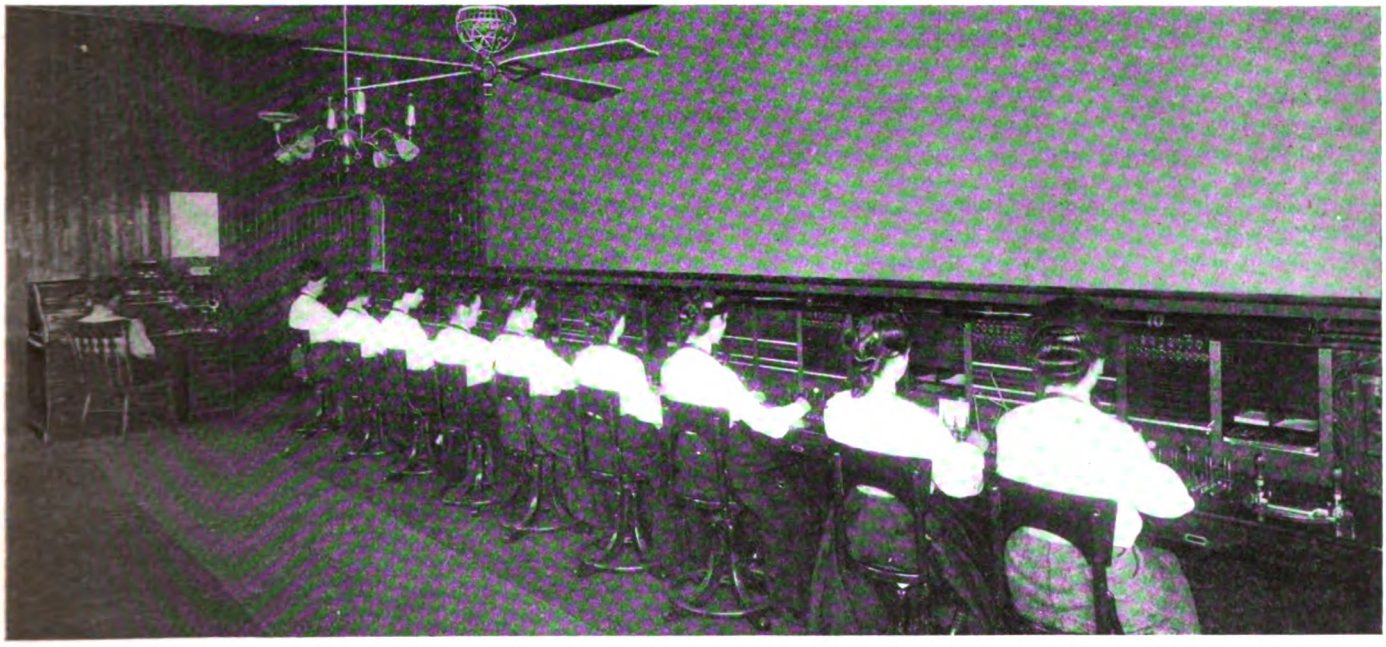
By Marshall S. Thompson.

THE new exchange of the United States Telephone Company, in Toledo, Ohio, which has been in operation since May, 1905, is a conspicuous example of the high state of perfection which has been attained in the installation of equipment of the most efficient type, and in a system of operation which conforms to the most advanced standards for the handling of long distance business. The toll board consists of five two-position sections. The framework of the switchboard is wood and steel in two-position units, five sections forming a continuous board with a five-panel jack multiple. All cables and wires in connection with the board enter it aerially at the top of the terminal section at the left-hand end. Suitable pins and racks are supplied for taking the cable from section to section. Steel brackets are provided for supporting the cables on a level with the apparatus to which they are connected, and the uprights of this framework are so placed that the multiple cables may be connected to the jacks outside of the board and then readily installed.

A cable board is provided near the floor in the back of the section upon which run the battery and ringing leads. The jacks, lamp sockets, keys, etc., are so mounted and arranged that equipment can be installed at any point in the five panels and readily raised or lowered. The strips of jacks are one-half inch thick. All other apparatus mounted in the jack panels is the same thickness or a multiple thereof. Relays and other apparatus which it is necessary to locate on the framework are all in accessible positions. Exposed cabinet work, including cable boxing in the exchange room is quartered oak, dead finish, fitted on the steel framework. The rear of the board is enclosed with hardwood doors, with an imitation oak finish, so arranged that they may be readily removed. Keyboards are built up of five layers of oak, the grain in alternate layers running in different directions to prevent warping. They are separately hinged and locked and arranged to provide for easy access to the keys and wiring. Plug shelves are of oak, covered with *leather*, natural finish, close up to the hinges. Calculagraphs are installed between the two adjoining operators of each section.

The individual pieces of apparatus used are of the standard types. Jacks are provided with German silver springs and pure platinum contacts, mounted in blocks of hard rubber. The lamps used as supervisory signals and calling-in signals have an illuminating value of one-third candle power and operate off a battery of 30 volts. The lamps used for busy signals are designed to reach their full illumination on a 40-volt circuit. They are used on a 30-volt circuit, and glow with a brilliancy less than that of the line signals, this being standard practice for this class of signals.

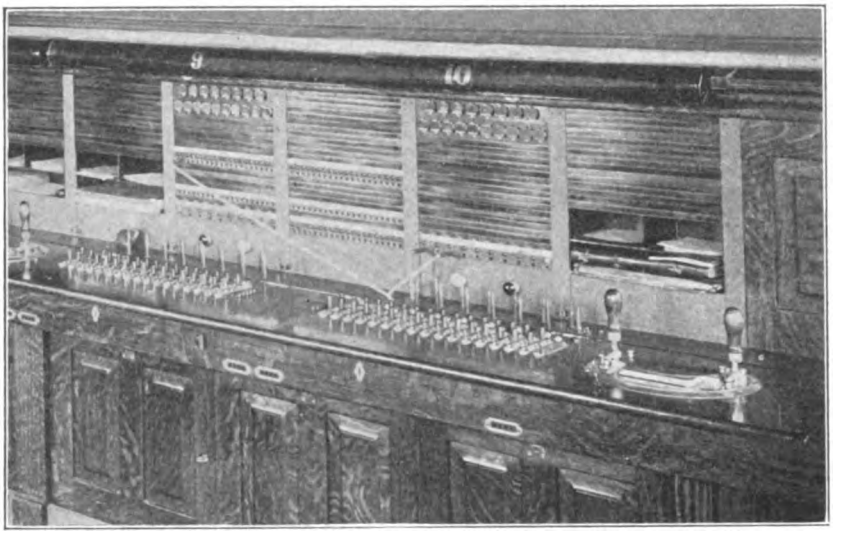
Lamp sockets installed in the jack panels are mounted in strips of ten or twenty to correspond with the strips of jacks with which they are associated. The lamp sockets for use in connection with the supervisory lamps in the cord circuits are mounted singly, as also are the lamp sockets used in connection with the pilot lamps. Lamp caps for supervisory and calling-in lamps are white and are protected from breakage by open work metal caps. The lamp caps of the busy lamps associated with the toll line and office trunk multiples are red. Lamp caps used for the pilot lamps that are wired in connection with the calling-in lamps at the different positions are white. All cords are of sufficient length to reach every jack in the entire section when the ultimate number of lines is installed. The keys are all of approved design, fitted with the best grade of German silver springs mounted on rigid metal frames insulated with the best quality of hard rubber. Contacts are of pure platinum. The keys mounted in the jack panels are known as the locking plunger type, mounted on the same size stripe and same spacing as the jacks with which they are associated. Relays have German silver springs with pure



The New Toll Board in the Office of the United States Telephone Company at Toledo, Ohio.

Digitized by Google

platinum contacts, and are mounted on steel mounting strips and covered with dustproof cases. They are easily accessible and removable from the strips. The windings are of silk insulated copper wire. Supervisory relays in connection with the cords are mounted on strips in the back of the boards. Line relays and cut-off relays are mounted on the relay rack. Transmitters used on the toll board are of the breast plate type. They are constructed principally of aluminum and weigh only 6.8 ounces. All switchboard wire and cable used in connection with this board is made of annealed copper wire with a tinned surface. Each wire is insulated with one wrapping of silk and two of cotton. All talking circuits in the toll board are strictly metallic twisted pairs, and so arranged as to prevent any cross talk or other inductive disturbances. Each operator's position is numbered with a gilt figure placed on the electric lighting reflector. On account of the low height of the key shelves no foot rail is necessary. A strip of rubber is, however, placed along the bottom of the front panels for protection. The front of the toll board is lighted with 110-volt 4 C. P. incandescent lamps, over which is a reflector of the trough style.



End Section of Toledo Toll Board, Showing Arrangement of Apparatus.

The relay rack is constructed of structural angle iron and braced so that it is perfectly rigid. It is designed for mounting strips of relays of the standard width, two inches, or strips of other apparatus the same dimensions or a multiple thereof. The iron work was given two coats of black paint, dull finish. The relay rack has a capacity of 48 strips of ten relays each.

The distributing frame is also constructed for structural angle iron for mounting the necessary terminals for connecting cable from the different pieces of apparatus. Suitable racks and holders are provided for placing and removing the jumper wires. The rings through which the jumper wires pass are enameled. The terminal clips are mounted in hard rubber and well tinned for soldering. The holes through which the jumper wires run in the wooden blocks upon which the terminal clips are mounted are large enough to take six single No. 20 B. and S. gauge jumper wires. The frame is so constructed that the terminal blocks in units of 20 can be added at any time. The iron work of this rack is also given two coats of black paint. The distributing frame has a capacity for 800 pair of triple terminals on each side, and the present equipment of the terminals comprises 19 blocks of 20 triple terminals each and 22 blocks of 20 pairs.

The fuse board is made of a single slab of clear slate of the best quality and provided with suitable bus bars and terminals mounted on an iron frame designed for fastening upon the wall. All wiring is brought to the back of the board. The board has a capacity for 30 pairs of transmitter leads arranged for one ampere fuses, and 30 battery supply taps for 1 to 5 ampere fuses. The equipment was furnished by the Stromberg-Carlson Telephone Manufacturing Company.

The present layout of the positions, showing the class of work handled on each is as follows: Position No. 1, information; position No. 2, line; position No. 3, line; position No. 4, line; position No. 5, recording; position No. 6, recording; positions Nos. 7, 8, 9 and 10, line. In addition to these there is provided one supervisor's wall set. The board is equipped for 40 outgoing trunks, 40 toll lines, 20 recording trunks and 20 office trunks. The information position is equipped with toll line multiple, service trunk multiple and five ring down trunks multiplied throughout the board. The duty of the operator at this position is to relieve the line operators of all unnecessary work outside of the handling of straight business, thereby increasing the efficiency of the service as rendered by the line position operator. It has been found desirable to refer to this operator all incoming calls on which the line operators receive the report "don't answer" or "out of order" for her verification from the local company. She also takes up for future action all calls upon which the line operator has made at least three unsuccessful attempts to reach a busy telephone. The information operator also has referred to her all questions from the public relating to service, charges on messages, rates, etc. All messengers are sent by the operator at this position. Copies of the latest issue of both local telephone and city directories are kept before her and trouble in locating a party is referred to the operator. Also, a list of daily changes and entries in the local telephone directory is recorded at this position.

Positions No. 5 and No. 6 are used solely for recording, and as a common drop board when only the night operator is on duty, thereby making it possible for her to handle all the business from one position. This section is equipped with 20 recording trunks. These are multiplied before each "A" operator at the local office and the subscriber calling for "long distance" is directly placed on one of the above trunks and answered immediately by the recording operator, who records the call upon a toll ticket in the regular manner, advising the subscriber that he will be called as soon as his party is secured. The ticket is then passed to the proper line position. In addition to the necessary information for securing the party desired the recording operator always places on the ticket her personal number and the time the call is received from the subscriber. The present recording trunks are multipled at each recording position, making it an easy matter to answer signals upon these lines from other positions. This is a material aid in giving very prompt service to the subscriber. The recording operators also have access to toll line multiples, service trunk multiples, chief operator, information operator, supervisor, wire chief and other long distance terminals.

At the remaining positions occupied by regular line operators each operator has before her a multiple of the toll lines, service trunks, inter position trunks, and five answering jacks for toll lines terminating at her position. At present the United States Telephone Company is operating out of Toledo thirty toll lines, averaging about four lines per position. Those positions having more than this number handle local short haul toll lines. These lines are grouped and classified at each section as nearly as possible in accordance with the direction they take, thereby concentrating the business going in a certain direction at the same position. This gives the operator the advantage of having all calls originating in that particular part of the territory handled at her section, greatly increasing the efficiency of the service. Before the installation of the new equipment at Toledo the line positions were averaging about 173 tickets per position per day. The average now is 144 tickets per position. In addition to the load the line positions are carrying, records are being secured at various times showing the number of calls, good and lost, handled per day on each circuit. Upon these records is based the traffic manager's recommendation for additional circuit facilities.

The method of handling calls conforms to the following routine:

Digitized by Google

The recording operator upon taking the call from the subscriber immediately releases his line and it is not taken up again until the line operator is ready to establish the connection or give the subscriber a definite report on his call. It has been thought advisable at certain offices where the line operator expects to complete her call within a five-minute period to pick up the subscriber's line immediately upon her receiving the ticket, but owing to the small percentage of busy reports at the Toledo office, this has not been done, as it places more or less of a hardship on the subscriber by having his line out of service during these periods. The holding of toll circuits by operators is one of the greatest evils a long distance company has to contend with to-day, and until this is eliminated to a much greater extent there will always be a congested condition of circuits, and all offices will suffer accordingly. In this office the line operator does not hold the toll circuit to the distant office unless requested to do so by the distant operator, and in case the circuit is built up through one or more offices the line under no circumstances is to be held for a longer period than five minutes. The line operator reports immediately to the subscriber upon receiving a definite report relative to his call, and such additional reports as may necessary, but care is taken that the subscriber is not called to his telephone from time to time only to receive indefinite reports, such as busy, etc.

In the case of inquiries relating to calls upon which a ticket has been made the recorder upon answering the signal from the subscriber, and finding that it is some one desiring information relative to a call which has previously been given, replies by saying: "I will give you the operator handling your call," and immediately connects the subscriber by means of an inter-position trunk to the position at which that call is being handled. This signal is always answered by the line operator saying: "This is operator number ——," giving the number of her line position, and she then proceeds to give the subscriber the desired information. In connection with this the importance of answering this signal promptly should always be impressed upon the mind of the line operator, as it represents a subscriber desiring information relative to his call, and speed is essential. The line operators refer to the supervisor all calls on which there has been a delay of twenty minutes and on which no definite report has been received from the distant office. The line operators are instructed to be careful to make notation on the back of a ticket relative to any interruption a subscriber may experience with the service.

The operators at the switchboard are under the control of a chief operator, who is directly responsible to the manager or superintendent for the work as carried on in the operating room. All persons employed in the operating room report to the chief operator, either directly or through the supervisor. Her duties consist in seeing that the work is properly distributed among the various positions, and that uniform service is being given with the greatest efficiency. Also, that her subordinates, such as supervisors, information operators, messengers, etc., are performing their duties properly. In addition to this she sees that all trouble, such as switchboard trouble, line trouble, etc., is reported promptly and remedied by those having that work in charge. The chief operator is also responsible for each day's business as sent to the billing department, and sees that all information on tickets, such as charges, elapsed time, and names are correct before they leave her department. All complaints from subscribers relative to the service are referred to her by the supervisors and operators for adjustment.

The supervisor is responsible for the work as carried on by the operators in her division. Eight positions or four sections are considered a sufficient number for one supervisor to have charge of. The supervisor having charge of a division is expected to constantly patrol that part of the board to see that all signals are answered properly and promptly, and that no unnecessary delay takes place on tickets at those positions, and to take up with supervisors at other offices such delayed calls as may come to their attention. All serious complaints, and matters which they are not able to handle are referred by supervisors to the chief operator for adjustment.

All service is graded and shown on the back of the ticket by numerals and letters, the numerals representing different degrees of service such as those due to the quality of transmission, interruptions, etc., while the letters signify the amount of monitoring the connection had. The different grades of service are as follows:

1. Very good, perfectly commercial. No interruptions from any source.

2. Good. May include slight, occasional or momentary interruptions. Commercial.

3. Fair. Difficulty in hearing, repeating, some line trouble and cut-offs. Commercial, overtime generally involved.

4. Poor and uncommercial. Repeated by monitor.

Monitoring Service.

(A) Undivided attention—frequent supervision, to be absolutely assured of service given.

(B) Divided attention, occasional supervision.

(C) No supervision after conversation fairly started.

For instance, A-1 shown on a ticket would signify that the operator had monitored this connection constantly, and that the service was perfectly commercial. This plan has worked out very successfully, and it not only gives clearer records as to the actual service rendered the subscriber, but is a great help to the operators in educating them to distinguish the different kinds of service.

The study of lost calls is a very important feature of the service and should be given special attention at every office, as it is often found calls are being cancelled on account of poor operating, etc., whereas, if the proper steps be taken to remedy these conditions, the percentage of lost calls for said office would be materially decreased. This would result not only in giving the subscribers better satisfaction, but would bring about a substantial increase in revenues. The present percentage of lost calls for the Toledo office is as follows:

Sent 12 per cent.; received 9 per cent.

Calls not completed by midnight are cancelled and considered lost calls for that day's business. However, these calls are taken up by the chief operator on the following day, and every effort is made to complete any she may think there is a chance of reviving. A great many calls are saved in this manner, and a separate report of these is made to the manager showing the number of calls, and the revenue derived from this source. This same action is taken on any received calls where there seems a possibility of making them good. Through the efforts on the part of the Toledo operators, although a certain number of these would probably have been revived by the subscriber if the initiative step had not been taken by the telephone company, the percentage of lost calls revived each month is as follows: Average sent calls revived over total sent calls lost 11 per cent.; average received calls revived over total received lost 9 per cent. A reason is shown why each call is cancelled and they are listed as shown in the following table, derived from the records of a typical month's business, showing the percentage of calls cancelled for each cause:

Cause.	Per cent.
Unable to hear	.6
Do not answer	11.4
Party refuses to talk	1.
No circuit	7.
Office closed	2.3
Telephone out of order	1.
Line out of order	2.
Party not there	9.
Party out; do not know when he will return	16.
Party unknown	3.
Party absent and not expected to-day	26.
No telephone	10.2
Unable to raise office calls	1.
Wrong number	.5
Total	100.

Service tests are constantly being made in order to ascertain the quality of the service rendered to the subscriber. These tests are made from the subscriber's station, and show the time consumed in getting Long Distance divided into three intervals, as

Digitized by Google

follows: First, Time "A", operator answers; second, interval between A operator and answer by L. D.; third, total time consumed in getting L. D. These tests are averaged in groups of 25 each, and at least one group is taken each week. Before the installation of the new equipment these tests showed that from 20 to 25 seconds were consumed in getting the Long Distance operator. To-day these tests show that only from 10 to 12 seconds are consumed in getting Long Distance. This difference in time is readily appreciated by the subscriber who is holding the receiver to his ear waiting for the operator to answer.

In addition to these, records are also taken of the business handled over the various circuits, showing the interval from the time the call is placed by the subscriber until either a definite report is received or connection is established. These records give a very clear idea as to the time consumed, both in passing calls, and getting connections established to various points throughout the territory. As individual efficiency tests, at least once every three months, twenty calls are timed upon each operator in the office. This record shows the actual elapsed time on the connection as timed by the stop watch, which is then compared with the elapsed time as shown on the ticket in question, and discrepancies in time are called to the attention of the operator at fault. This has been found to have considerable bearing on her record as an operator.

The use of the highest grade equipment and the skilful application of a knowledge of the means of securing the best results from the work of the operators under the direction of the traffic manager, Mr. E. D. Kramer, have enabled the United States Telephone Company to bring its service to a high degree of efficiency. The satisfaction afforded the users of this system is a most gratifying proof of the value which is now attached to the Independent telephone service.

A New System of Connections for Telegraphic or Telephonic Multiple Communications

By Dr. Alfred Gradenwitz.

A SYSTEM of connections by means of which some wires can be used in common in connection with several telephone or telegraph stations, communicating with one another only in sets of two stations each, has been designed by Mr. O. Arendt of Berlin, Germany. It may be said that the system can be used with safety both in the case of alternating and undulating currents. The self-induction coils employed to this effect have several windings wound in two groups upon a common iron core, so that an alternating or undulating current is choked if the

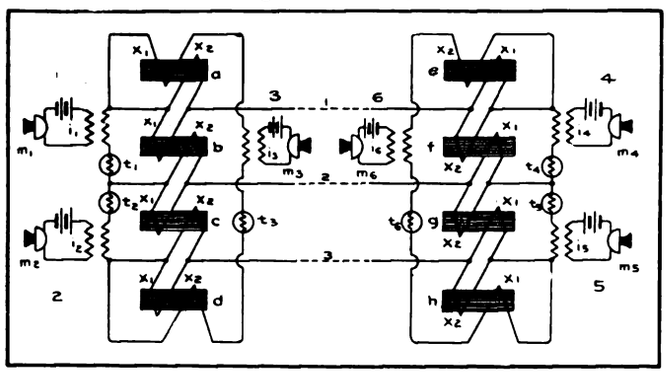


Fig. 1. Arrangement of connections for multiple transmission.

current only traverses one of the groups or some parts of these in the same direction, magnetising the iron cores, while it is allowed to pass when flowing through the two groups or parts of groups in opposite directions, exerting its magnetising action in opposite senses. These coils are connected to the system of conductors in such a manner that the combinations of two line wires liable to be effected at a time with a given number of wires, constitute an independent circuit. The number of connections that may be established with n lines is therefore equal to the number of possible pairs of combinations these lines are susceptible of. If there be, for instance, three lines, 1, 2, 3, the lines 1 and 2, 1 and 3 and 2 and 3, respectively, can be combined to three different pairs of line combinations with the aid of the self-induction coils, so that three pairs of stations are allowed to communicate with each other only on three lines instead of on six. Generally speaking $\frac{n\ (n-1)}{2}$ pairs of stations may communicate with each other simultaneously on n lines. It is recommended to make the self-induction of the apparatus as low as possible, lest the telephone or telegraph current in this apparatus be weakened or branched out over the high self-induction conductors. The self-induction of the coils should, if possible, be so adjusted that with only two windings the self-induction of one coil produced in one of the windings is sufficient in itself to effect the choking action referred to, as well as to prevent the telephone or telegraph current becoming weakened.

In order to show the mode of operation of this system, patents for which have been taken by the inventor, it is assumed in Fig. 1 that the station 1 is connected with station 4 on the lines 1, 2; this connection should not be interfered with by any talking connection of the other station, nor should it interfere with any conversations going on with the other station. The vibrations of the microphone m_1 are transmitted as usual to the induction coil i_1 of the station I in the secondary telephone circuit, whence they return through the receiver t_1, the winding x_2 of the choking coil b, the conductor 2, the winding x_1 of the choking coil f of the station 4, the receiver t_4, the secondary winding i_4 of the transmitting coil, the winding x_2 of the choking coil f in the station 4, back through the conductors 1 to the winding x_1 of the choking coil b in the station 1, whence it had started. These telephone currents thus flow successively through the two windings of the self-induction coil, the action of which is opposed to each other, so that the currents cannot become weakened to any considerable extent by choking. The current cannot either be branched out into other telephone circuits as the different points of the latter do not present any drop in potential to the currents, or because they can only pass through one winding of the self-induction coil or through both windings in the same direction. There will, therefore, be no transmission of speech to the other station. For the same reason any conversation going on between the two stations 1 and 4 will obviously not be interfered with by conversations from other stations. It may be mentioned that one of the wires could be replaced by a ground connection.

In the place of choking coils having two windings or else in conjunction with such, self-induction coils, including three windings on a common iron core, can also be used. This modified system is illustrated in Fig. 2. Considering the windings $y_1\ y_2\ y_3$ of the triple self-induction coils or current chokers g, h, j, k, l, o, it is essential that the winding y_1 be always wound to the left, while the two others are wound right hand. Both the windings $y_1\ y_3$ and $y_1\ y_3$ together thus constitute each a double wound choking coil, one winding of which is shared by two stations, e. g., 1 2, 1 3, 2 3. The three windings $y_1\ y_2\ y_3$ are arranged on a finely divided iron core. These triple choking coils, which are inserted between the lines 1, 2 and 3, work as follows: When a transmission of telegrams or a conversation takes place between the corresponding stations 1 4, at the two ends of the lines, an undulating or alternating current produced in the outfit s_1 of the station 1 will follow about the following path: winding y_2 of the choking coil g, winding y_1 of the same choking coil, line 1, winding y_1 of the current choker k, winding y_2 of the same choking coil, outfit s_4 of station

Digitized by Google

4. winding y_2 of the current choker 1, winding y_1 of the same choking coil and outfit s_1. The undulating or alternating current thus always passes successively through two winding y_1 y_2 of the equilibrium to one common point, where they are best put to earth (E). In case the number of lines is greater, a correspondingly greater number of windings y_1 upon all or some of the chok-

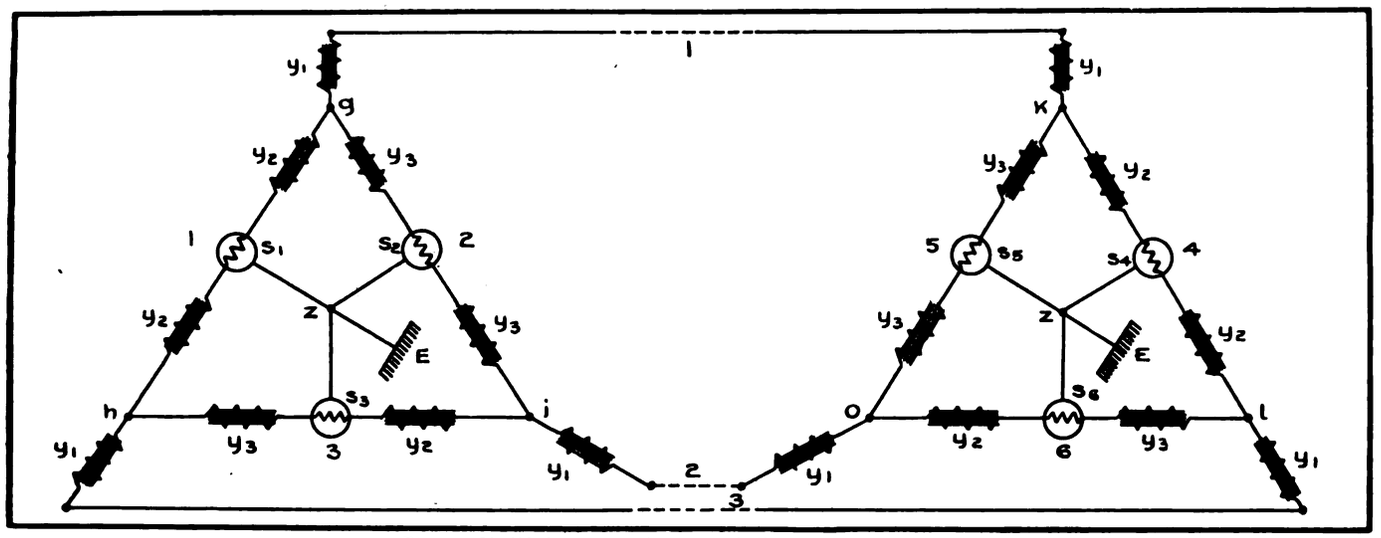

Fig. 2. Modified system using two windings on a common core.

triple current filters, so that the choking effect of all the coils upon the current passing between the two stations 1 4 is entirely compensated for, and there will be no weakening of the conversation or transmission of telegrams between the two stations. The same current cannot, however, penetrate into any other system of instruments, as for these the choking coils are so arranged as to prevent any transmission of current, and the same applies to any telegraph or telephone currents produced in the apparatus of all the other corresponding stations. The station apparatus, s_1 s_2 s_3 or s_4 s_5 s_6 at the other end of the line are connected at their points of electric

ing apparatus should be provided, it being necessary to have in all the lines one of the windings constitute together with one of the other windings y_2 or y_3, a double current choking coil.

The connecting system shown in Fig. 1 can be modified to advantage by arranging two special windings on the same cores acting in opposition in the place of the current chokers a, b, c, d, e, f, g, h; the two special windings being inserted between the apparatus of the station in such a way as to produce a double choking action. The additional winding can be mounted on an iron core, and a similar modification can be made in this system represented in Fig. 2.

Annual Meeting of the Independent Telephone Men of Kansas held at Wichita

THE annual convention of the Kansas Independent Telephone Association was held in Wichita on January 22 and 23. The meeting was largely attended, the secretary of the association stating that between 150 and 200 members were present.

The greatest work accomplished by the association was the adoption of a new constitution and by-laws which enable the local exchanges to form a closer organization in their respective communities.

Little business was transacted at the session held on Monday other than the appointment of a few preliminary committees. The address of the president, A. A. Goddard, of Topeka, was heard, and met with a great deal of favorable comment. An address by W. P. Hemphill, of Topeka, on the subject of "Telephone Revenues" was one of the best that was made before the convention.

A smoker at the Garey Hotel Monday night was tendered the visiting telephone men by the local promoters. Fully two hundred men were present. F. M. Pearl, of Hiawatha, acted as toastmaster.

There was considerable discussion of the advantages conveyed to the State organization by its connection with the National-Interstate Association. Theodore Gary, vice-president of the National-Interstate Association, outlined the work of that organization, and spoke of some of its plans for future development.

The committee on revision of constitution and by-laws, which was appointed at the first session, consisted of W. H. Nelson, of Smith Center; J. E. Byers, of Ottawa; J. C. O. Morse, of Wichita, and W. P. Hemphill, of Topeka. The new by-laws adopted were drawn with the view of forming a more perfect organization between the small local exchanges. The State is divided into six districts, each in charge of a vice-president. The first four districts correspond to the congressional districts bearing the same number. The fifth district consists of the fifth and sixth congressional districts, and the sixth district consists of the seventh and eighth congressional districts.

The following officers were elected for the ensuing year: President, William Nelson, Smith Center; district vice-presidents, first district, C. E. Betts, Atchison; second district, W. Miller, Olathe; third district, A. E. Herzberg, Independence; fourth district, Charles Henderson, Alma; fifth district, John Doyle; sixth district, C. C. Vandeventer, Kingman; secretary and treasurer, F. M. Pearl, Hiawatha; H. D. McVay, of Wichita, was elected a member of the advisory committee for the national committee.

The president was authorized to appoint delegates to the national convention to be held in St. Louis in June as soon as the representation allowed Kansas in the convention was ascertained. The rules allow one delegate for each 10,000 telephones in the State, but as the secretary had not completed his collections and did not know exactly how many units would be represented the matter was left in the president's hands to attend to at a future date.

The selection of a meeting place for the next annual convention was left in the hands of the executive committee.

William Nelson, the newly-elected president, appointed the following executive committeemen: J. E. Byers, Ottawa; A. P. Rogers, Beloit; Harry Camman, Winfield; R. M. Emery, Seneca, and C. S. Brown, Abilene.

Among the representatives of the different companies from the various parts of the State who were present at the meeting were: W. G. Miller, Citizens' Telephone Company, Atlanta; F. W.

Mackey, Columbian Electrical Company, St. Joseph, Mo.; Homer Caldwell, United Electrical Company, Wichita; A. B. Clarke, Herrington Telephone Company, Herrington; J. W. Smith and F. S. Flint, Minneapolis Telephone Exchange, Minneapolis; R. M. Emery, Seneca Telephone Company, Seneca; C. C. Raymond, Lindsborg Telephone Company, Lindsborg; R. H. Shore, Winchester Telephone and Electric Company, Winchester; T. H. Youmans, Ossawatomie Telephone Company, Ossawatomie; S. H. Williams, Southwestern Telephone Company, Mead; Frank Lanley, Stafford Telephone Company, Stafford; E. B. Kellan, Chase County Telephone Company, Cottonwood Falls; R. C. Hall, Ellis Telephone Company, Ellis; J. A. Zimmerman, Valley Falls Telephone Company, Valley Falls; J. C. Kelsey, Chicago; J. C. Valentine, Northern Kansas Telephone Company, Effingham; J. T. Elder, Home Telephone and Electric Company, Cunningham; C. E. Betts, Atchison; C. C. Vandeventer, Kingman Independent Telephone Company, Kingman; F. M. Pearl, A. J. Stevens and Felix O'Neel, Northeast Kansas Telephone Company, Hiawatha; C. S. Safford, Stromberg-Carlson Telephone Manufacturing Company; W. P. Hemphill, Independent Telephone Company, Topeka; W. R. Pettijohn, Hoyt Telephone Company, Hoyt; George W. Watson, Kingsley Telephone Company, Kingsley; W. W. Dilworth, Soloman Valley Telephone Company, Beloit; W. H. Wilson, Exchange Telephone Company, Smith Center; D. D. Brunwell and J. N. Doyle, Belleville Independent Telephone Company, Belleville; C. A. Starr and B. F. Bess, Pratt; C. B. Anderson, Waubausee Telephone Company, Alma; C. H. Cornwall, R. M. Cornwall and G. Z. Taylor, Mount Hope Telephone Company, Mount Hope; F. A. Gresham, Home Telephone Company, Bucklam; C. J. Rich, Havalan Telephone Company, Havalan.

The companies which had exhibits were: The Ewing-Merkle Electrical Company, St. Louis, Mo.; Frank B. Cook & Company, Chicago; Dean Electric Company, Elyria, O.; Sterling Electric Company; American Electric Telephone Company; the Vought-Berger Company, La Crosse, Wis.; Columbus Electrical Company, St. Joseph, Mo.; Kellogg Switchboard and Supply Company; American Steel and Wire Company; Baldwin Electric Company, Kansas City; Monarch Telephone Manufacturing Company; Chicago Telephone and Supply Company, Elkhart, Ind.; the B. R. Electric Company of Kansas City, and the United Electrical Company of Wichita. The exhibits covered a very comprehensive line and attracted much attention.

Address of President Goddard

A. A. GODDARD, president of the association, after a short review of the position of the Independent companies, spoke substantially as follows:

"For the address, which it is my duty to make as president of this association, I have chosen the subject 'What have we got? and what shall we do with it?' Dividing my text, I take up first 'What have we got?' and, answering the question myself, say we have got one of the best business propositions in the country. The telephone business is new, younger than any of us. The instrument was first a toy, and then a convenience, and now it is a necessity. The steam engine, the railroads, the telegraph, do not come so close to the everyday lives of the public as does the telephone. You have noticed how rarely a person ever dispenses with the use of one after being once accustomed to it. The business man never quits. The family that has a telephone, if it meets hard times, will cut out the summer vacation, reduce wearing apparel and living expenses generally before it abandons its telephone service. It appeals more and more to all classes of society. The service is growing better, the rates are reasonable, perhaps too low, and the cry of every telephone company in the land is that the growth of its property is overwhelming.

"In experience we find that people usually pay for a thing all that it is reasonably and fairly worth; and they do this without complaining. It will be found the same with the telephone service. People will be willing to pay a fair price for what they receive if they are only given to understand that the consideration is a reasonable one. It is best in dealing with the public to be frank and honest. When the people understand what depreciation means in telephone business and have a general knowledge of the cost of operating and maintaining a telephone exchange they will not complain of the rates. In cases where rates are too low to be remunerative, a fair amount of education should make it possible to raise the rates. This has been done in a good many instances without the loss of a single subscriber. It is necessary in such cases to be very frank with the public and explain fully that the business cannot be carried on and good service maintained at the going rates.

"I believe that the telephone business is generally more profitable than the average business occupation throughout the State, but in order to get the best out of any business it must have careful, thorough and alert management. The telephone manager should study his business as hard as he can, giving thoughtful attention to all its details and its every relation with the public if he would get the best results.

"When you have got your telephone plant, what will you do with it? It is constructed for the ostensible purpose of serving patrons. You and your associates have invested your money in the proposition for what it will earn. You then use the plant to furnish service to the subscribers and earn dividends for the stockholders. In order to furnish good service you must have a good plant, properly handled. It is necessary that the instruments be in first-class working order and they be kept so at all times. It is also necessary that the operators be prompt, courteous and accurate. In order to keep the plant in proper condition it is of the greatest importance that the primary construction should be of the best; that all repairs and replacements be made in such manner that they will not weaken the service and that the work need not be done again for as long a time as possible. It is frequently difficult to get good operators, and more difficult to keep those you do get continuously active and alert in the performance of their duty.

"The subscriber who has never seen the inside of a telephone exchange has small idea of the difficulties attending good service. Here again it is valuable to take the public into your confidence; invite them to the exchange to see a busy switchboard and the trouble which the operators have. The better they are acquainted with the business the more charity they will have for the operators and the better feeling they should have for the management. The manager who is keen to keep his service up to the best possible state and to keep the public friendly toward the company is performing an invaluable service for the stockholder, while the manager who is grouchy with the public and who cannot manage the operators and keep them courteous to the patrons should be discharged at once.

"So much for the question of service. We now come to the question of profits, and at the outset let me say that the account which is the greatest hindrance to the distribution of profits in the telephone business is the maintenance account if properly kept. If the construction, in the first place, is heavy, leaving a large margin above safety, it is economy. If the repairs are equally heavy and substantial, that is also economy. I am aware, and some of you are painfully so, that there has been a good deal of poor construction in this State, but the plants can be gradually built up, strengthened and improved until they are made right and the mistakes corrected. The maintenance account does not show its ugly head very early in the beginning of the business, but it usually is abundantly in evidence later on.

"I think it is generally customary for telephone companies to put all their net profits into construction. This is frequently a mistake. Capital invested should receive dividends as the business progresses. Your stockholders will be better pleased by the payment of one dollar in dividends than they will if you tell them

Digitized by Google

that the plant has increased in value two dollars. But you say, 'Where is the money to come from?' You say if there were no construction we could pay good dividends, but so many people are ordering telephones, and the business is growing so it takes every dollar we can scrape together. A plant that is trying to carry its construction out of net earnings is very apt to get in debt and have its business handicapped thereby. There is plenty of money in every community to own and build all the telephone lines that are needed in that community, but before money will be invested in such propositions people must be convinced that the investment is a good one. If you have a few stockholders in your company to which you have paid dividends regularly for a few years, they will, if your business looks right, want some more stock for themselves or their friends, and they will tell people that your stock is good. Suppose you own 75 per cent. of the stock yourself, and 25 per cent. of it is outstanding among your people. You want your profits to be kept in the company. If you have a margin of unsold stock and declare a dividend by which you receive a considerable sum of money, and the other stockholders smaller sums, you can reinvest your dividend in additional stock of the company, and it will be much easier for you to sell more stock outside, or dispose of your stock if you so desire, if it is known that the same has been receiving dividends. So long as the maintenance and depreciation are provided for out of the earnings of the company and the moneys received from the sales of the stock go into additions to the plant, the increase of capitalization is not only legitimate and proper, but it puts the plant and the business in a better financial shape for handling.

"Telephone people and companies should understand that if a company has a plant worth $50,000 and earning a good rate of interest that it will be difficult to sell it for $50,000 if you have only $25,000 of stock outstanding. Now, don't understand me as favoring over-capitalization, but I do mean to say that a corporation should, in the interests of its stockholders, have out as much capital as will equal the net value of its properties, and it will be found that it will be easier to sell the property if it is to be sold outright or in parcels. It will be easier in the case of a merger of telephone interests, which is something you may expect in this state, and it will be easier to borrow and obtain credit if the corporation is capitalized at the proper amount.

(To be continued.)

THE CHICAGO ELECTRICAL SHOW.

NO better opportunity to note the vast progress of the electrical business was ever afforded than by the exhibition held at the Coliseum in Chicago from January 15th to the 29th. At every turn the visitor was confronted with new and novel uses for electric current, and at those exhibits where the well-known applications were demonstrated the increased perfection of the apparatus was a continued source of wonder and comment.

The exhibition opened on the 15th, and from then on to the close not a day passed but some interesting event took place. A wireless message from President Roosevelt was received through the apparatus of the De Forest Wireless Telegraph Company at 8 o'clock on the opening night. C. H. Thordarson demonstrated the properties of high tension spark discharges and Professor Clarke gave a spectacular exhibition of high frequency discharges employing exceptionally large Rhumkorff coils.

The light and power companies of Chicago had on exhibition a number of devices for home use employing electric current. These included heating and cooking appliances of all descriptions and a complete kitchen equipment in full operation demonstrated the usefulness of the apparatus.

An interesting feature of the exhibition was College Row. Here the leading schools and universities of the Central States displayed in an attractive manner photographs of the buildings and grounds and products of their laboratories. The Armour Institute of Technology and the Universities of Wisconsin, Colorado and Purdue were represented, and a large number of their students visited the exhibition.

January 17th was observed as Franklin day, it being the bicentenary of that famous scientist's birth. In commemoration of the occasion bronze medallions were distributed by the company. January 23, 24, 25 were designated as Independent telephone days, and on these dates large numbers of operators and managers visited the exhibition and held informal conferences. The general opinion appears to be that the Independent movement will receive the greatest impetus, to its development this year that it has ever known.

Among the exhibitors of telephone apparatus and supplies were the Automatic Electric Company, which had an interesting exhibit of its automatic exchange in operation; the Belden Manufacturing Company, Chicago, showing many varieties of magnet wire; the Electric Appliance Company, Chicago, with a general exhibit of supplies and apparatus; the National Carbon Company, Cleveland, displayed a full line of dry and wet cells; the Sandwich Pole Changer Company, of Sandwich, Ill., had an exhibit of its pole exchanger and duplexer, and the Stromberg-Carlson Telephone Manufacturing Company exhibited a complete line of magneto and common battery apparatus. Amongst the battery manufacturers were the Electric Storage Battery Company, of Philadelphia, and General Storage Battery Company. Roth Brothers & Co. exhibited power apparatus for telephone exchanges and caused a considerable amount of comment by its interesting display.

Music for the entertainment of the visitors was furnished by Weil's band, of St. Louis. Every afternoon and evening attractive programmes were rendered, which greatly added to the interest of the show. The telephone exhibits were always surrounded by large crowds of spectators, and the lively interest shown in the development of the apparatus proved very conclusively that this branch of electrical engineering is one which is being very carefully watched. In every way the exhibition was a grand success and the extraordinary number of out-of-town visitors who attended the show not only evidenced a lively interest in the exhibits, but also either directly or indirectly resulted in the placing of many orders for electrical apparatus of all descriptions.

INDIANA TELEPHONE MEN OF THE EIGHTH DISTRICT MEET AT RICHMOND.

THE third quarterly meeting of the Eighth District of the Indiana Independent Telephone Association was held at Richmond January 24. Representatives were present from every county and a majority of the Independent telephone companies of the district, together with several visitors from outside.

Mr. A. C. Lindemuth, president of the district organization, and vice-president and member of the executive committee of the State association, presided. Mr. George Watts, of Knightstown, was elected temporary secretary in the absence of C. A. Phelps. The morning session was devoted to the regular order of business, including reports from committees, appointment of new committees and new business. All of the twenty delegates and visitors present were the guests of the Richmond Home Telephone Company at dinner at the Westcott Hotel. At the afternoon session, Mr. W. Gilbert Thompson, general manager of the Home Telephone Company, of Hamilton, Ohio, read a very interesting paper on "Two Independent Telephone Companies as an Investment, and Their Management," the two companies referred to in the paper being the Valley Telephone Company, with seven exchanges, operating in Warren and Trumbull counties, and the Home Telephone Company, operating at Hamilton and throughout Butler County, Ohio, both being under one management. The paper clearly demonstrated that Independent telephone companies, established even under the most unfavorable conditions, can be made to pay dividends and placed on a solid basis if right business methods are employed. Mr. Wm. M. Bailey, superintendent of the Richmond Home Telephone Company, read a paper entitled "How Can We Improve Our Local Telephone Service," in which he discussed the relative speed of service through common battery and local battery magneto calling systems. His paper indicated a comprehensive and practical knowledge of the entire conditions that make for better service. Both of the above papers were well received and brought out a spirited discussion.

THE EDITOR'S PAGE

THE TELEPHONE IN REPORTING.

AN interesting illustration of the manner in which the telephone assists in the development of another branch of public service is given in its extensive use by modern newspapers.

The furnishing of news to the public imposes no demand upon its gatherers, with the exception of the single quality of accuracy, which is more important than the necessity for speedy transmission. The success of a paper in selling its story of a matter of large interest may depend upon its getting the issue upon the street or to the railway station only a few minutes ahead of its rivals. To do this the most strenuous efforts are made by reporters to utilize every possible means of saving time in reaching the scene of action. Once on the ground all men are likely to be on comparatively equal terms and the facts are quickly gathered. The next step in the old method of getting the story to headquarters was to hurry to a telegraph station. Now, however, the almost universal use of the telephone has made it possible for a man to get in touch with the home office from almost any region. Many newspapers have experts seated at typewriters and provided with a telephone instrument. Wearing a head receiver, these operators take the story as rapidly as it can be given by the man at the distant end of the line. In this way a saving of time is effected by the cutting out of many items which caused delay in the transmission of messages by telegraph. These not only include the amount gained through the wide distribution of telephone instruments which may be connected to long distance lines, but a saving in time in operating which produces a material gain. Such messages, also, are nearly complete, and require a comparatively small amount of revision. The big daily papers are enabled in this manner to place before their readers important news after an almost incredibly brief interval.

Even the farmers' lines are frequently brought into use for this class of work. A recent instance of this sort occurred in the Southwest. A fugitive from justice was being pursued across open country and public interest in the chase was so intense that the newspapers issued frequent bulletins giving the details of its progress. The news was secured by means of telephones located in different houses passed by the sheriff's party with whom the reporters were traveling.

In the handling of items of minor importance, such as local news in cities of considerable size, the telephone also performs an important service. Each man engaged on this class of work may start out with a single assignment. As soon as he has looked up the facts he goes to the nearest telephone and dictates his report to an operator at the office end of the wire who writes the story. The reporter is then ready to receive another assignment. The advantage of this lies not only in the gaining of time on each report, but in the fact that the office is almost constantly in touch with each man. On receiving notification of an event of importance it is possible to place the right man on the ground in the shortest possible time.

Papers in smaller towns are extending the scope of their news in a manner which will do much to assist in their competition with the newspapers in the large cities which have an extensive outside circulation. A long distance company in Indiana is permitting the use of its lines for the transmission to papers in this class of news of national interest, embodied in a special service derived from one of the great central bureaus. In this way the local paper which receives this service is enabled to place in the hands of its readers, some hours before the arrival of the paper from a large city, the news of events which it could afford to obtain in no other way than by telephone.

For direct communication between persons in different places the unapproached value of the telephone has long been conceded. Its establishment as one of the steps in the chain by means of which most important events are made known to the public now seems secure. We may expect that the time is not far distant when every paper will display as one of its chief claims for patronage the words "News receved by telephone."

IMPROPER USES OF THE TELEPHONE.

THAT disadvantages can be found in almost every class of public service is a well-known fact, and it seems that the telephone is no exception to the rule. A recent case in point came up in a Boston court, and it was so novel that the report has been widely copied by the daily press throughout the country. It seems that the wife of a much-occupied business man was in the habit of calling him up many times in the course of a day, causing interruptions of his work by her conversations about matters which he considered of minor importance. After all the home remedies had failed this much annoyed individual seems to have been determined to take the most effective measures, for he applied to the court for an injunction.

This is a desperate case, but is by no means single, as far as its cause is concerned, even in the same locality. Reports have been known to come from exchanges in the suburbs which indicated that many unnecessary conversations passed over the lines to that city in the course of a day. For instance, one well-known business man was accustomed to receive a call from his country residence located some thirty miles from town every morning, shortly after his arrival, and in the afternoon a second was quite likely to follow. It is said that the first call usually was taken up with an inquiry as to whether he had mailed the family's letters. It may be that things of this sort are quite sufficient to account for the demand for a strictly secret service that is said to be so strong in some quarters.

This question of the use of the telephone for unimportant conversations seems, however, to be a matter not confined to any particular locality. A man in Portland, Ore., has put himself in the same class with the Boston objector. In this case the trouble did not happen to be a strictly personal annoyance. The man had no complaint against the telephone as a receiving instrument, but at his home conditions were different. The telephone was treated as a toy which must be kept constantly in use. The number of unimportant messages from this instrument must have been so great as to exercise a sensible effect on the average rate of calling for the exchange in question, for the aggrieved individual thought it called for a public announcement of his sense of wrong. This was an instance where the telephone was so fascinating that all home duties were neglected in order that the new game might be played to the utmost.

There is a serious feature in all this, which lies in the fact that the use of a telephone system for trivial purposes puts an unjust burden upon not only the company which furnishes the service, but upon the public at large. Every unnecessary message puts the same burden upon the operating force as a serious one, is sure to increase the number of busy reports, and otherwise injures the efficiency of service. Moreover they seldom bring any return to the company which bears the burden of handling the work. The limiting of the number of such connections affords one of the chief arguments in favor of the measured service plan of making charges.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

COMPULSORY USE OF CONDUITS.

We presume this is an old question, but would like to know if there are any cases that hold that a city cannot compel a telephone company to use public conduits in the street. T. P.

WE do not know of any rulings to that effect. The consensus of opinion is that the company can be compelled to use the conduit since it is presumed that the municipal officers will make proper regulations for the use of a conduit by different companies, which are expected to use the same jointly. Geneva v. Geneva Telephone Company, 30 Misc., 236, 62 N. Y. C. 172.

FREE TELEPHONES IN NEW CITY BUILDING.

Our company in its franchise agreed to give free telephones in all buildings belonging to the city which are occupied as police and fire stations. The city tore down one of its old buildings and erected a new one in its place. The instruments we now furnish are much improved and more complicated than those we used at the time our charter was procured. Are we required to put our instruments in the new station? The city also contemplates putting up a new building in a place where there never was any before. Must we provide this building also with a telephone? J. C.

IT is the editor's opinion that your company could be required to furnish a telephone for the new building, which has been erected as a substitute for the old building, but he does not think that you could be required to install a telephone in a building that was not in existence, nor in the contemplation of the parties to your franchise when it was granted. See Kensington Electric Co. v. Philadelphia, 187 Penn. St., 41, A, 409.

PERIOD OF EXCLUSIVENESS.

Our company's franchise provides that it shall be exclusive as against all other companies for a period until, from its earnings, it shall have realized and divided among its stockholders for five years a dividend of eight per cent. Five years have elapsed and up to the present time our profits have somewhat exceeded fifty per cent. in all, but they have been invested entirely in improvements and have not been set apart at all as dividends. The city authorities claim that our period of exclusiveness has passed and that they are at liberty to grant a franchise to a company that wishes to compete with us. Please give us what light you can on the subject. E. L. J.

THE courts have held that such a period of exclusiveness as you mentioned is not terminated by the fact that your profits have exceeded the amount mentioned, where they have been invested in improving your system and not in paying dividends to the stockholders. It is the idea of the courts that the franchise should be strictly construed. See Wilkesbarre Electric Light Company v. Wilkesbarre Light Company, 4 Kulp (Pa.) 47. The point to be on your guard against is whether the council or authorities who granted you your exclusive franchise had authority to do so.

THE CUMBERLAND COMPANY A TRESPASSER.

THE last prop has been knocked out from under the Cumberland Telephone Company at Evansville, Ind., by the decision of the United States Court of Appeals, which, in affirming the District Court of Indiana, holds that the Cumberland company is absolutely without right in the streets of the city and a trespasser. The court thereupon dissolved the injunction that had been in force and there is nothing now to prevent the city from ousting the company from the city. There is no right of appeal in this case except on a writ of certiorari to review the facts in the case. This will not be done.

The Cumberland Telephone Company has been at loggerheads with the city of Evansville for twenty years. The case just decided is of long standing. In 1887 a franchise was presented to the Board of Public Works by the Cumberland company, and a resolution was passed affirming this franchise. The franchise provided that after fifteen years, if the city saw fit, the franchise could be revoked. The contention arose that the city could revoke the franchise in 1902, the expiration of the fifteen years. On Jan. 3, 1902, the Board of Public Works passed a resolution to revoke the franchise when the time came and they presented this resolution to the council for ratification. It was speedily ratified and signed by the mayor. At this juncture the company submitted a draft of a new franchise and asked its adoption. The franchise presented recited that the new one would go into effect at the expiration of the 1887 franchise. In this franchise the Cumberland company offered the city $10,000 and free telephone service for a twenty-five-year lease. This was signed by the Board of Public Works, but the council refused to ratify it. Litigation was commenced. Fearing that the poles and wires would be cut as was done in 1886, the company brought suit for a restraining order. In its complaint the company claimed that it had never operated under the 1887 franchise, but had been since that time operating under a franchise assigned to it in 1882 by the Evansville Telephone Exchange Company, a local concern.

After the suit was in court and the company foresaw defeat, it offered the city $100,000 and free telephone service, underground wire system and all modern improvements for a forty-year franchise. This was refused because the length of time was greater than the city could allow.

Judge Anderson, of the District Court, held the company was without franchise rights and the company appealed. During the appeal, which continued the restraining order, Judge Anderson prohibited the Cumberland Telephone Company from making any changes in its system in the city without first gaining the permission of the Board of Public Works. Now that the decision is in favor of the city the Cumberland company is on the same footing with the Pocket Independent Telephone Company, or any other company that may ask for a franchise. That the city of Evansville is in a position to grant a franchise to an applicant on most favorable terms is admitted. The Independents believe a favorable opportunity is at hand to get a foothold in Evansville, and it is likely that they will seize the opening.

ALL MEMBERS OF AN INCORPORATED COMPANY MUST SUE.

ACTION was brought by E. P. Webster at Sioux City, Ia., against E. P. Spalding to recover a telephone valued at $6.50, which was one of twenty used in connection with a farmer's line at Glen Ellen. The telephone was originally owned by Mrs. A. S. Gillette, who was one of the original members of the company. Mr. Webster was the responsible head of the company and was instrumental in organizing the company. Mrs. Gillette sold her farm, and when Mr. Webster came to claim the telephone Mr. Spalding, the new owner of the place, insisted that the telephone was a part of the property and rightfully belonged to him and his estate. The suit was decided against the plaintiff on the ground that the company was an unincorporated voluntary association and that it was necessary in such case to make all of the parties plaintiffs. No one member could maintain the action.

QUERIES

BRANCH EXCHANGE TROUBLE.—(652.)

A branch exchange of the type using the circuit which I forward herewith is supplied with current from the central office battery over wires in cable. Sometimes the fuses at the central office in the battery supply leads are blown. In this case the relay on any cord circuit at the branch exchange buzzes as soon as the operator plugs into a central office jack, and it is impossible to use the circuit until a special key is operated. Will you please explain the cause of this trouble? C. R.

The current for the branch exchange is supplied from the central office over a pair of wires R, S.

The — side of the branch exchange battery goes to the winding F of the relay, and through this winding to the sleeve of the plug. On the insertion of a plug in a jack connected with a central office trunk with the key I in its normal, or closed position, current flows from the negative side of the battery through the relay, winding F, sleeve of plug G, sleeve of jack H, and key I, to ground, J, operating the relay and cutting off branch exchange battery from the cord circuit. The operation of the relay is thus seen to be due to the passage of current from the negative side of the battery to ground through the circuit indicated.

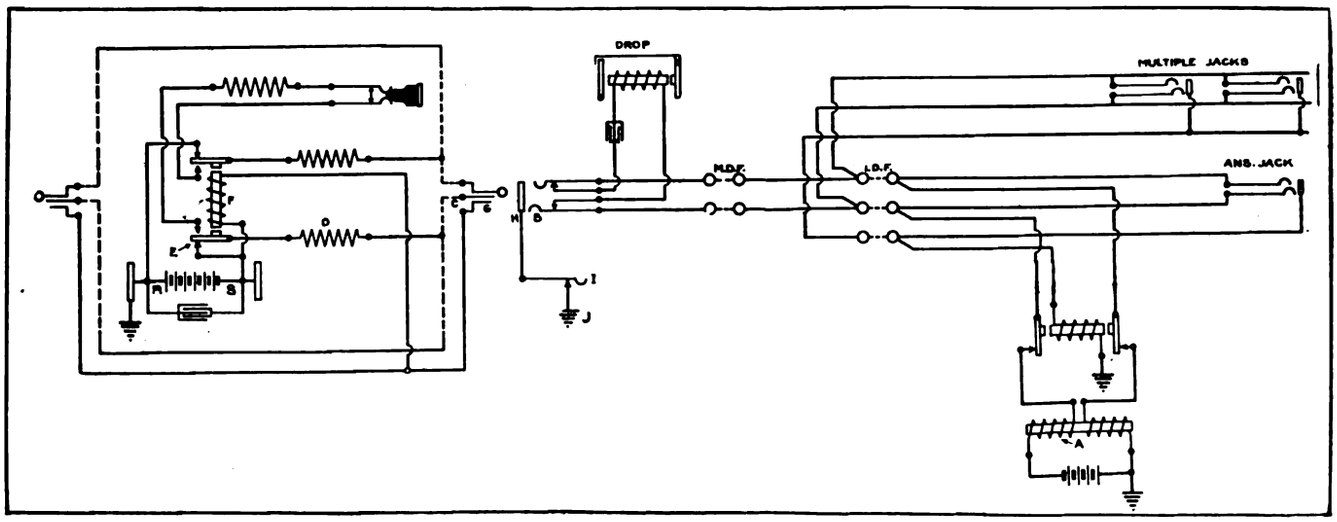

Fig. 652.

In case of the rupture of a fuse in battery leads R, S, at the central office, when a cord is connected to a trunk line there will still be a path from the exchange battery through winding A of the line relay, ring side of line, ring of branch exchange jack B, ring of branch exchange plug C, winding of retardation coil D, contact E, winding of relay and thence to ground as before. On the operation of the relay, however, with the consequent breaking of contact E, current ceases to flow through its winding and the armature falls back. The operation is then repeated, and the result is a continuous buzzing of the relay. Formerly branch exchange circuits were not provided with the key I. On the modern circuits in which this key is used its operation breaks the circuit to ground, prevents the buzzing of the relay, and permits the operator to call and talk with the central office in the usual manner. On account of the special function assigned to it this is frequently known as the "Emergency key."

TESTING BY LOSS OF CHARGE METHOD.—(653.)

Will you please make plain the insulation test of underground cables by Loss of Charge Method, giving an example? Is this method accurate enough for all practical purposes? J. T. E.

The value of an insulation resistance by loss of charge method is determined by measuring the proportion of the charge which leaks out of a known capacity in a given number of seconds through its insulation resistance. The formula is as follows:

Let c = capacity of cable conductor in microfarads,
t = number of seconds charge is allowed to leak,
d = deflection of galvanometer when capacity is discharged through it without being given any time to leak,
d^1 = deflection of galvanometer when capacity is discharged through it after being allowed to leak t seconds,
x = insulation resistance in megohms,

then

$$x = \frac{t}{c \times 2.3 \times \log_{10} \frac{d}{d^1}}$$

For example, let us suppose a single conductor in a cable one-half mile long whose capacity is .04 microfarad to ground. A grounded battery of sufficient strength to give an easily readable deflection is applied to this conductor. It is then removed and immediately the conductor is put to ground through the galvanometer and the momentary deflection noted. Let us assume this to be 10 divisions.

The battery is then again applied and removed. The time of removal is noted, and after 23 seconds have elapsed, the conductor is again discharged through the galvanometer. Let us assume this to show five divisions.

From the formula this gives us

$$x = \frac{23}{.04 \times 2.3 \times \log_{10} \frac{10}{5}}$$

$$= \frac{23}{.04 \times 23 \times .301} = 830 + \text{ megohms}$$

The accuracy of this method is largely dependent on the accuracy with which the momentary throws of the galvanometer may be read and on the proportionality of its scale.

Great accuracy in these measurements is not of great value since the insulation resistance is generally partially composed of a moisture leak which of itself is of a more or less variable nature.

In general the method is only of practical utility where the tester desires to arrive at an idea of the approximate value of an insulation which is too great to show an indication on any of his regular measuring instruments.

Results having an accuracy of about 10% may be obtained by this method, using the ordinary needle type of D'Arsonval galvanometer having a sensibility of half a megohm, and which are usually furnished with bridge sets.

IN THE OPERATING FIELD

ITHACA INDEPENDENT COMPANY DISPLACES BELL IN SEVERAL NEW YORK TOWNS.

THE Ithaca Telephone Company has recently completed arrangements for connections with several smaller companies which have broken off their association with the Bell company for this purpose. The companies included in this extension of Independent service are those operating in the towns of Newfield, Enfield, Trumbull Corners, Hector, Ulysses, Burdette, Mecklenburg and the surrounding territory adjacent to these centers.

The Ithaca company will control the only lines running into these places. The wires of the Bell company, which have heretofore been connected with the exchanges, were cut in order that the connections might be made with the Ithaca company.

Manager R. B. Fegan of the Ithaca company has avowed his intention of making Tompkins the banner county of the Independent lines, and has already done much toward the accomplishment of his purpose.

The business of the company has grown rapidly, 231 telephones having been added to the list of subscribers in the city alone during the past three months.

Preparations are being made to carry on a campaign of enlargement and improvement. Three cars of conduit, two cars of cables and one car of three-inch iron pipe are at hand for the extension of the underground plant in Ithaca.

GROWTH OF COMPANY OPERATING RURAL LINES IN PENNSYLVANIA.

AT the annual meeting of the stockholders of the Conestoga Telephone and Telegraph Company recently held in Morgantown, Pa., there were brought out some interesting facts illustrative of the rapid growth possible to a well-conducted rural line company.

This is the pioneer rural telephone company in Berks County. The enterprise was planned in January, 1902, and during the spring and summer was developed through the assistance of the farmers, until more than thirty farmhouses and business places were connected at the end of the year. Since then it has grown rapidly to meet the requirements of the public. Two wires are running to Reading, and Pottstown is connected. A new line is being constructed from Birdsboro to Baumstown and one to Stonetown. About 200 instruments are now in use and two exchanges are in operation, one being located at Morgantown, and the other at Birdsboro. The capital stock of the company has been increased from the original amount of $5,000 to $15,000. This increase has been used in extending the lines, which now cover a considerable extent of territory.

Before the close of the meeting an election was held at which officers for the coming year were chosen as follows: Henry M. Hertzler, president; E. M. Zerr, recording secretary; Stephen H. Mast, treasurer; Jacob Hartz, general manager; H. E. Plank, B. Frank Kurtz and John W. Jacobs, auditors.

TOLEDO INDEPENDENT COMPANY HAS ENCOURAGING LEAD OVER ITS COMPETITOR.

ON New Year's day the Toledo Home Telephone Company had 10,031 telephones in operation. That the Home people are far outstripping the Bell company is clearly evidenced by a comparison of the net increases made by the two companies during the past year. The Home company made a net increase of about 2,500 telephones, while the Bell company did not make half that showing, the exact number being 1,020 for the year. Both companies have an army of solicitors in the field, the Bell company having imported a score of "fighters," but the Home company is so popular that it is hard sledding to get business for the Bell telephones. The Bell people have less than 5,700 telephones in operation, while the Home plant cares for nearly double that number, and it doesn't take a prospective subscriber but a moment to see the broader field for service in subscribing for a Home telephone.

INDEPENDENT COMPANY AT JOHNSTOWN TO IMPROVE ITS SYSTEM.

EXTENSIVE alterations and improvements, to cost about $100,000, have been decided upon by the directors of the Johnstown Telephone Company, of Johnstown, Pa.

When this sum is paid out their properties will represent an investment of nearly $550,000.

Among the extensions planned is one by means of which all the subscribers in the Moxham district will be attached to the main exchange, thus giving them direct communication with the city. The office in the Lorain suburb will be abolished.

Plans have been approved for the installation of a subway system in the Fifth and Sixth wards, which have hitherto been without this device, and additional copper circuit wires to Seward, Lilly and Hooversville. Money for these improvements will be secured by the issuing of additional stock.

The old staff of officers has been re-elected as follows: President, Chas. Griffith; treasurer, P. F. McAneny; secretary and general manager, Edward Schade. The directors are: Charles J. Mayer, H. H. Weaver, P. S. Fisher, John Emmerling, Dr. J. B. Lowman, Wm. H. Smith, James P. Thomas, Charles Griffith and P. F. McAneny.

RAPID GROWTH OF HOME COMPANY OF MERIDIAN, MISS.

LESS than a year ago construction work was started on the plant of the Home Company at Meridian, Miss. In the first telephone directory just issued over 970 local subscribers are listed, which is a remarkable record for a new company operating in a town of this size. Direct out of town service extends to fifty-five points in Mississippi and Alabama. It is interesting to note that the directory is gotten up in a very attractive manner. Besides the regular alphabetical listing there is a business guide which localizes all the different classes of business in the town under descriptive headings such as grocers, doctors, hotels, etc. Every page carries advertising, which undoubtedly greatly assists in reducing the cost of publishing. On the back cover is a time table of the principal trains entering the city.

A unique method of designating party lines is employed. The colors red, white, blue, green are used for the four parties. Thus if a party on line 724 was required, the designating color would be given, in addition to the line number, to enable the operator to signal the right instrument.

GOVERNOR OF NEW YORK DISCUSSES RATE QUESTION.

IN his recent message to the Legislature Governor Higgins gave some views on the subject of high rates for public service which, in view of their source, should be decidedly interesting. He said:

"Private companies control our railroads, telegraphs, telephones, gas and water supplies and other services which have become necessary to the daily lives of many of our citizens. Such companies are quasi-governmental agencies, vested with the sovereign power to condemn private property for their uses. They are permitted to exist because the State delegates to them its own functions for convenience and economy and to promote industrial

Digitized by Google

development. Such corporations should be tolerated only so long as their rates are reasonable and their service prompt and efficient.

"It has been suggested by a learned justice of the Supreme Court of the United States that such companies have not even the constitutional right to a profit on their investments and that, while they cannot be required to do business at a loss, they may be compelled to content themselves with a return equal to the cost of operation and maintenance. So radical a theory has not been adopted, but that it should be declared from the bench of our most eminent and conservative tribunal is a significant suggestion of the power of the people to regulate public service companies, or failing therein, to exercise their functions directly through government—State or local."

This statement, taken into consideration with the recent decision of the Supreme Court whereby the Hudson River Company was compelled in one instance to maintain the lower rate granted by a company which afterward became a sub-licensee, gives an important key to future possibilities in New York State.

INDEPENDENT COMPANY MAKING RAPID PROGRESS IN CITY OF MEXICO.

THE cornerstone of the central exchange building of the New Telephone Company will be laid in a few days, the foundations having now been completed. It will rise to a height of three stories. The building, with the exception of the foundations, which are of stone, will be of steel construction. The exchange will be opened in about three months.

The work of the New Telephone Company during the past year, only six months of which it was engaged in the laying of its underground system, was remarkable in that the estimates that it had made were considerably exceeded. More than half of the entire underground system is now laid. The actual number of duct feet of conduits laid up to the close of the year was 320,000 out of a total number of 600,000 duct feet that the system calls for. The company had not planned on the large number that it succeeded in laying, but, as it had the permission of the government to complete the work as soon as possible, and as it was anxious to make as short as possible the time that the public would be required to wait for its service, it kept the work moving with great rapidity. The same policy will be followed during the present year, and no time will be lost in bringing the whole enterprise to a speedy conclusion.

There were nearly eight kilometers of trenches dug during the time that the company has been at work on the laying of the underground system.

The entire central portion of the city has now been completed and the company is ready to start on the outlying sections. The section of the city embraced within the American colony will be well covered with conduits, and the people of the colony will in a few months have no cause to complain of the lack of telephone facilities. The company has about finished laying its larger conduits containing thirty-seven ducts, and in the outlying districts of the city, where it will now work, the smaller sizes, particularly the four duct conduits, will be employed.

QUINCY, ILLINOIS, TO HAVE IMPORTANT INDEPENDENT TOLL LINES.

ENGINEERS are preparing plans for a number of new lines which will put Quincy Independent subscribers in communication with important outside points.

Charles Wheat, superintendent of the Quincy Home Telephone Company and also of the newly organized Quincy Long Distance Telephone Company has stated that one line will be built to Kansas City to connect with the long distance interests there, while another will be built to Keokuk, where it will connect with the Mississippi Valley Telephone Company's lines, which run to Minneapolis and St. Paul; a third will be built east to connect with the Interstate lines, which will give the local company wires into Indiana and Ohio, and a line will be built to Hannibal and St. Louis, at the latter place having direct connection with the Kinloch system.

It is the understanding at this time that the Postal Telegraph Company will use the Quincy Long Distance Telephone Company's poles and wires between St. Louis and Keokuk and also to Kansas City. The local Postal wires will also be placed underground in the Quincy Home Telephone Company's conduits.

The work on the system in the city of Quincy is being pushed rapidly. The drawing of cables through the underground conduits will be under way inside of the next four or five weeks.

It is the intention of the Home and Long Distance companies to thoroughly cover the local territory and to provide connections with all important outside points.

CONTRIBUTORILY NEGLIGENT IN COMBING HIS HAIR.

AN interesting case recently decided by the Supreme Court of Wisconsin is that of Grant Owen, appellant, vs. the Portage Telephone Company. Owen had taken the disconnected end of a wire belonging to the company and hung it up in the pump house on his farm. While combing his hair before a mirror in the pump house near this coil of wire in 1903 he was struck by a flash of lightning, apparently coming from this coil of wire. He brought suit and was awarded $1,000 damages, but the court held there was "want of ordinary care on the part of the plaintiff, which contributed to the injury." The plaintiff moved to reverse the answer to this part of the decision and, failing in such relief, that the verdict be set aside and a new trial granted. Such motions were overruled and judgment rendered for defendant on the verdict from which plaintiff appealed. The lower court is sustained.

INDIANAPOLIS TELEPHONE COMPANIES MAKE CHANGES IN MANAGEMENT.

THE Indianapolis Telephone Company and the New Long Distance Telephone Company have recently announced important changes in the management. For the Indianapolis Telephone Company, Hon. Harry S. New was elected president; George C. Hitt, vice-president, and also secretary-treasurer, and A. L. Tetu, general manager. The directors are: Harry S. New, J. H. Holliday, Cortland Vancamp, Jesse Fletcher, A. L. Tetu, H. C. Stifel, Jas. S. Brailey, Jr., and A. H. Bauer. With the exception of the last three named all are Indianapolis men.

For the New Long-Distance Telephone Company the following officers were elected: President, H. C. Stifel; first vice-president, H. S. New; second vice-president, George C. Hitt; secretary-treasurer, George C. Hitt; assistant secretary, C. S. Norton; general manager, A. L. Tetu; directors, H. S. New, M. B. Wilson, A. L. Tetu, H. C. Stifel, J. S. Brailey, C. M. Forster, Breckenridge Jones and A. F. Ramsey.

While he will give to the Indianapolis companies the full benefit of his wide experience in the operation of telephone systems, General Manager Tetu will continue to occupy a similar position in the Nashville Home Telephone Company, of which he will still be in active control. The board of officers, as it now stands, is composed of men of recognized ability and useful experience, and the successful working out of the plans they have in view for the development of these properties seems to be assured.

CITIZENS' TELEPHONE COMPANY PLANS FURTHER EXTENSIONS IN WEST VIRGINIA.

THE Citizens' Telephone Company, now operating lines located in the lower end of Wood County and extending over a large portion of Jackson County, is planning still greater developments.

The company operates many rural lines and almost without exception every farmer living along the routes of the lines has a telephone in his home. The subscribers furnish their own poles, place them in position and the telephones are installed for $13. Thereafter the yearly expense is only $1.25 and this is for the repairing of the lines and maintaining of switchboards. Switchboards have been installed at Wadesville and Rockport and the lines have been extended all through the lower section of the country adjacent to the Jackson County line and as far as Lubeck and Mineral Wells, in the direction of Parkersburg.

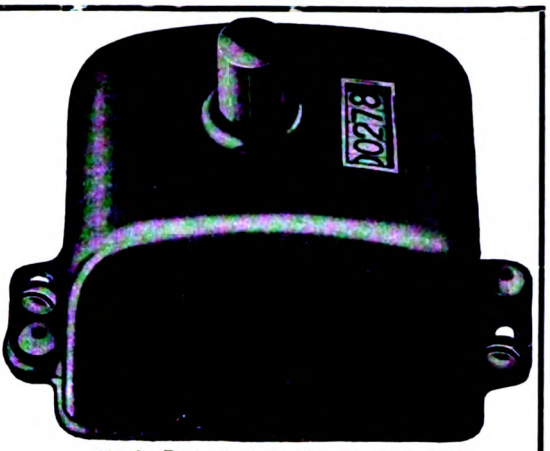
GRAY TELEPHONE PAY STATIONS

NOW READY **1906** CATALOGUE

Illustrating and Describing the Only Automatic and Paying Pay Station Manufactured.

ALSO OUTCLASSING ANYTHING OF ITS KIND EVER ISSUED.

GRAY TEL. PAY STATION CO. Hartford, Conn.



Simply Drop the Coin. No Levers to Pull.

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE, CHEAP—600 pairs self-soldering protectors. Also one 300 pair and one 500 pair main distributing frame, used less than two months. Will sell separately or together. Address Virden Telephone Exchange, Virden, Ill., or Girard Telephone Exchange, Girard, Ill. 420

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

WANTED—Traveling salesman, calling on the telephone trade, who can sell an article used by every large telephone company. Address Box 519, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 519

WANTED—Experienced telephone men of good appearance and address as traveling inspectors for the Engineering Department. We need men to fill vacancies caused by recent promotions. Address George J. Yundt, Engineer, Southern Bell Telephone & Telegraph Company, Atlanta, Ga. 530

WANTED—Position as manager. I am not a technical man but a thorough business man; understand construction work in every detail, know what business is and how to get it; a master of details, quick and accurate in emergencies; thorough in system and discipline. Can "make good" in any position of responsibility where energy, fidelity and brains are needed and appreciated. Let me give you my experience and references. Address Box 533, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 533

WANTED—Continued

WANTED—First-class salesman, calling on the telephone trade, can make big money by selling the best specialty on the market. Address Box 535, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 535

DRAUGHTSMEN—Large Eastern telephone company requires several young draughtsmen who letter well, as tracers and designers on circuit, map, equipment, cable and general draughting. State age, education, experience and salary expected. Enclose a sample of your free hand lettering and of your draughting. Address Box 527, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 527

A SQUARE deal is what we aim to render both employer and employee, when seeking the right man for a place, or the right place for a man. Without effort on your part, without endangering your present position, and without using your employers' time, we hunt up the position for which you are best qualified. Let us find the positon for you. Hapgood's, Suite 511, 309 Broadway, New York City. 464

WANTED—Position as manager of common battery exchange. Practical telephone and good business man. Have good record. Would not consider less than $100 per month. Address Box 526, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 526

WANTED—By a large telephone and switchboard factory, several young men not over twenty-two years of age, to enter its apprenticeship course, where they will be trained to install and operate large modern telephone switchboards. Address, stating age, experience and education, Box 503, care THE AMERICAN TELEPHONE JOURNAL, 116 Nasasu street, New York City. 503

AIBMULOC

There is something wrong with that word. It isn't put together right. If you spell it backwards it will form the word "Columbia," the name of our telephones. It's just the same way with many of the telephones on the market. They have all the parts but they are not put together right. That's where they differ from ours.

When you buy a "Columbia" you get an instrument that is right all the way through.
You don't get a piano finish on the outside and a scrap heap on the inside.
Every part is built for efficient service under all conditions and it stays that way.
We'd like to have you write us for prices, we are sure you will never regret so doing.
We will buy your old telephones and switchboards.

EDISON TELEPHONE CO., 60-68 W. VAN BUREN STREET CHICAGO ILLINOIS

TELEPHONE PATENTS

RINGER.

Elbert Rudolph Hobbs, Lamar, Colorado, patents (No. 809,060, dated Jan. 2, 1906; filed Nov. 10, 1904; serial No. 232,117) a ringer for telephones and the like.

In this invention means are disclosed for improving the mechanical arrangement and adjustment of the parts of a ringer so that without any auxiliary apparatus other than that incorporated in its design it may be made to serve for different signaling processes. Thus adjustments are provided for holding the armature ends equidistant from the poles and also for tilting one end nearer one pole than the other for selective or biased operation.

PARTY LINE SYSTEM.

Frank B. Hall and Arthur F. Poole, Wheeling, W. Va., patent (No. 810,335, dated Jan. 16, 1906; filed Sept. 23, 1901; serial No. 76,154) a party line system.

This invention consists of a means to selectively call any party on a line and to lock out all other parties but the one desired. At the exchange selective mechanism is provided which enables the operator to select and call the party desired. Of the two metallic lines leading to the sub-station one is legged to each instrument and the other is looped into the selective mechanism at each station, although normally open thereat. All sub-stations are provided with ground connections and through the medium of the bridged line and the ground return a subscriber can call the exchange. The operator secures the party desired by joining up the intervening open points in the looped side of the circuit up to and including that station.

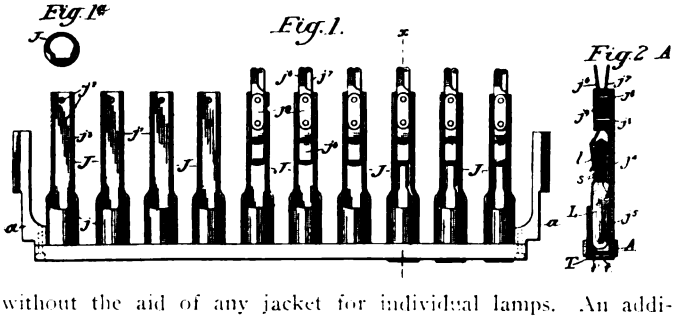
When a receiver is removed from the hook at any station that act automatically locks out all other parties on the line.

The limited space at our disposal will not permit us to fully describe the system and apparatus. All parties further interested in the matter should secure a copy of the patent from the Patent Office.

LAMP JACK.

Sidney A. Beyland, Elyria, Ohio, patents (No. 810,367, dated Jan. 16, 1906; filed November 25, 1904; serial No. 234,293) and assigns to the Dean Electric Company, Elyria, Ohio, a lamp jack for telephone switchboards.

In this invention there is disclosed a design for a lamp jack which will prevent cross illumination from one jack to another



without the aid of any jacket for individual lamps. An additional feature of the design lies in the adaptability of the socket to various methods of mounting, so that one form will be standard for all uses or purposes. Referring to the illustrations, *A* is a rigid front bar of metal which is employed to support the lamp sockets *J* in units of ten or more as desired. The portion of the jack *J* which fits into the supporting plate is formed into a tube which prevents cross illumination from one socket to another. The rear portion j^3 is flattened and has its edges j^4 turned upwards to form a channel. The springs j^5 j^7, together with the necessary insulating material, are attached to the socket by means of screws entering at j^2. The channel formation prevents the springs from twisting out of position and causes the lamp to be held in a secure position so that no portion comes in contact with the interior wall of the socket. This permits ventilation around the lamp bulb. Each jacket is provided with a fibre lining j^4 to prevent any accidental contact between the springs, lamp contacts and the socket.

TELEPHONE DIRECTORY.

Edward N. Lake, Chicago, Ill., patents (No. 807,942, dated Dec. 19, 1905; filed August 22, 1904; serial No. 221,687) a telephone directory.

This device consists of a form of directory which can be readily attached to a telephone instrument. Referring to the illustration, 3 is a bracket which is fastened to a rectangular

Fig. 1.

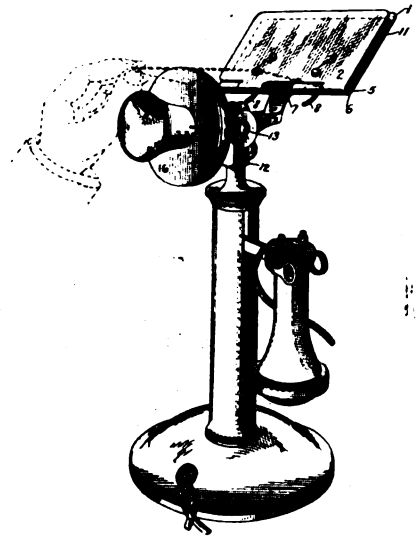


plate 1. This plate, together with plate 2, constitute the covers of the directory, the leaves of which are included and designated by the figures 11. These are held in place by means of semicircular guide rods 8, which pass through holes in the cards or leaves. The front cover is held closed by means of a spiral spring 7, which is carried by a rod which forms the hinge for the covers and is held in position by screw 5. The directory cards can be provided with indexing tabs for ready reference, so that in looking for a number it is only necessary to pull forward upon the indicating tab to disclose the number underneath.

TELEPHONE ATTACHMENT.

Paul Kammerer, Pittsburg, Pa., patents (No. 808,454, dated Dec. 26, 1905; filed Feb. 24, 1905; serial No. 247,126) a telephone attachment.

This consists of a standard or support for attaching a call registering device to a transmitter arm. A clamp in the form of an inverted U is provided with a vertical standard to which a register can be attached. The U formation is intended to be clamped over the arm, so that the registering device may be in plain sight of any person using the instrument.

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

TELEPHONES FOR RESIDENCE SERVICE.

IN telephones designed for intercommunicating purposes, means of securing instruments which shall be both compact and sightly have been given especial attention by the Connecticut Telephone Electric Company, of Meriden, Conn. Upon this page we show two of their well-known instruments. In Fig. 1 is shown a set known by catalogue number as 59 B, designed for residences, etc. This box is designed for the accommodation of a Connecticut automatic switch, having 10 buttons or less. The material used in its construction is either wood, brush brass or brass with a nickel finish. This instrument is to be used for communication between separate rooms in the same building, and arrangements are made for the use of a designation card opposite the button corresponding to each of the lines. The receiver hook is brought out at one corner of the case, while the transmitter is set with its working parts inside the case, only the mouthpiece and front plate being in sight. As the set can be readily placed within a recess in the wall it can be located in many places where it is especially convenient. This would make it available for many locations where a larger cabinet would be objectionable on account of lack of space. It will be observed that the entire set presents a very attractive appearance, and is no larger than is absolutely necessary for the use of a switch having working parts of sufficient size to be reliable.

The second illustration is another instrument designed for residence use, and is especially adapted to concealed work of the highest order. Although the switch is of the well-known Connecticut type, the arrangement is somewhat different from the other instruments. All working parts are fastened to a front plate, which is arranged to be set flush with the face of the wall. As the receiver is of the watch case type, and the gongs are very small, the amount of space in the room occupied by this instrument is inconsiderable. It is furnished with either a wooden plate, or a metal plate with brush brass or nickel finish. The sets are arranged for the use of switches with ten buttons or less.

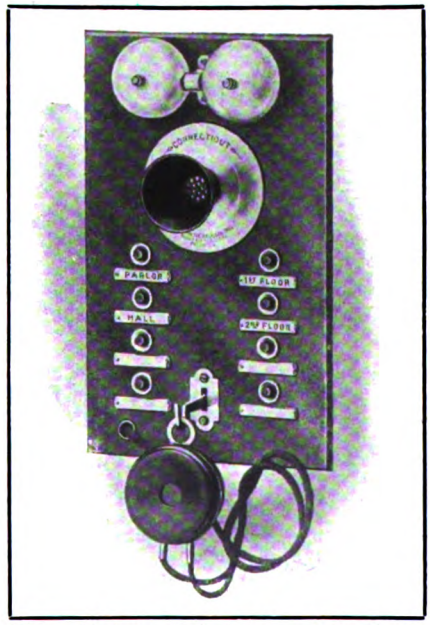

Fig. 2. Flush metal telephone, catalogue No. 54.

Both of these instruments are provided with the standard Connecticut switches, for which the manufacturers claim the highest degree of reliability. For residence use these two types of instruments, and the system of wiring used by the Connecticut company present numerous advantages which will be explained by the manufacturers upon receipt of a request for information.

THE ELECTRIC GAS LIGHTING COMPANY, Boston, Chicago, Toronto and San Francisco, is mailing a folder which illustrates two new types of switchboards for hotel and private branch exchange installations. One of these is called an "annunciphone" and is intended to take the place of a return call annunciator. It is provided with the usual needle indicator. Below are mounted two rows of jacks and sufficient plugs and cords are provided for intercommunication. The transmitter is mounted on the left of the cabinet, as is also the receiver hook. The other board is termed "Rotokoll" and conforms to the usual type of exchange switchboard of the desk type. The jacks and signals are mounted in alternate rows of 30 points each. A strip of jacks is provided for outside service and each pair of cords, of which there are fifteen, has double supervisory signals. The board illustrated has a capacity of 300 lines. On either side of the lower portion of the desk are four drawers, and the desk table is very convenient in arrangement. The transmitter is suspended in the usual way and a head band receiver is provided. This card will be mailed to parties interested and further particulars furnished upon request.

Fig. 1. Automatic flush type, catalogue No. 59 B.

A NEW WIRE MANUFACTURING COMPANY.

ANNOUNCEMENT was made on January 25th of the formation of the Electric Cable Company, of Bridgeport, Conn., which succeeds the Magnet Wire Company and the Peerless Electric Company, both of New York. The company is erecting a large model factory in Bridgeport, where it will manufacture magnet wire, field and armature coils and voltax, the new non-rubber insulation which is now on the market for the first time. The New York office will be at No. 42 Broadway.

The officers of the company are: President, Edwin W. Moore; vice-president, Frederick H. Cowles; treasurer, J. Nelson Shreve; secretary, H. S. Williston. The directors include G. Tracy Rogers, Binghamton, N. Y.; George C. Edwards, Bridgeport, Conn.; Russel A. Cowles, Edwin W. Moore, Frederick H. Cowles, J. Nelson Shreve, H. S. Williston, Alfred Skitt, John Carstensen, all of New York.

THE AMERICAN AUTOMATIC TELEPHONE COMPANY has recently filed its papers of incorporation at Albany, N. Y. The corporation is capitalized for $1,500,000, of which $500,000 is 7 per cent. accumulative preferred stock. Of this amount $650,000 was paid in at the time of the incorporation and since that time a considerable additional amount has been subscribed. The company will manufacture automatic switchboards and telephones. The officers and directors of the company are as follows: President, Senator John Raines, of Canandaigua; vice-president and general manager,

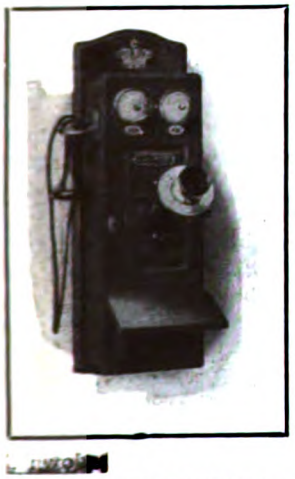
Imitation is the Sincerest Form of Flattery

Because it acknowledges that the article copied is superior to anything that could be designed by the imitator.



EVERBEST telephones are recognized as being representative of telephone perfection.

Consequently, they are imitated.

The main point of difference between the real and the imitation is the GUARANTEE.

EVERBEST TELEPHONES ARE absolutely GUARANTEED against defects of any kind FOREVER.

The imitation gives no such protection.

BULLETIN 36 T WILL TELL YOU ALL ABOUT THE BETTER TELEPHONES.

Ewing-Merkle Electric Company
ST. LOUIS, MO., U. S. A.

Digitized by Google

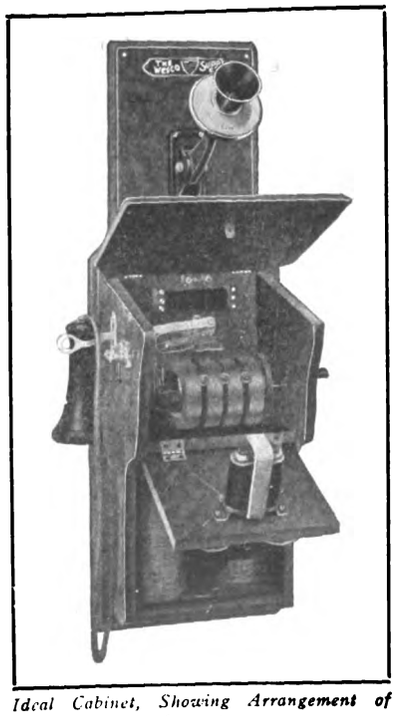
J. W. Lattig, one of the inventors; secretary and treasurer, B. J. Williams, President of the Shelby, Ohio, National Bank; Alvaro L. Thompson, of the firm of Ingmire & Thompson, Rochester, N. Y.; Henry H. Stebbins, Jr., a Rochester business man, and Joseph R. Webster and George R. Raines, of the law firm of Webster, Meade, Straus & Raines. J. W. Lattig and Charles L. Goodrum are the inventors of the system. The new company is now actively engaged in making arrangements for its manufacturing plant and is at the present time purchasing machinery, having its dies and punches made. It hopes to be ready to solicit business within a few weeks.

FASHION IN TELEPHONE CABINETS.

THE telephone has become so thoroughly a utilitarian device and so essentially an every day necessity in business as well as social life, that it would at first seem absurd to attribute to it any of the imaginative or real attributes that give value to a woman's spring bonnet or parosol. Nevertheless it is true that the elusive element of style or fashion has had a place even in the practical commercial field of telephone manufacture.

A few years ago it was quite a thing among Independents to boast of the ownership of an ornate tandem cabinet magneto telephone, and the longer the battery box and the more material used in its construction the greater was the pride of its owner.

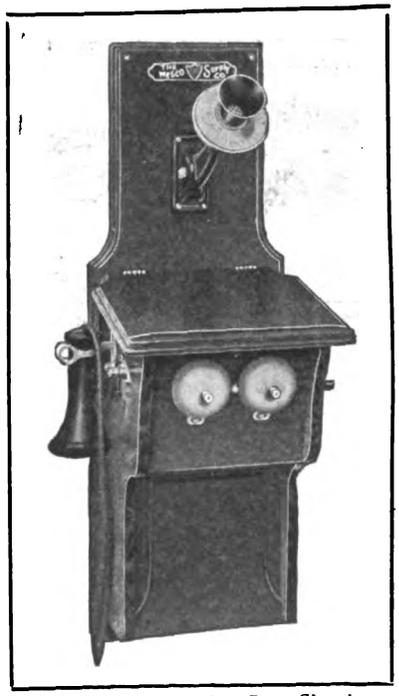
Then came the more practical wide battery box cabinet, so extensively used by the Bell Company and which still has a strong hold upon the fancy of a goodly share of operators and subscribers. Later the compact style cabinet made its appearance, the original design for which is claimed by half a dozen manufacturers and is to-day very widely used in the Independent field.



Ideal Cabinet, Showing Arrangement of Apparatus.

The "Ideal" cabinet is said to have been originally designed and placed on the market by the Wesco Supply Company, of St. Louis, several years ago, but it proved to be a "snow flower" born before its time. Since that time, however, several manufacturers have recognized the commercial value of this cabinet design and have made efforts to introduce it to their trade.

The accompanying illustrations show the "Ideal" magneto telephone as now placed on the market by the Wesco Supply Company. Among its advantages are the facts that the line terminals are inside of the cabinet entering from the rear of the backboard, thus placing these binding posts out of the reach of the user and avoiding the trouble so often experienced by patrons tampering with the line terminals. In this instrument all the wiring is done from the rear of the board and all the parts are firmly secured to the backboard, no shelves being used. Another point in its favor is that the transmitter arm is attached to the backboard, which gives it a solid base and avoids any tendency to vibration.



Ideal Cabinet, with Box Closed.

THE H. H. FRANKLIN COMPANY, Syracuse, N. Y., has recently issued a booklet which illustrates and describes the Franklin die cast process. This consists of casting a part complete, so that no machine work is necessary. All holes are accurate and threads correct. Any other method requires that the casting must be secured in the rough and machined afterwards. A special material, Franklin metal, is employed for this work, which has a fine grain and can take a high polish or a superior nickel plate. These castings can be made from other alloys as well as from aluminum. The dies used are accurate, indestructible, and are capable of producing any number of perfect finished parts. The Franklin process is intended for all small parts which require great accuracy in manufacture. Amongst the parts illustrated are gear wheels of all descriptions, pulleys, special movements, numbering and printing wheels, name plates, end-plates and bearings for telephone generators, etc. This firm also manufactures miniature models for advertising purposes, and is prepared to assemble and ship such apparatus complete. To parties interested in the manufacture of small machinery of any description this booklet will be found of much value. The company will be pleased to send it free and also give further details relative to its die casting process upon request.

INDEPENDENT CIRCUIT PATENTS UPHELD BY COURT.

THE United States Circuit Court of Appeals has recently handed down the decision in the suit of the Western Electric Company vs. the Galesburg Union Telephone Company, which suit involves the common battery multiple circuits known as the Fowler system, which is manufactured by the Sterling Electric Company, of Lafayette, Ind., the Sterling Electric Company having defended these suits. The case has been fought very bitterly for the past three years, the first hearing being before Judge Siemans, of Milwaukee, in the United States Circuit Court at Chicago, his decision being in favor of the Galesburg Union Telephone Company, or the Sterling Electric Company. The case was appealed to the United States Circuit Court of Appeals, where it was again bitterly fought, the Court handing down the decision January 26th, affirming Judge Sieman's opinion.

This is the last court of resort and the Sterling Electric Company makes the statement that so far as its common battery multiple system is concerned, it is the only manufacturer in the Independent telephone field whose patents have been adjudicated and affirmed and it is now in position to furnish users with a system that is free from any possible patent litigation.

CHEAP VS. EFFICIENT SERVICE

The cheapest telephone service in the world is dear at any price if it is not efficient.

When a man installs a telephone he wants to be able to use it and not to abuse it.

A grounded line nine times out of ten is noisy, and foreign noise on a telephone line will arouse a feeling of anger in the heart of the user that isn't good for the company. You can keep your lines free from grounds and other troubles by periodic tests with a Pignolet voltmeter, and when they do occur, you can locate them with this instrument, and get them cleared often before the subscriber knew his line was in trouble.

If you need your subscribers' good will, you need my voltmeter to get it.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit

78 CORTLANDT ST., N. Y.

Please mention THE AMERICAN TELEPHONE JOURNAL when writing to ADVERTISERS.

FINANCIAL.

SYCAMORE, ILL.—The DeKalb County Telephone Company has declared a quarterly dividend of 2 per cent.

BLUE EARTH, MINN.—The Blue Earth Telephone Company has declared a 6 per cent. dividend.

MEYERSDALE, PA.—The Economy Telephone Company has declared a dividend of 5 per cent. The company is to build a line from Pugh to Hooversville and from there to Johnstown.

FRANCHISES.

RIDOTT, ILL.—Mr. Shoemaker has been granted a franchise to build a telephone line in Ridott.

FULTON, N. Y.—Louis W. Emerick has been granted a franchise in Fulton. Mr. Emerick is to organize a telephone company, which will install a modern telephone system.

TUPPER LAKE, N. Y.—The Robinson Telephone Company of Pottsdam has been granted a franchise to build and operate a telephone system at Tupper Lake.

WAHPETON, N. D.—The Tri-State Telephone Company of Minneapolis has been granted a franchise at Wahpeton, and it is expected that Breckenridge will also grant the company a franchise.

GRANBURY, TEX.—The Hood County Independent Telephone Company has been granted a franchise in Granbury.

COMBINATIONS.

CARTHAGE, ILL.—The Mississippi Valley Telephone Company has acquired the Hancock-Houston Telephone System.

NEWPORT, IND.—The Hughes telephone exchanges at Newport, Dana, Hillsdale and Clinton have been consolidated. G. W. Hughes will be president and general manager; Mr. Horney, general superintendent. The name of the new company is the Indiana Telephone and Telegraph Company.

MORRICE, MICH.—The Farmers' telephone lines of Morrice have been united into the West Antrim Telephone Company. Officers have been elected as follows: A. L. Beard, Morrice, president; W. Waters, Antrim, secretary.

NEW PARIS, O.—The Bloom telephone system has been acquired by W. D. Rush. It is composed of two switchboards at New Paris, and lines extending into Richmond, Eaton, New Madison, West Manchester, Eldorado, Cedar Springs and Richmond.

ELECTIONS.

GIRARD, ILL.—The Farmers' Mutual Telephone Company has elected the following officers: President, E. E. Vaniman; vice-president, A. J. Brubaker; secretary, A. A. Neher; treasurer, S. O. Smith; manager, S. S. Brubaker; assistant business manager, H. R. Terry.

PEARL CITY, ILL.—The following officers were elected at a recent meeting of the Pearl City Mutual Telephone Company: President, D. L. Mitchell; treasurer, G. W. Dow; secretary, Henry Meyers.

SULLIVAN, ILL.—The Gays Mutual Telephone Company has elected the following officers: President, J. D. Hardinger; secretary and treasurer, Roy Wilson. The company is arranging for connections with the Sullivan Telephone Exchange.

CAMDEN, IND.—The Camden Telephone Company has elected the following officers: U. E. Tesh, president; E. A. McFarland, vice-president; J. H. Lesh, secretary; Monroe Martin, treasurer.

BLOOMFIELD, IA.—The Citizens' Mutual Telephone Company has elected the following officers: President, C. V. Carroll; vice-president, L. F. Christy; secretary, W. C. Durpie; treasurer, C. D. Evans.

ELDRIDGE, IA.—The Eldridge Telephone Company has elected the following officers: President, F. C. Gaghagen; vice-president, J. B. Crouch; secretary, M. H. Calderwood; treasurer, H. W. Bruhn.

ROLAND, IA.—The Roland Mutual Telephone Company has elected the following officers: President, Dr. E. Rice; vice-president, J. H. Larson; secretary-treasurer, J. H. Jondall.

ADRIAN, MICH.—The Adrian Telephone Company has elected the following officers: D. M. Baker, president; O. Hunt, vice-president; C. S. Park, secretary; G. A. Wilcox, treasurer; F. G. Tyler, manager.

MANKATO, MINN.—The Rapidan-Mankato Telephone Company has re-elected the following officers: F. O. True, president; George Ballard, vice-president; William Jamieson, treasurer; A. L. Viegel, secretary.

VIOLA, MINN.—The Viola Telephone Company has elected the following officers: John Bierbaum, president; George Wood, vice-president; H. A. Doty, secretary-treasurer and general manager.

OZARK, MO.—The Farmers' Rural Telephone Company has elected the following officers: Thomas J. Hanks, president; J. E. Bannett, vice-president; Grant Gooch, secretary; J. T. Deeds, treasurer.

WILTON, N. H.—The Wilton Telephone Company has elected the following officers: President, G. E. Bales; secretary and treasurer, W. H. Emerson; general manager, H. L. Emerson.

EAST MEREDITH, N. Y.—The Farmers' Exchange Telephone Company has elected the following officers: President, O. R. Munson, Meredith; vice-president, C. Burgin, Delhi; secretary and treasurer, J. G. Scudder, W. Meredith.

GREENE, N. Y.—The Greene-Coventry Telephone Company has elected the following directors: Albert Mead, G. O. Williams, P. E. White, H. F. Smith, William Wylie, Frank Drachler, Frank Preston.

ILION, N. Y.—The Herkimer County Telephone Company has elected the following officers: President, James Conkling, Ilion; vice-president, G. R. Fuller, Rochester; secretary, W. I. Taber, Herkimer; treasurer, C. H. Poole, Utica.

MIDDLETOWN, N. Y.—The Middletown Telephone Company has elected the following officers: Directors, M. C. Connor, Edwin Fancher, Galen Coleman, Daniel G. Comings, J. B. Hulett, T. B. Walsh, Charles A. Ketcham, W. C. Ramsdell and George B. Potter.

VAN WERT, O.—The following officers have been elected by the Van Wert Home Telephone Company: President, G. M. Saltzgaver; vice-president, W. G. Edwards; secretary, J. W. Longwell; treasurer, E. W. Leslie.

MORGANTOWN, PA.—The Conestoga Telephone Company held its annual meeting at Morgantown and elected the following officers: President, Henry Hertzler; manager and superintendent, Jacob Hartz; treasurer, Stephen Mast.

YANKTON, S. D.—The Yankton Telephone Company has elected the following officers: E. A. Bruce, president; W. H. Edmonds, vice-president, J. J. Wagner, secretary-treasurer.

SHEBOYGAN, WIS.—The Citizens' Telephone Company has elected the following officers: W. E. Tallmadge, president; Fred Karste, vice-president; Gustave H. Huette, secretary and treasurer.

NEW COMPANIES.

OZARK, ARK.—The Ozark & St. Paul Telephone Company has been incorporated with a capital stock of $5,000. The incorporators are: C. B. Blaylock, Joseph Hill, S. Davis, J. A. Bateman, L. G. Bristow and others. The company will build lines in Franklin and Madison counties.

TOCSIN, IND.—The Tocsin Telephone Company has filed articles of incorporation. The company is capitalized at $10,000 and will operate in the northern part of Wells County, with home office in Tocsin. It takes over the business of a partnership having a large number of telephones in the territory. Extensions will be made and new equipment installed in the exchange.

POMONA, KAN.—An Independent telephone company has been organized at Pomona, and the following temporary officers elected: E. G. Swayze, president; F. E. Dyer, secretary and treasurer; Fred Baldwin and Carl Hoopes, executive committee.

NEWS—WANTED

THE matter contained upon the Message and Operating Field pages of this paper is contributed largely by our special correspondents. We believe, however, that there are many valuable items of telephonic interest which are never brought to the attention of the public. There is no reason why this condition should exist, and the Editor, therefore, invites all telephone companies and the officials of such companies, to furnish any information that they can consistently make public relative to financial statistics, new construction, elections, franchises and personal items.

OUR MOTTO—QUALITY AND PROMPT SHIPMENTS.

KELLOGG "MICHIGAN WHITE" CEDAR POLES

THE poles we handle are all carefully selected, and are the best grade of stock.

All shipments are prompt, subject only to car supply.

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices.

We have recently published a little book giving some very valuable information about Cedar Poles. It contains Specifications, Inspection Comments, Shipping Data, Etc. "Yours for the asking."

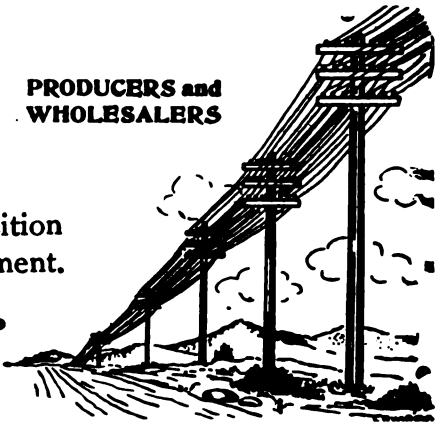
KELLOGG SWITCHBOARD & SUPPLY COMPANY - - - CHICAGO ILL.

PITTSBURG & LAKE SUPERIOR IRON CO.,
ESCANABA, MICHIGAN.

PRODUCERS and WHOLESALERS

WE always carry a large stock of all sizes of White Cedar Poles, and having yards on all principal railroads in Northern Michigan and Minnesota, are in position to make immediate shipment.

"From the Stump to the Line."



CEDAR POLES

Upon a foundation of SQUARE DEALING we have built a pole business excelled by none. Our reputation is of more importance than your order, therefore if you buy from us, you will be assured of getting what you want.

We solicit your orders and can please you in quality and prompt shipments.

THE WEEK'S MESSAGES

SALINA, KAN.—The New Cambria Telephone Company has been incorporated with a capital stock of $5,000.

CERESCO, MICH.—The Marshall Telephone Company, of Ceresco, has filed articles of incorporation. The capital stock is $1,000. The company will build a line from Ceresco to Marshall.

SHARON, N. D.—The Sharon Rural Telephone Company, Sharon, Steele County, N. D., has been incorporated with a capital stock of $5,000. Incorporators: I. K. Bakken, Oscar Barrett, Ole J. Vig, P. T. Duncan, A. Skadsdamen, Sharon, N. D.

POMEROY, O.—The Meigs County Home Telephone Company, Pomeroy, has been incorporated with a capital stock of $50,000. Incorporators: Arthur B. Kratz, C. E. Peoples, George Schwegman, O. A. Rowley and F. F. Stansbury.

COLUMBIA, OKLA.—The Dover & Columbia Telephone Company, of Columbia, has been incorporated with the following incorporators: A. Haughey, J. D. Crabtree and W. C. Ball.

DEER CREEK, OKLA.—The Deer Creek & Lamont Telephone Company has been incorporated with a capital stock of $1,200. The incorporators are: John W. Baker, of Lamont; S. R. Vincent and E. P. Webster, of Deer Creek, and B. W. Ritter, of Eddy.

PECKHAM, OKLA.—The Middleton division of the Peckham Mutual Telephone Company has been incorporated with a capital stock of $225. The incorporators are: H. S. Hook and Richard Sherbon, of Peckham; D. A. Johnson and W. J. Sherbon, of Wilbur.

WEATHERFORD, OKLA.—The Northwestern Mutual Telephone Company has been incorporated with a capital stock of $3,000. Incorporators: W. S. Wood and W. M. Coddington, of Weatherford; Joseph Wolverton, of Indianapolis, Ind. The company will build a telephone system throughout the counties of Custer, Dewey, Day, Woodward and Beaver.

EBENSBURG, PA.—The Farmers' Telephone Company, of Nicktown and Ebensburg has been organized with a capital stock of $5,000. The directors of the company are: A. B. Kirch, H. P. Plummer, S. H. Kirch, G. R. Edwards, Eli Jones, Stephen Griffith, John Griffith, Harvey Evans, Porter Davis, John Douglass, J. H. Lute and Harry Good.

LILY, S. D.—The Lily Local Telephone Company, of Lily, Day County, S. D., has been incorporated. Incorporators: B. P. Kortgard, H. H. Payne, O. K. Berg, H. E. Patterson and David Regneir.

GIATTO, W. VA.—The Crane Creek & Widemouth Construction Company, of Giatto, W. Va., has been incorporated with a capital stock of $10,000 to construct and operate telephone lines. Incorporators; W. C. Pritchard and J. H. Parrett, of McComas; Roger Martin, of Springton; Jairus Collins, of Bramwell, and R. D. Patterson, of Giatto.

EASTMAN, WIS.—The Western Crawford County Farmers' Telephone Company, Eastman, Crawford County, has been organized. Incorporators: James Fisher, J. F. Maney, J. R. Maney, G. H. Harvat and M. Lennehan.

PERSONAL.

E. D. CHIPMAN has been appointed manager of the plant of the Maquoketa Home Telephone Company at Maquoketa, Ia.

THOMAS CONNOR has been promoted by the United States Telephone Company to the position of manager of the office at Marion, O.

WALTER H. DREW, of Milwaukee, has been appointed district manager of Racine, Kenosha and Walworth counties, with headquarters at Racine, by the Wisconsin Telephone Company.

FRANK FERRIN has recently assumed the duties of manager of the Jones County Telephone Company at Monticello, Ia.

WILL H. MARTIN, of Green Bay, has been appointed manager of the De Pere exchange of the Fox River Valley Telephone & Telegraph Company.

P. S. STANDCLIFF, of Akron, has taken charge of the plant of the United States Telephone Company, at Milan, O.

MISCELLANEOUS.

ELKHART, IND.—The Home Telephone Company had a net increase of 356 telephones in Elkhart and Goshen during the past year. The company now operates 2,484 telephones and of this number 1,627 are in Elkhart.

GRAND JUNCTION, IA.—The Farmers' Mutual Telephone Company has completed its new exchange and already obtained 30 subscribers at this place.

ST. PAUL, MINN.—The Tri-State Telephone & Telegraph Company has recently cut over its new toll board in St. Paul. Attractive engraved invitations were sent out to a selected number of individuals, and guests of the company in this way were enabled to obtain a very satisfactory idea of the extent of the improvements involved in the change to the new switchboard. It should be a valuable factor in the promotion of the friendly relations which have existed between this company and its subscribers.

KITTANING, PA.—The Kittaning Telephone Company is giving toll connections to Leechburg, Vandergrift and Apollo over a new line.

New Construction in the Field

LEADVILLE, COL.—The Leadville Telephone Company is to build a line to Denver.

PAONIA, COL.—The Co-operative Telephone Company expects to extend its lines in Delta.

ALBANY, GA.—A new line is to be built from Prineville to Cascadia, at which place it will connect with the line to Albany.

PEORIA, ILL.—The Inter-State Telephone Company is to have a direct line through Peoria to Springfield.

SPRING VALLEY, ILL.—The Bureau County Telephone Company, with an exchange at Spring Valley, is to establish an exchange at Ladd.

MATTHEWS, IND.—The Matthews Telephone Company contemplates making further extensions to its lines.

NEW ALBANY, IND.—The Harrison County Telephone Company's lines are being extended to the Floyd County line near Georgetown, where they will connect with the system of the Home Telephone Company.

HAWARDEN, IA.—The Hawarden Telephone Company contemplates making many improvements and extensions.

CHANUTE, KAN.—The Wareham & Wood Telephone Company, of Chanute, is to place its wires underground.

ELLINWOOD, KAN.—The Ellinwood Telephone exchange contemplates many improvements in the spring.

OTTAWA, KAN.—The Ottawa Telephone Company is to spend between $30,000 and $40,000 in improving its plant at Ottawa.

SPINKS CORNERS, MICH.—The Spinks Corners Telephone Company is to build a line to Watervliet. A line will also be built south from Watervliet.

DEEP RIVER, MINN.—The Mesaba Telephone Company, of Mesaba, is to build a line to Deep River.

READING, MINN.—The Farmers' Mutual Telephone Company is to build a line from Reading to Rushmore. A number of other new lines are under consideration, and construction work will commence as soon as spring opens.

ST. JAMES, MINN.—The St. James Telephone Company is to build eight or nine farmers' lines.

WESELY, MINN.—The Wesely-New Prague telephone line is to be extended to Schieldsville, Lonsdale and New Market.

SPEED, MO.—The Independent Telephone Company is building a line to Boonville.

SANTA FE, N. M.—The Santa Fe Electric Telephone Company is to build a line from Albuquerque to Socorro.

FLAG, O.—The Boston Telephone Company is building a line to connect with the Stafford Company's line.

HAMILTON, O.—The Hamilton Home Telephone Company expects to spend $35,000 in improving its system.

MANCHESTER, OKLA.—The Eureka & Manchester Telephone Company expects to commence the construction of its line very soon.

GETTYSBURG, PA.—The United Telephone & Telegraph Company is to entirely rebuild its system at this place.

SHICKSHINNY, PA.—The Farmers' Mutual Telephone Company, which has extended its lines to Cambria and Rittenhouse, expects to build a line to Benton.

STROUDSBURG, PA.—The Slate Belt Telephone Company, which already has poles up between Portland and the Delaware Water Gap, will build a line to Stroudsburg.

MILBANK, S. D.—The Grant County Telephone Company is to spend $30,000 in extending and improving its system.

ROCKFORD, WASH.—The Rockford & Mt. Hope Telephone Line Company has applied for permission to construct and operate telephone lines on county roads near Rockford.

INDIAN NECK, VA.—The Indian Neck and Rappahannock Telephone Company proposes to build a line to Stevensville.

BRIDGEPORT, W. VA.—The Bridgeport Telephone Company is to extend its lines to Bushy Fork.

SHEBOYGAN, WIS.—The Citizens' Telephone Company, of Sheboygan, is to spend $30,000 in improving its system.

Poles That Last
are poles that are impervious to moisture. They don't grow that way but have to be treated with a creosote compound which expels all the inherent moisture and protects the exterior from the action of ground rot.
Our business is preserving poles by this process. It is not expensive, and when the life of a pole is increased indefinitely by our treatment, don't you see where you can save money by writing us for prices?
We will preserve your poles or sell you poles already treated. Write for booklet.
NORFOLK CREOSOTING CO., NORFOLK, VA.

Digitized by Google

THE CORD THAT LASTS.

This cord consists of two steel piano wires covered with a spiral of fine copper wire. The cord is then insulated with a silk and cotton insulation and each conductor is covered with a cotton braid, one of the conductors having a red tracer so as to distinguish it from the other. The conductors are then formed into a spiral and covered with a heavy, waxed, gray Gilling Thread.

"EACO" STEEL SWITCHBOARD CORD

will outlast anything on the market. Write and get prices, and when doing so state what make of switchboard you are using.

ELECTRIC APPLIANCE COMPANY, Telephone Manufacturers, CHICAGO SAN FRANCISCO

STRENGTHEN THOSE LEADS NOW

You don't have to thaw the ground. DRIVE a D. & T. Anchor THROUGH THE FROST. TWIST it UNDER the frost. We guarantee them to operate through TWO FEET OF FROST.

NORTH
COMMON BATTERY TELEPHONES

The hinged front of "NORTH'S" common battery wall type telephone renders the condenser and instrument wiring accessible without removing from the wall.

The cabinets are not veneered, but every stick of lumber is from a veneered mill; for they handle nothing but the most beautifully figured woods. The stock is 18 months old, kiln dried 30 days and given a hand-rubbed finish involving 7 processes.

They are equipped with the following standard parts, and will operate on any standard common battery system.

"NORTH'S" Solid Back Transmitter that combines ample volume, perfect articulation, deep penetration and natural pitch.

"NORTH'S" Permanently Adjusted Receiver. The diaphragm does not rest on the outside shell, but on a bell-shaped metal seat—it isn't thrown out of adjustment by unequal expansion of hard rubber and magnet metal.

"NORTH'S" New Ringer, provided with a knife-edge, weighing-scale bearing armature—it can't tighten or drop out of place.

"NORTH'S" Horizontal Lever Adjustable Tension Switch-hook with long flexible contact springs—they can't break or become misplaced, and always resume their normal positions.

The parts are individually tested—the transmitter by an engineer. There are two inspections during assembling, a final test on completion and again a test before shipping—just to make sure.

CENTURY
100% GOOD

OUR MAGNETO DROPS

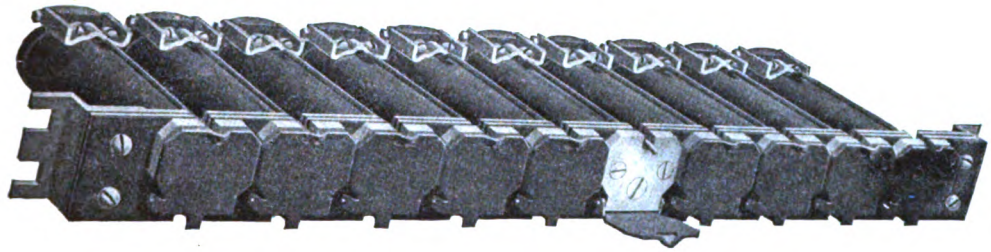
are mounted ten on a strip,—separate from the jacks

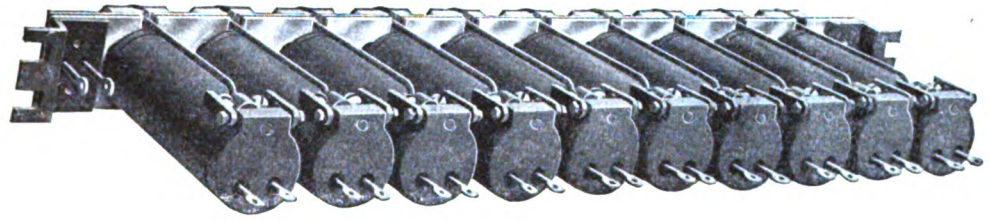
Any drop can be removed by taking out one screw from the front.

The drop coils are enclosed in an iron tube. This tube is made of high grade Norway iron, electrically welded.

The Tube and Armature are copper plated and lacquered.

Only silk covered wire is used in winding the coils, the wire being the largest size that can be used to obtain the required resistance.





Night bell contacts on our drops can be relied upon at all times. The back plate of the mounting strip is one side of the night bell circuit and the shutter strip is the other side. The shutter in falling, comes in direct contact with the back plate, enclosing the circuit.

Let us quote you prices on your new magneto switchboard. We will send sample parts for your inspection.

CAN WE INTEREST YOU IN OUR NEW 4-PARTY SELECTIVE SYSTEM FOR MAGNETO EXCHANGES? ABSOLUTELY RELIABLE.

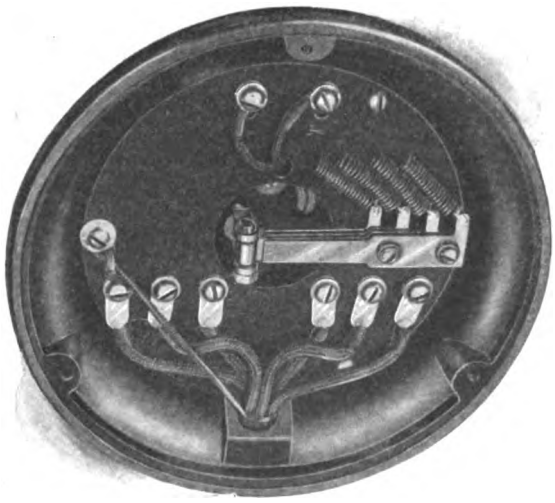
MONARCH APPARATUS

THE DESK SET



All wiring of a Monarch Desk Stand terminates in the base. The transmitter connections are metallic, and are brought down in two conductor silk cord. The hook switch springs being mounted upon the base, no other wiring passes through the pedestal tube. The connecting plate is made of hard rubber. All connections are plainly marked. Clips are provided for the receiver and connecting cords. All connecting plates are interchangeable. Local battery desk sets can be made to common battery by changing the connecting plates and transmitters. All Monarch Telephone Apparatus is described in the new catalogue. A copy will be sent upon request.

TYPE A—10-Pair Hall Cable Box.

CABLE TERMINAL EFFICIENCY.

A great deal of the efficiency of a cable plant depends upon the terminal and distribution facilities. And what is more, the type of terminal is of the greatest importance. Some of the points to be considered in its selection are protection, "getatability," compactness, rigidity. Considering these features collectively or individually you cannot find a terminal on the market that is superior to the HALL. Protection was given the greatest attention in its design so that when you buy a

HALL CABLE TERMINAL

you have bought protection against lightning, sneak currents, or crosses with dangerous circuits. The "getatability" of the Hall is unique. When the cover is taken off the top, bottom, front and back are exposed. No opportunity here for faulty inspection.

Compactness? Just look at the illustration. That tells its own story.

Rigidity? An all-metal framework carries the terminal plate. We couldn't make it stronger if we tried.

Seems to us you ought to get prices. Your name and address will bring them, and some more facts that will be of value to you.

DEAN TELEPHONE APPARATUS

"There Must Be a Reason"

ORIGINALITY

Originality in telephone design is dangerous unless the product is the result of experience—experience of the minor as well as the major details. Our originality is not necessarily the product of one individual. It is the product of our anticipation of the requirements of the most progressive buyers put into shape by engineers of wide experience and perfected by the process of construction and elimination. We do not pose as makers of telephone novelties, but sturdy product which will give the most efficient service for an unlimited space of time.

The best testimonial we have to offer is that this originality has in a great measure caused our business to grow to its present mammoth proportions—business from buyers who demand the best regardless of cost.

Our prices are reasonable, therefore it will pay you to try the celebrated Dean product in your new year's construction.

WANTED
AN ENGINEER

This is the call from telephone companies all over the country. Never before has there been such a demand for competent, educated men in the telephone field and never before such a lack of men capable of filling the positions.

Improved apparatus, up-to-date methods, require educated, up-to-date men, competent to look after growing interests.

Are you fitted to do the work, or are you one of the large army of men who would be competent if they had the proper education?

If so, you should not allow a day to pass before you start on the road to improve your knowledge.

The American School of Correspondence offers you a ready means whereby you can secure the desired technical education which will lift you out of the rut. You do not have to waste a moment's time away from your present employment. You can be trained by expert instructors, and you will receive as great personal attention as if you attended a resident Engineering School.

Better think the matter over. We can help you to better pay, better hours and a chance to rise to a position of influence if you will let us. Fill out the coupon to-day. It doesn't cost anything and will bring our 200-page Bulletin, describing over 60 different courses in different branches of engineering and full information about any course you mark with an "X."

Tuition fees are moderate—from $10.00 up—and may be paid in small payments. We employ no agents. All money paid by the student is used in instructing the student.

American School of Correspondence

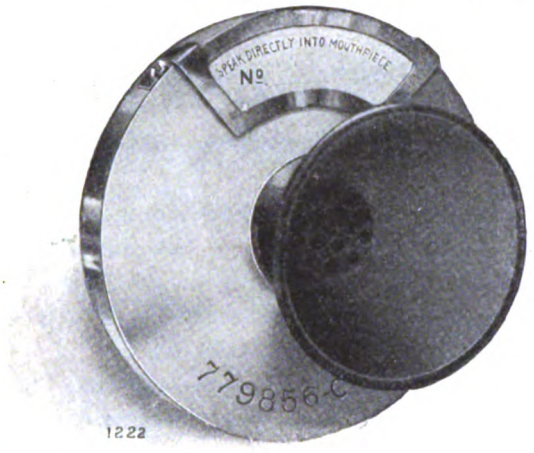
The Stromberg-Carlson Transmitter

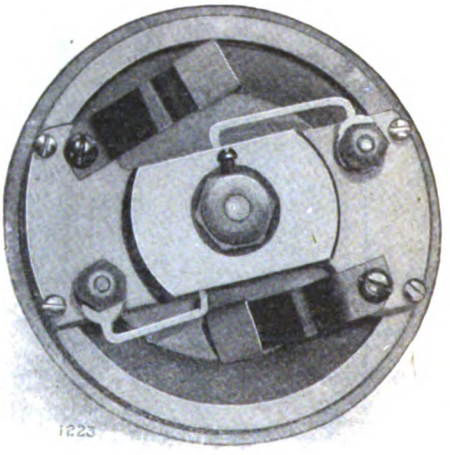


FRONT VIEW Showing Card Holder

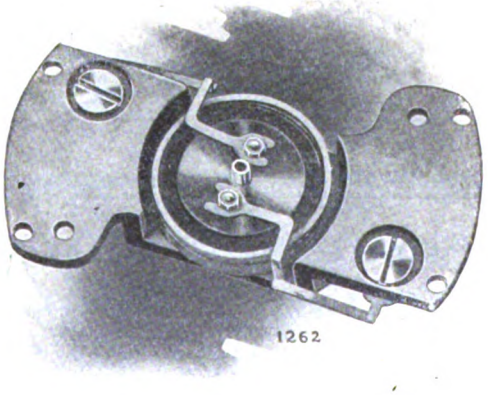
is decidedly different from any other you have ever seen. If you were to try it on a long distance line, then you would notice the difference---that counts.

THE ELECTRODES

are made of carbon, and both are attached to the central point of the main diaphragm. There is thus produced a variation in the distance between the electrodes of twice the amplitude of variation of the central point of the main diaphragm. It is unnecessary to claim a greater volume of transmission than if only one electrode moved.



TRANSMITTER With Back Removed



BRIDGE WITH CARBON CUP Showing Conductor Attached to Each Electrode

We give the transmitter such an adjustment that under ordinary tones of voice the volume is not as loud as some of the forms of sensitive transmitters now on the market. As the voice is raised, however, the volume of transmission from the instrument is multiplied two-fold so that the transmission, when talking in a loud tone of voice, has much more volume than that of any other type. The advantage of this is readily seen.

Let us send you new booklet describing and illustrating this transmitter. It tells the whole story, we mail it free.

Just ask for Booklet No. 91-B.

WE MAKE CABLE

CABLES VERSUS OPEN LINES

In places like this, it is impossible to carry even a pair of open wires, yet cable made it possible to carry 175 pairs without marring the trees in the least. Suburban subscribers as far out as ten miles are supplied from one exchange in this way. The open wire line (on left side of the street), carries 25 pairs, and necessitates the operation and maintenance of two sub-exchanges to supply the same territory. The cable lines are Independent; open lines Bell.

The most successful exchanges to-day are following out this practice and using all the cable they possibly can.

It's cheaper—reduces cost of maintenance—increases dividends. Don't let prejudice, fear or anything else prevent you from using as much cable as possible. You'll find it the best investment you ever made.

It will be unnecessary to advertise your improvements, your subscribers will do that—because of the better service.

Let us quote you prices. We make cable to meet your own specifications.

Have you a copy of our booklet, "Cable, the Making of it"? We mail it free.

NEARLY 90 PER CENT.

of all the telephone exchanges (both new and replacements) sold in the United States during the past few years have been

OUR AUTOMATIC SYSTEM—BECAUSE

It improves the service; being perfect, prompt and absolutely private, thus supplying a logical reason for advancing rates which have been too low.

It lowers the expenses; costs 50% less to operate and maintain than a manual exchange.

It makes it possible for the operating companies to pay good dividends on their stock, thus

It enhances and steadies the values of telephone securities, making and keeping them a safe, desirable and profitable investment.

Our automatic system adopted in the following cities:

CHICAGO, ILL.	SOUTH BEND, IND.	ALBUQUERQUE, N. M.	WESTERLY, R. I.
GRAND RAPIDS, MICH.	ABERDEEN, S. D.	TRAVERSE CITY, MICH.	MANCHESTER, IA.

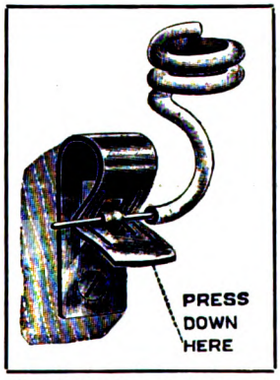
ARE YOU WISE?

The average man is careful about large expenditures, but he is a wise man who considers the pennies. That is why he is spared big losses, because it is the little ones which go to form the big one.

When buying telephones, you are very careful to see that you get the best you can for the money. You investigate the transmitter, receiver, generator, bell, hook, wiring and finish, and unless they are satisfactory you do not accept them. How about the battery cells? Are you so critical in their selection? If you are, you will not accept any that are not equipped with the



Fahnestock Spring Binding Posts

Past experience with the old screw type has demonstrated the following defects: It works loose, it cuts the wire, it causes quick corrosion because it does not allow any air circulation around the contact surfaces; it is hard to keep clean, and can be readily broken in fastening. If you continue to use it you take unnecessary risks. The **FAHNESTOCK SPRING BINDING POST** has no such defects. It is simple, holds the wire securely without cutting; it is open, and so permits free air circulation; it cannot be broken in adjustment; it never works loose.

It adds no additional cost to a dry cell, and can be obtained for the asking.

BE WISE AND SPECIFY IT. SAMPLE FREE.

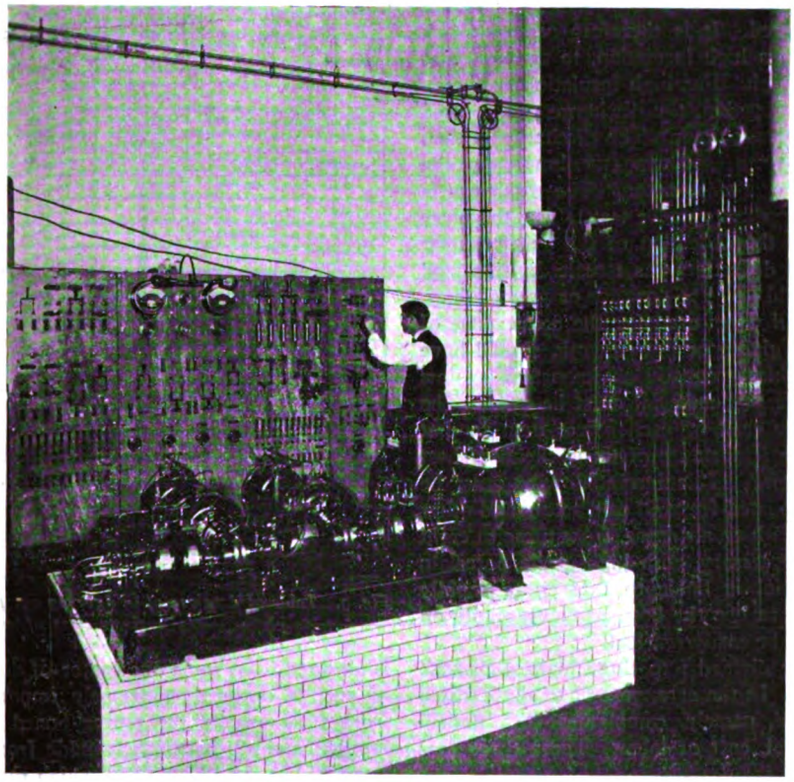
Power Data for Telephone Men

By P. Kerr Higgins.

TELEPHONE companies often expect the inspector to do his own electric wiring and in large exchanges to supervise and in some cases take charge of the wiring of the entire building, and the man who once was expert in telephone matters only, is now expected to be posted on lighting, power and wiring. It is here assumed that the average telephone man is familiar with the general principles underlying electricity and magnetism. However for the benefit of those who may be rusty along this line, and especially in the rules and tables relating to motor work, circuit loads, wiring, etc., this ground will be gone over in a general way so as to introduce and explain the various terms which may be unfamiliar to many.

Electricity may be divided into three great divisions: (1) Static; (2) Dynamic; (3) Voltaic. In telephony, as in no other active branch of science, we come in contact with electricity in almost every form, hence in the author's opinion it is only a question of time when the telephone engineer will of necessity take rank with the best of electrical engineers.



Switchboard for Controlling Current for Actuating Apparatus in the Exchange of the Citizens' Telephone Company, Grand Rapids, Mich. Machines for Supplying Ringing Current Are Mounted Upon the Pier in the Foreground, and the Switches Which Control These Machines Are Placed Upon a Special Panel Shown at the Right of the Machines.

It is true he will not be called upon to handle, construct or possibly use the immense machinery used in electric lighting or street railroad work, but he will nevertheless be expected to know much of their principles, methods and circuits. This is obvious even now when the high tension systems become grounded and pump into the telephone lines inductive disturbances which paralyze the business while they last. It can also be seen in electrolysis, which plays such havoc with our cables, more and more of which are being used every day. If the telephone engineer does not understand the cause, how can he apply the remedy? Only by being dependent upon others for information which should be his very own. The demand for knowledge in telephone men of all classes is becoming greater every day, and with new systems, new methods, auxiliary apparatus and larger exchanges this condition will continue and grow more imperative.

In considering the sources of supply we find two kinds of current furnished, sometimes alternating, sometimes direct, and, in the larger exchanges, both. The voltage may be 500, 220 or 110. In some exchanges current at 104 volts is supplied.

The supply wires are usually put in by the company furnishing the power, but the leads from the meter to the power board and to the machines must be of the proper size, for if not there will be either waste of energy or damage to apparatus. We will therefore consider some of the rules governing this branch of the work. The prime consideration in all wiring is the proper laying out of the circuits, and the same rules will apply to telephone power that would to electric lighting.

In order to have wires of the proper size one must know the laws of resistance, drop of potential, etc. In measuring resistance, the Wheatstone bridge method is familiar to every telephone man and consists of the familiar figure of a base line on both sides of which are two triangles, as shown in Fig. 1. Connected up in series with the base line is the detector which may be a galvanometer, a lamp, or a receiver. Now when the values of resistances composing the arms of the bridge are according to the proportion A : B = C : X, a balanced condition is the result, in which no current passes through the galvanometer. Three of the arms may be made variable. If adjusted to bear a definite relation to each other, X may be an unknown quantity represented by the line or apparatus under test. The arms are then adjusted to find a balance, and the resistance in C will represent the resistance of X, provided A and B have equal resistance, or if unequal then $X = B \times C \div A$. It is possible to use lamps and form a bridge which proves very interesting, instructive and useful. The principal feature to remember is that the ratios must be A : B = C : X, and such a bridge with

Digitized by Google

known resistance of fixed quantity will prove very serviceable in testing wires, armatures, field coils, etc. The method of making a resistance test is shown in Fig. 1*a*, *b*, tables of resistance Figs. 3 and 4. The resistance of a lamp varies, being nearly twice as much when cold as it is hot. The resistance can be found by dividing the voltage across the lamp terminals by the number of amperes flowing through the lamps. The insulation of wires may also be tested in a like manner by freeing one end of the wire

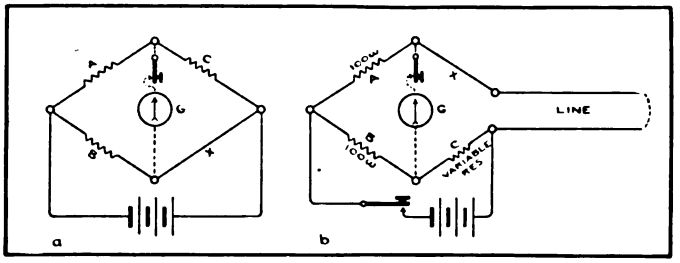


Fig. 1. Conventional representation of Wheatstone Bridge circuits, showing method of connecting unknown resistance.

under test and grounding the binding post from which it was taken off the bridge. This insulation is the opposite in effect of specific conductor resistance, in that as the wire is increased in length the insulation is lowered. It is therefore necessary for every foot of wire to possess a high insulation, to the end that the general average may be high. For high insulation tests, say over one million ohms, one megohm, the discharge test is used with a sensitive reflecting galvanometer. The discharge is then taken through a known resistance (say 1,000,000 ohms), and the deflection on the galvanometer needle noted. The discharge is also taken with the line or apparatus under test taking the place of the known resistance and the deflection of the galvanometer needle noted, then if the first deflection was 1 scale division, and the second 50, the result would be 50 × 1,000,000 or 50 megohms.

It is very important that all wires used for the conveyance of power, whether for electric lighting or power work, should have the very best insulation. This is equally as important as low resistance and to this end the best material must be used. The underwriters' rules should be read by each power man so that he may know and realize the importance of using the very best grade of rubber insulated wire. This insulated wire must be supported and thoroughly insulated from all conductors and other material and be surrounded with an air space, from three to eight inches, and fastened, when necessary, with high grade porcelain insulators. Insulating material is liable to deteriorate rapidly and it is therefore necessary to use the best, more especially on concealed work which cannot be easily reached.

All wiring systems may be divided into three main divisions: Mains, feeders and branches. In the arrangement of these, three things have to be considered, namely, compliance with underwriters' rules, cost of material, cost of labor. These three fac-

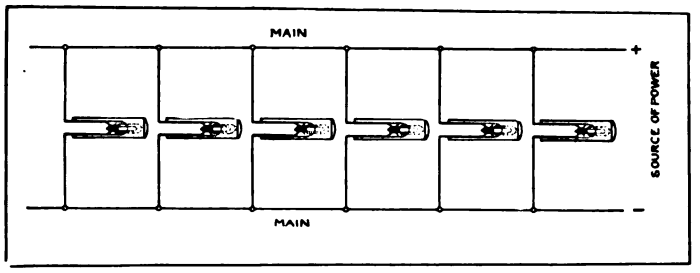

Fig. 2. Arrangement of circuit when lamps are connected in multiple.

tors determine how the work must be done. The first includes one requirement to be considered above all others, which is the amount of drop taking place in any one circuit.

The cost of material is always known, hence the object of the wireman is to so lay out his work as to keep the labor bill down to the minimum without a corresponding needless expense in material. In adopting one of two possible ways, if the material cost in both is equal, then the labor cost decides. If the labor is the same in both the copper will decide the best course to adopt. To find the drop, the following rule is very helpful: If the full drop permissible is 3 per cent., then an arbitrary drop of 1 per cent. may be considered, which at 110 volts = 1.1 volts. The circular mils required are then amperes × feet (both wires) × 11 ÷ the drop. The arbitrary drop is that decided upon by the underwriters, contractor, or inspector and is usually from one to two per cent. If a drop takes place it is due to resistance and amperage, and this with proper insulation forms the foundation of all electrical wiring, whether for telephone power uses or for motors or for electric light. It is then oftentimes both economical and wise to use two sets of mains instead of one large set, and here is where the judgment of the wireman or engineer is seen to the best advantage, also in the arrangement or division of the drop throughout the entire system. In all systems the margin (especially on large work) should not be too close, enough being left for what is usually termed the overload, especially in the mains.

Before any wiring is done for any purpose it will be found time well spent to draw up, tabulate and arrange the distribution showing the drop permissible; size of wire, as calculated; voltage; amperage; length of mains, feeders and branches; number of outlets; detail of outlets, whether for motors, lights, charging of accumulators, etc., and amperage taken for each. Where much conduit or moulding work has to be done it is well to have the wire of a size which will permit the same size moulding or conduit being used for all work, especially the branches. Wiring

SAME AS RESISTANCE PER 1000 FEET

Fig. 3. Table of data useful in figuring out proper dimensions of leads for a given class of work.

is all done from some one center of distribution, and the selection of such a center is extremely important. In telephone power work it is usually the power board to which the mains are brought and all distribution made from that point. A back bone is created in the mains from which radiate all the branches. This main distributing lead usually takes the form of copper bus bars, to which are attached fuses for each circuit of a capacity corresponding to the safe load which the branch is supposed to carry. All the fuses should be plainly marked, and in no case should the fuses be "jumped" by wires. As soon as the fuse is "blown" another, of the same size, should be put in.

Two methods of wiring are to-day in common use by supply companies. These are the two-wire system, and the three-wire system. The two-wire system permits of only one pressure, usually 110 or 104 volts. The three-wire system permits of two voltages, 110 or 220. This is very convenient in that both motors and lamps may be used on one system. It is of course true that this could also be done with a voltage of 220 by using two lamps in series, but is undesirable for many reasons. The three-wire system then represents a saving in copper as can easily be proved by any one by applying the following rule to any case under consideration:

$$\text{Circular mils} = \frac{\text{feet of wire} \times \text{amperes} \times 11}{\text{drop in volts.}}$$

Digitized by Google

Take for example 30 lamps (each one half amp.) on a two-wire system at 110 volts = 15 amperes, length 100 feet, would necessitate:

$$\text{Size of wire} = \frac{200 \times 15 \times 11}{.02} = 16{,}500 \text{ circular mils.}$$

In a three-wire system the size would be:

$$\frac{200 \times 7.5 \times 11}{2} = 8{,}250 \text{ circular mils.}$$

The quantity 11 is the approximate resistance of one mil foot of copper wire, for example, a copper wire one foot long and one circular mil cross section. If the number of feet of wire is constant then the resistance is inversely proportional to the cross section, so that if the resistance of 1,000 circular mils be 11 ohms then 10,000 mils = 1.1 ohm, hence the resistance is only one-tenth while the circular mils are ten times.

In the two-wire system two wires of 16,500 C. M. were necessary; in the three-wire system two wires of 8,250 C. M. The third wire carries only the surplus current of one side of the circuit above the other, which is almost nothing in a well balanced system. A system having an equal number of lights on both sides will in no case make the third wire carry more than a half an ampere represented by one lamp, as the next lamp would be connected up on the other side and so restore the balance if all the lamps are lighted. It is customary, however, to run all three wires of same cross section. In this case the amount of wire would be represented as follows:

Two-wire system, $16{,}500 \times 2 = 33{,}000$ circular mils. Three-wire system, $8{,}250 \times 3 = 25{,}750$ circular mils.

The saving is 7,250 circular mils, or a saving of about 25 per cent. In the three-wire system the two outside wires usually represent 220 volts and the circuit used for motor work. The difference in potential between one of the outside wires and the middle or common wire is 110 volts and this circuit is used for lamp work. The cross-section in circular mils represents the square of the diameter of the wire in mils (thousandths of an inch), and it is customary to consider wire in this way, although up to No. 0000 we frequently use the Brown & Sharpe or some other standard gauge. If the size is given in mils this must be multiplied by 100 to give circular mils. The foregoing rules will serve to show a net saving in favor of the three-wire system, but the system must be kept balanced to accomplish the aim in view, for the reason that all the consumers are by no means likely to use the light at the same time. There is ever present an unbalanced condition and this has had its effect on the full adoption of three-wire system, but is much exaggerated by the average electrician. While theoretically the three-wire system is always in an unbalanced condition, it represents a saving and is much more convenient, as a rule, than the two-wire system, especially in a commercial circuit where the power is used for other purposes besides lighting. In private installations where the city current supply is used, it is almost essential to have the building wired on the three-wire system. In order to find the loss or drop in volts on any circuit use the following rule:

Volts drop = current × resistance.

If a wire is carrying a current without loss there will be absolutely no heat produced; if, on the other hand, loss is present (owing to an overload) then heat is present and may be enough to melt the insulation, in which case there is danger of fire. Inasmuch as we measure the current consumed in the use of the electric light in watts, we then must also measure loss through heat in the wire in watts, hence:

SIZE OF WIRE B. & S.	LENGTH	AMPERES	RES. OHMS	DROP IN VOLTS
10	1000 FT.	10	1	10
10	2000 "	10	2	20
10	3000 "	10	3	30
10	4000 "	10	4	40
10	5000 "	10	5	50

Relation of Drop to the Current and Resistance of Standard Section of Wire.

Loss in watts = volts lost × amperes.

Or we may use another method:

Loss in watts = square of current × resistance.

And the horse power lost = 746 ÷ watts lost, since 746 watts is the equivalent of one horse power.

The higher the amperage, the greater the loss, the lower the amperage, the smaller the loss. The loss also increases as the number of wires are increased. The ratio in the first instance being 4 to 1 with double the amperage. Hence the best practice is to increase the voltage and keep down the amount of current.

To observe in practice the drop through a given piece of apparatus, in a lamp, for instance, bridge around the lamp a voltmeter, and the reading will show the loss of potential. It is very apparent from this figure that a loss in pressure has resulted and is in proportion to the resistance introduced. If we know the voltage and the amperage the resistance of the lamps can be found by dividing the voltage by the amperage. If we know the voltage and the resistance of the lamp then amperage = voltage ÷ the resistance of lamp.

(To be continued.)

The Financial Side of the Telephone Business

By Harold D. Stroud.

THE telephone business is one that, of all public service institutions, has been slowest to respond to the dictates of sound finance, yet the fact that it has prospered in spite of this is sufficient reason to show for it great possibilities in the future, as well as to commend it to investors at the present time, provided that the plan of selling the service is rational.

In stating that this business is not based upon sound finance, the writer refers to the conclusion of a committee of the Merchants' Association of New York City, appointed to investigate into the rates and service of the New York Telephone Company. In their work they were assisted by the New York Audit Company and Westinghouse, Church, Kerr & Company, the former to go over the accounting methods and the latter to report on the methods and apparatus for making the service charges.

The conclusions of this committee, which was composed of some of the best men of New York, was summed up in the following words:

"It is the opinion of this committee, therefore, that in large cities the flat rate with unlimited service is based upon a fallacy. That it is extremely unjust to small users, favors large users, unduly impedes expansion of the telephone business, tends to inefficient service, and as a business proposition, it is unsound."

The unquestionable character of the committee and its experts is such as to indicate to fair minded people that the conclusion is a true one, unbiased by selfish or ulterior considerations, and that their condemnation is that of a principle underlying the business in so far as it is based upon the flat rate method.

The men who composed the committee are men who have either at no time regarded flat rate in any line of business as sound, or have long since discarded it in their own line of business, and therefore, it is safe to accept their report as logical and fair, regardless of whom it affects, or what business it is applied to.

In any business of great magnitude, the use of outside money

Digitized by Google

is essential, money belonging to people who know nothing about the details of the business. This means that there must be something upon which to base confidence, some guarantee.

The bulk of the money so invested is given only after a careful study of the particular business by men whose judgment is known to be sound and whose conclusions are based not only upon past performances in the particular line but upon the principles involved, and who know why this or that investment is good and why it will continue to be good. These men have their rules or guides to follow in most cases, so that there are only the general conditions to study.

In the realty business they know that a certain investment is good or bad, because there is a fixed or tangible basis. The particular piece of ground cannot move, therefore the value of that piece must be based upon its present or probable future relations to its surroundings.

In the railway financial world they have their rules to follow, based upon the present and future population, and resources of its territory, together with the cost of constructing, equipping and operating a line.

Of recent years, much attention has been given to interurban electric lines and the men who have handled the money for their construction have formulated rules to guide them in determining the safety of such investments. Their basis is the present travel between the objective points by the existing methods of physical communication, together with the possible future increase, due to increased population, and the cost of constructing, equipping, maintaining and operating a line.

For instance, there is a town at one end of a line, of 10,000 people (adult population) and at the other end one of 5,000; they calculate that under similar conditions one-half of this combined population have travelled an average of one and one-half trips per week. Exact figures are unnecessary for the present purpose and the above is merely to show the method of determining whether or not the conditions are ripe for the investment necessary to build the line.

Now let us come to the telephone business from the investors' standpoint, referring to the point of view of those who are entrusted with the large amounts of money for investment purposes. What guides have they to go by or what basis was used by them in determining the value of past telephone investments? None, except the success of other companies that may have succeeded under conditions quite different from the ones under consideration.

This is not wholly true of all telephone investments, because in the long distance field there are accepted rules, based upon the use of the service of other telephone and telegraph companies, but it is true, in the development of local service telephone companies, that they have gone by guess work, which does not go with men whose judgment is at stake on investments.

That they have succeeded on this basis is not so much to their credit as to the credit of the business. Any other business would have fallen in ill repute with investors under the conditions, because, it could not have paid.

In New York, Chicago, Cleveland, St. Louis or in almost any of the large cities, railway, gas, electric light or water bonds are a staple form of investment and one need not peddle the proposition to reach at least a good listener. But the men who are ready to consider a local service telephone proposition are few and far between until you can show them a parallel between the telephone and the gas or railway proposition, and this can only be done when your earnings are based upon similar principles. In railways, a certain amount of travel brings a certain amount of money; in gas, a certain amount of cubic feet of output brings a certain profit; in electric lights a certain number of watt hours on the "gross output" meter, forms the basis of the financial possi-

bilities of the business, but in the telephone business. a certain number of telephones is no safe guide to the earnings of the company on its investment, because the telephone company that sells its service by the telephone never knows what its service or operating costs are going to be in advance. This is because it cannot control the amount of calls it must make, though it has fixed charges to meet in giving the service, and these charges are in proportion to the amount of service it must render.

The proper basis, therefore, is to make the call the unit of charge instead of the telephone, and if necessary, make a low fixed charge per month to guarantee a sufficient return aside from the traffic earnings to cover the interest and the investment of bonds. When this is done, the telephone bonds will find favor among the investors, and the wider development brought about in the industry will give employment to millions of money now seeking investment in other channels.

Economical Telephone Accounting and Filing Systems

ARTICLE III.—BRANCH EXCHANGE REPORTS, CONTINUED.

*By Charles C. Wilmot, Telephone Accountant.

This article and all forms reproduced have been protected by individual copyrights.

The Nebraska Independent Telephone Association Holds Its Annual Convention

AT the annual convention of the Nebraska Independent Telephone Association held in Lincoln the delegates transacted business which included the following:

Passing of resolutions favoring united action to support wholesale interests in only those cities favorable to Independent telephone interests; provision for arbitration board and traveling secretary; provision for dividing state into five districts to handle local matters; raising of funds for association expenses for 1906; provision for early issue of a state directory of 35,000 Independent telephones; endorsement of work of former legislative committee, which was reappointed; affiliation with the National-Interstate Telephone Association representing fourteen states and two million telephones.

Representatives from a number of adjoining states were present, and a hundred and fifty Nebraska companies sent delegates, while a number of manufacturers were represented by salesmen and by exhibits.

The association is making most satisfactory progress, the secretary's report showing a growth during the year that is remarkable. Steps were taken to carry on the good work of the former legislative committee, consisting of Frank H. Woods, Judge Allen W. Field and Col. C. J. Bills, which only failed of securing an Independent telephone measure in the last legislature by one vote. The convention was attended by Theodore Gary, of Macon, Mo., vice-president of the National-Interstate Telephone Association.

The executive committee was authorized to divide the state into five or more districts, such districts to handle in their local meetings all matters of purely local interest, including arrangement of toll service, division of territory, etc. The executive committee was constituted an arbitration board to settle disputes where necessary. The appointment of a traveling secretary will insure a more rapid extension of membership. The assessment levied for supplying funds to meet the aggressive campaign during the coming year was passed unanimously, and indicates the good financial condition of the members as well as their appreciation of the importance of the association's growth to them.

Provisions were made for making a state directory containing the names of 35,000 people now accessible by toll-lines.

The following officers were elected for the coming year:

Frank H. Woods, Lincoln, president; W. Clapp, Kearney, vice-president; R. E. Mattison, Lincoln, secretary and treasurer. In addition to the above, W. E. Bell, of York; Thomas Parmalee, of Plattsmouth, and G. J. Garlow, of Columbus, constitute the board of directors. Delegates to the National Association: F. H. Woods, Lincoln; W. E. Bell, York; T. H. Pollock, Plattsmouth; alternates, R. E. Mattison, Lincoln; W. J. Stadelman, Kearney; I. D. Clark, Papilion.

At the annual meeting of the Telephone Traffic Association, which handles the clearings for toll business, the following officers were elected: T. H. Pollock, Plattsmouth, president; W. E. Bell, York, vice-president; R. E. Mattison, Lincoln, secretary; F. H. Woods, Lincoln, treasurer.

The secretary in his report stated that during the past year a great deal of progress had been made, both in the building of exchanges and new toll lines. Several hundred miles of new copper line have notably extended and improved the toll service. Although practically every company in the state has been approached, the secretary reported that with three exceptions no company of importance had entered into any agreement for connection with the lines of the Bell company.

R. E. Mattison, who has been acting secretary since November, furnished in his report statistics compiled from reports received from individual companies. These figures are the first to furnish accurate information of this nature. They show the following figures:

Independent telephones operated	36,028
Switchboards operated	138
Toll stations operated	166
Miles of toll line	3,148
Money invested	$3,118,400
Number of stockholders	3,640
Number of Bell telephones operated in same territory	11,902

These numbers do not represent all the telephones operated throughout the state, these being practically the number of telephones that are completely connected with one another by good toll lines. One year ago there were no Independent subscribers in Nebraska who could talk with more than 5,000 other Independent telephone users. To-day any one of the 35,000 telephones can be connected with any of the others of the group.

Sixty-two new companies have been incorporated in the state during the past year, which, together with extensive improvements to other plants, represent an expenditure of at least $1,000,000. The territory is being developed faster and is being equipped with better apparatus than has been used heretofore. The territory already developed by toll lines shows three Independent telephones to one of the opposition, and as additional territory develops the ratio will not decrease.

PRESIDENT GODDARD WARNS KANSAS OPERATORS AGAINST SUB-LICENSE CONTRACTS—CONCLUSION OF ADDRESS BEFORE THE ANNUAL CONVENTION.

"Many companies are handicapped seriously by being in debt. It places them in the power of manufacturing concerns, and in many ways interferes with the proper conduct of their business. But you say, 'How can we avoid this indebtedness? If we go to the bank to borrow money the rates of interest are high and the loans will be for a short time only. When they may have to be paid we have no more stock for sale or we cannot or do not care to sell any more stock, and I apprehend there are many instances when the growth of the business and the growth of the indebtedness become almost appalling. The legitimate and proper form of carrying such indebtedness by a telephone company is in the shape of bonds. But you say, 'Where can we find a market for the bonds?' and you write some Eastern bond broker, and he tells you that he cannot handle them. Your market for the bonds is at home. If the bonds are issued and are not sold they draw no interest. When they have been issued they can be used as collateral upon which to borrow money. You can probably induce some of your friends and acquaintances to take a few of them. After six months roll around and the interest is paid promptly on the bonds that have been sold the holder gets to feeling good, and the first thing you know people begin to inquire about the bonds. You will be surprised at the source from which these inquiries will come, and at the readiness with which the bonds will sell, but they probably will not go off at once. Frequently supply houses will take a few of the bonds if the trust deeds securing them have been properly drawn and executed and everything has been done in a legal manner.

"In conclusion you have got a good business proposition or you can make it such. Be alive to all your interests; take some of the telephone journals and read them; be exceedingly careful in the purchase of your instruments and apparatus, and see that you get

Digitized by Google

only the best; belong to the State association and keep in touch with its officers, and whatever you do, don't monkey with the Bell company. If you sell them a majority of your stock you might as well give them the rest, for in all probability you will never get any more out of it. If you make sub-license contracts with them you will live to regret it. Don't believe what some irresponsible agent tells you about some other company, and whatever you do, don't give them an option on your own property or plant. They don't get your option for the sake of taking the property under it. They want to use it as a club to beat out your brains, and to bring somebody else in line with them."

A LONG DISTANCE CONCERT.

By Robert J. Jessup.

SOME time ago the author participated in a musical performance given by two players separated by many miles, with the audience located at yet a third distant point. The author, provided with a head receiver connected to the telephone circuit and standing before a large horn attached to the transmitter, played on a French horn for the benefit of listeners in the office of the Spokesman-Review, at Spokane, Wash., 726 miles from Salt Lake City, in which place he was located.

The remarkable feature of the performance was that the piano accompaniment was played by a music dealer named Reeves at his store in Helena, Mont., 525 miles away. A transmitter, equipped with a megaphone, was mounted on top of the piano and this player also wore a head receiver.

In playing the Miserere, from Il Trovatore, for instance, your correspondent waiting in Salt Lake, could hear Mr. Reeves play the introduction, and then being well acquainted with the score, knew just when to begin with the melody. Then at the close of the strain, he would listen until the intermezzo had been played on the piano up at Helena, and then begin again. There was not the slightest jar between horn and piano during the entire program, and people listening along the line thought both instruments were being played in the same room. Your correspondent serenaded the adjutant's office at Fort D. A. Russell and the offices of the Cheyenne newspapers 500 miles distant, and one night was got up out of bed at 11 o'clock to serenade numerous central offices of the company scattered through the southern part of Utah. General Manager Murray was much interested in these experiments, and afforded every facility for their conduct. When satisfactory connections are made with the Pacific coast, an effort will be made to serenade the newspaper offices of several coast cities from Salt Lake. It is believed that the experiment could be carried on with success with Omaha, and even points east of that city.

An attempt was made by the telephone engineers to locate transmitters in front of the great organ in the Salt Lake Tabernacle, and reproduce organ recitals at points along the system, but the Mormon Church authorities were not favorable to this, and the experiments were cut short before they had been perfected.

CUYAHOGA COMPANY OF CLEVELAND SHOWN TO BE RAPIDLY INCREASING IN STRENGTH.

THE financial statement submitted to the stockholders of the Cuyahoga Telephone Company of Cleveland, O., shows a remarkable improvement. Less than four years ago when President F. S. Dickson was placed at the head of the company the earnings showed a net surplus for the year of $21. The company was not paying its bond interest until several months after it was due and was barely holding its own. It was sadly involved as a result of the Everett-Moore financial troubles and was in need of a large amount of new equipment. It was the mission of Mr. Dickson to straighten things out and put the company on a paying basis. It was a tough proposition but he has done more than any of his supporters at that time hoped for. He has not only equipped the company with a complete new central switchboard, but he has developed the business until it is nearly three times larger than when he found it and has made new business pay. The result is the company for 1905 has a net surplus, after everything has been paid, of $31,014.25. One feature of special interest in the statement is the fact that the profit sharing plan, introduced by Mr. Dickson, cost the company during the past year $13,481.87.

One year ago the statement showed a yearly surplus of $11,155.71, the growth for the year amounting to $19,858.54. This showing was one that caused a great deal of favorable comment among the stockholders and business men of the city. The company started the new year with a surplus fund of $58,324.06.

The statement showed the rental income from the telephones had amounted to $488,451.28 for the past year, while for the previous year it amounted to $350,422.96, the gain being $138,028.32. The gross earnings for the year grew from $435,274.02 to $587,487.01 for the past year.

The gross income of the company for the past year grew from $653,690.25 one year ago to $1,200,280.64 for the past year. A part of this is explained by the sale of $385,387.20 of securities.

During the years Mr. Dickson has been directing the affairs of the Cuyahoga he has had the strongest sort of organized opposition from the Bell interests, that company exerting itself to hold the lead it had on the Cuyahoga. During the past twenty-two months the list of subscribers of the Cuyahoga has doubled and the company on the first day of February placed in commission its 21,000th telephone. In the management of the company Mr. Dickson has drawn about him a working organization of young men who have been developed in the companies under his control and advanced as rapidly as they showed ability to manage larger affairs. He has trimmed expenses and brought the working efficiency of the organization throughout to a new high level, the result being the rapid growth of business and the very high rate of prompt collections. He took the position that service must be good and also must be paid for and he has not departed from either proposition.

AGREEMENT FOR CONNECTIONS ENFORCED BY COURT.

A HEARING has been had at Washington, Pa., in a proceeding by J. T. Bebout and the Claysville Telephone Company against the Federal Telephone Company, seeking to restrain the latter from refusing service and connections to the plaintiff company over the defendant company's lines, as agreed to in a certain paper drawn up by the two companies. By the agreement with the Federal company no connections were to be made with the State Mutual Company. Connections were made with this company, the Federal people alleged, and they proceeded to cut the wires and since have refused connections over their lines by the Claysville company. The plaintiff company alleged in its statement, that the only message ever received over the State Mutual lines was a trick message and received by the operator as coming over the P. & M. lines. The court after hearing the testimony, handed down an opinion refusing the preliminary injunction prayed for. The plaintiffs can now send their customers' messages at Washington and Canonsburg over the Federal lines, and the defendant company cannot refuse them if the tolls that are charged others for like services are tendered. The result is subject to reversal on appeal.

MARIETTA, OHIO, TO HAVE NEW PLANT.

EXTRAORDINARY growth of the business of the Marietta, Ohio, Telephone Company has necessitated the reconstruction of the entire plant. This will involve an expenditure of $50,000 and will provide equipment for more than double the present number of subscribers. A 1200-line common battery switchboard will be installed, together with several miles of aerial and underground cable. If a suitable site can be secured the company will erect its own building and thus be able to secure the right quarters necessary for its business.

The decision to undertake this work was made at a recent meeting of the board of directors held at Parkersburg. The work will be started about the first of April and the company expects to employ sixty additional men so that the changes can be made as soon as possible and with the least amount of interference to the service.

THE EDITOR'S PAGE

VALUABLE REPORTS FROM NEBRASKA.

THE report of the acting secretary at the annual meeting of the Nebraska Independent Telephone Association is made especially interesting by the fact that it contains figures which furnish accurate information in regard to the progress made during the past year. In order to successfully oppose the efforts of the Bell companies to tie up small Independent plants by sub-license contracts it is necessary to show the managers of such systems, as well as the public, that the Independent toll service is being rapidly developed. The Nebraska association seems to have made a most admirable start in this work.

INSTRUCTIVE ADVERTISING.

TELEPHONE companies may profitably use newspaper publicity for other purposes than increasing the number of their subscribers and paid connections. It may be the means of educating the public in the methods of carrying on the telephone business in such a manner that the number of illogical complaints against the service, and the strength of objections to the charging of reasonable rates will be materially reduced. It is a well known fact that the average telephone subscriber has an entirely inadequate conception of the details of procedure of a telephone company in its various departments. This ignorance is so extensive that not only is there no general knowledge of the manner of handling connections, but there is an almost total lack of information as to the extent of the wire plant, switchboard mechanism and the personal service which is at the disposal of any individual whenever he chooses to lift his receiver from the hook.

The reason for this ignorance has been pointed out in an admirable manner by President Dickson in his recently published book on "Telephone Investments." He calls attention to the fact that a telephone company which aims for good construction incidentally accomplishes the concealment of the means by which it secures results. The subscriber sees only his instrument upon the desk or wall, and is content to allow his knowledge of the equipment to go no farther than the piece of apparatus which makes the most obvious appeal for notice. He is, no doubt, aware that wires are run to the exchange; but, in places where these are exposed, the number in evidence in a single location is usually insignificant, and neither conveys an idea of complexity nor of costliness. Where aerial cable is used it is still less obtrusive than are open wires. Underground cable is completely out of sight, and receives practically no consideration. From an operating standpoint, the subscriber is accustomed to hearing the standard responses and challenges upon his line, and is rarely able to tell whether the exchange is in the hands of two operators or twenty. Only the obvious and prominent features of daily life strike attention and demand consideration, and the intricacy of a telephone system is far from being evident to an outsider.

A telephone company experiences much inconvenience from time to time arising from this state of insufficient knowledge. A number of these annoyances are due to complaints concerning service. A subscriber remembers every detail of incorrect connections and delays, and adds his grievances one to another until the sum seems to him unreasonable. Then a complaint is filed and the telephone company has to enter into a detailed explanation, and quite often undertake special investigations of the service. Busy reports on party lines in many cases are considered to be due to some neglect on the part of the company and the occurrences of unjust complaints that a line is falsely reported busy are by no means infrequent. Yet, in spite of his readiness to condemn the service, as the result of an occasional delay or inaccuracy, the subscriber seems to be extremely unwilling to cooperate with the company for the improvement of the advantages which it is able to offer. In many sections of the country the impatience of the subscribers, and their failure to comprehend the object of the work which is being carried on, has practically forced the abandonment of the method of taking service observations from subscribers' stations. The same lack of tolerance that makes itself so strongly felt in the operating department is observed in maintenance work.

While subscribers' complaints afford a check which assists a company to obtain the highest degree of perfection in its service, there are few officials who do not feel that it is impossible to avoid occasional errors, and that the dissatisfaction arising from these errors is altogether in unjust proportion to their frequency and the inconvenience which they cause. In many instances the remedy for this unusual readiness to criticize lies in the education of the subscribers. They should be taught that the company employs the services of numerous employees, every one of whom, although well trained, is liable to make an occasional mistake. It is an easy matter to convince the average person, by a proper presentation of the facts, that the number of such errors which affect each individual is surprisingly small, as compared to the immense amount of business handled in every well conducted exchange. A man who is familiar with the general lay-out of a wire plant realizes the complexity of the connections involved in putting through a call, and is likely to be much more tolerant of an occasional interruption. His sense of fair play will cause him to realize that a telephone company, which must experience many difficulties, is conducting its business with an efficiency which, as compared to other lines of work, is extremely high.

Although the simplest and most direct manner of conveying this information to a subscriber is by an exhibition of the property, and explanation of the method of doing work, it has been found that few people can be induced to leave their ordinary affairs for sufficient time to examine a telephone company's plant. The method which suggests itself after this as being the most satisfactory is the use of newspaper aricles. The publication in local journals of descriptions of a plant, with photographs showing its size and general features, should convey to the public the ideas which managers find it desirable to impress. This is interesting news, and at the time of a cut-over, or extensive improvements in construction, would undoubtedly be given a prominent place by almost any paper. The general condition of the service and the object of tests furnish the basis for instruction in another line. The public might well be educated in figures to such an extent that it would have a fair-minded appreciation of what is really good service from a general standpoint, and the publication of service records will be a means of promoting confidence.

This plan is being worked out to a certain extent in many places and the results obtained show that it produces a most agreeable effect. It is a form of advertising which is comparatively inexpensive. It goes far toward producing a feeling of personal association which is so substantial an assistance to the production of that most valuable asset—a satisfied subscriber.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

NUMBERING AND LETTERING TELEPHONE POLES.

Do you know of any cases bearing on the right of a common council to require telephone companies to number their telephone poles and designate them with initial letters so as to tell what companies the poles belong to? L. B.

IT has been held that the common council or other proper authorities under the municipality's police powers, have authority to require the numbering and lettering of poles belonging to telephone and electric light companies. Such a regulation is held to be a reasonable one because it assists the police authorities to properly regulate the use of the streets. Monongahela v. Monongahela Electric Light Co., 12 Pa., Co. Ct. 529.

DUTY TO PATRONS' CUSTOMERS.

Our company had some telephone apparatus installed in a grocery store and during an electrical storm a customer of the grocery man was injured by what he claims was the negligent escape of electricity due to our fault. Will you tell me whether we are bound to protect the customers of a patron of ours when we have a contract with the customer, and do not agree with the patron that we will protect his customers against accident? R. M.

THE courts hold that a duty is owed to the customers of a merchant in whose store a telephone is installed as well as to the store keeper himself, and that where a customer is injured by the negligent escape of electricity he can recover from the company. The editor therefore thinks that your defense does not lie along the line suggested, but that it would be better to rest your case upon the contention that you had taken all reasonable precautions to prevent accident.

INJUNCTIONS ISSUED IN FAVOR OF PEOPLE'S TELEPHONE CO.

THE Consolidated Telephone Company, of Clarksburg, W. Va., has petitioned Judge Mason for an injunction restraining the contractors at work on the extension of the Fairmont and Clarksburg Street Railway lines from further alleged destruction of the telephone company's property. The petition sets forth, that on June 6 a large tree was felled across the company's wires and that on July 21 the offense was repeated, and then a notice was sent to the contracting parties over the signature of Manager Barnes. It is reported that no attention was paid to the notice and after that date the offense was repeated at different times and has greatly damaged the business of the company.

The telephone company avers that the business of the Fairmont Coal Company has been threatened with a loss from one source amounting to $5,000 a year, besides a large amount of other business between Clarksburg and Fairmont and that the company has expended as much as $100 already for repairs of lines damaged by the railway company and that other losses will amount to $1,000 or $2,000. The petition also prays that a commission be appointed to ascertain the amount of damage and cause to be entered a decree in favor of the petitioner for that amount.

CONTROL OVER ELECTRIC SUBWAYS IN NEW YORK.

THE decision that has been handed down by the Appellate Division of the First Department of the State of New York, in the case of the West Side Electrical Company against the Consolidated Telegraph & Electrical Company, is gratifying to Independent telephone men throughout the United States. The contention of the defendant corporation, that authority to use electric conduits in the streets of New York City has been vested since 1887 in the Board of Aldermen, and not in the Board of Electrical Control, was sustained in the decision.

The action grew out of an effort on the part of the West Side company to restrain the Consolidated company, by injunction, from interfering with it in the laying of its cables in the conduits.

The opinion, written by Justice Patterson, with Justices O'Brien and Laughlin concurring, quotes the transportation corporation act of 1890, to the effect that a company, incorporated for the purpose of using electricity for light, heat or power, may provide and distribute electricity "with the consent of the municipal authorities." Justice Patterson added that the law of 1887, creating the Board of Electrical Control, vested in the latter merely powers of regulation as to the methods of using the subways, but did not give the board power to grant franchises. That power, he said, is still vested in the Board of Aldermen.

Justice Ingraham wrote a dissenting opinion, in which he held that the law of 1887 conferred much broader powers upon the Board of Electrical Control, and that within the powers to be exclusively exercised by the board is that of granting consent to the use of the streets of New York by a corporation to furnish electricity for lighting purposes.

Interest in this matter is now rather reminiscent, as there is no longer a Board of Electrical Control. Their powers have been vested by the Legislature in the Board of Aldermen.

BREAKING AND CONTACT OF WIRES.

AFTER a severe sleet storm that prevailed the greater part of the day a wire of the Pennsylvania Telephone Company in the city of Lancaster, Pa., broke and fell across the wire of an electric light company, the end lodging in a pool of water in the gutter. The pool of water became heavily charged with electricity and a horse led by its owner through the water received a shock, fell to the ground, where he came in contact with the "live" telephone wire and was killed. The man did not receive a shock because he wore rubber boots. He testified that he did not know the wire was in the water. The owner of the horse sued the company, but the court directed a verdict for the defendant. The case being appealed to the Superior Court, the plaintiff contended that no other evidence was necessary to make it a prima-facie case of negligence than that the wire broke and fell to the ground. The court in deciding against the plaintiff said that to hold as between a telephone company and one with whom it had no contract relation that a prime-facie presumption of the company's negligence is raised by proof that its wire broke under the strain of a sleet storm would require the court to go far beyond any previous Pennsylvania decision. The plaintiff further contended that the defendant was negligent in not maintaining guard wires to prevent the telephone wires, in case of their falling, from coming in contact with the electric light wires. On this point the court held that the answer of the company to the effect that plaintiff's statement contained no allegation on which to base it was well founded. The doctrine of *res ipsa loquitur* was also discussed.

The decision also held that a finding that the company was negligent because it did not learn of and repair this particular break of its wires within an hour and a half would be unreasonable. Aument vs. Pennsylvania Telephone Co., 21 Law Rev. 361.

IN THE OPERATING FIELD

WEST VIRGINIA WESTERN COMPANY HAS LARGELY INCREASED ITS EARNINGS.

PRESIDENT J. H. LININGER, of the West Virginia Western Telephone Company, in his annual report stated that the earnings of the company for the year just passed were $45,988.77, against $38,538.90 in the year 1904. The expenses were $31,382.57, against $26,944.16 the preceding year, and the profits were $14,606, against $11,594.74 the previous year. During the last quarter of the year 1905 the receipts of the company amounted to $12,498.08, which was nearly $800 more than for the preceding quarter and nearly $2,000 more than for any previous quarter. The president predicts that the receipts of the company this year will amount to $50,000.

Numerous extensions have been made during the past year. Switchboards for the exchanges at Newport, Matamoras and Friendly have been purchased and delivered. The line up the Ohio River, from Marietta to Sistersville, is well along and an order has been placed for the Sistersville switchboard. During the year the company put into operation a metallic copper line from Salem to West Union and hopes by spring to have it extended from the latter point into Parkersburg. It has also rebuilt the lines from West Union to Shirley and from West Union to Eagle Mills. A new line from Auburn to Cox's Mills, enabling connections to be made with Weston and other interior points by a more direct route than via Clarksburg, greatly improves the service to that section.

The total expenditure for extensions and new work during the year was $22,297.69, of which sum $18,140.06 was expended in the Parkersburg exchange, $868.06 in the various country exchanges and $3,289.57 on toll lines. Of the $18,140.06 expended in Parkersburg $5,725 was for a 760-line addition to the switchboard.

The most important toll connection arranged for during the year was with the U. S. Telephone Company, a contract having been made to connect with its lines at Parkersburg some time in this year. This connection will give unsurpassed service to all principal points in Ohio except Cincinnati, which at present has no Independent telephone system, Indiana and Michigan; also to Louisville, St. Louis and other Western points.

The board of directors of the company re-elected the old officers as follows: President, J. H. Lininger, of Harrisville; vice-president, J. E. Carle, Eatons; secretary, R. H. Rutherford, Zanesville, Ohio; treasurer, C. T. Hitshew, Parkersburg; general superintendent and office manager, A. C. Davis, Parkersburg.

SOUTH DAKOTA ASSOCIATION HOLDS MEETING AT SIOUX FALLS.

MEMBERS of the South Dakota Independent Telephone Association held their sixth annual convention at Sioux Falls on Jan. 10, 11, 12. This association has done some excellent work in aiding and developing the Independent movement. The systems represented cover nearly all of the State, and their management is in the hands of progressive men who are working for the best interests of the community at large.

The convention was called to order by the secretary, and an address of welcome was read by W. T. Doolittle. This was followed by the speech of the president, Hon. C. B. Kennedy, of Canton. Other addresses were made as follows: "The Independent telephone company," George W. Burnside; "Our duty to the public," J. L. W. Zietlow, of Aberdeen; "What constitutes deterioration," R. P. Crothers, of Hetland, S. D.; "The farmers' telephone company," M. B. Ryan, Beresford.

The evening session was held in the council chambers at the city auditorium, and the following subjects were discussed: "Would it be to the best interests of the public to compel telephone companies by law to connect with one another?" E. R. Buck, Hudson; "Telephone securities," C. C. King, Scotland; "How to handle three companies' business," T. F. Robinson; "Is it a benefit or detriment to have two exchanges in same town?" W. G. Porter, Sioux Falls; "Who is responsible for the adverse sentiment against existing exchanges?" J. A. Steninger, of Parker; "The relation of the supply houses to the telephone companies," W. G. Beiclehaupt, Aberdeen.

Every paper read brought forth a lively discussion, which had very beneficial effects. A banquet was held during the evening. On Thursday the general business session was held, and Friday was given up to an examination of the exhibits of several of the manufacturing companies.

The following are the officers of the association: President, Hon. C. B. Kennedy, of Canton; vice-president, J. A. Steninger, of Parker; secretary, H. P. Hartwell. Mayor Burnside, of Sioux Falls, is a member of the executive committee.

Amongst the delegates present were the following: P. C. Cockrill and C. H. Smith, Sioux City; W. G. Beiclehaupt and P. F. Zietlow, Aberdeen; J. O. Johnson, Lake Preston; E. L. Ketchum, Montrose; E. D. Julius, Davis; N. E. Gibbons, Yankton; A. P. Hoard, Alvester; T. J. Robinson, Pipestone, Minn.; H. T. Marris, Elk Point; Dr. E. R. Buck, Hudson; M. J. Burnette, Tyndall; C. C. King, Scotland.

PLANT AT OTTAWA, KANSAS, TO BE IMPROVED.

IMPROVEMENTS are to be made by the Home Telephone Company of Kansas City upon the plant at Ottawa, secured through the recently acquired control of the Ottawa Telephone Company. The plans include an addition to the present exchange building and the installation of a new switchboard, as well as a thorough reconstruction of the outside plant and new telephones for the subscribers. The estimates which have been prepared indicate that the cost of making preparations for the high class of service which is to be given by the Home company, will be in the neighborhood of $30,000.

NEW SYSTEM IN OPERATION IN BUCKS COUNTY, PENNSYLVANIA.

INDEPENDENT service in and around Bucks County, Pa., has been greatly extended by the opening of the new system of the Franklin Telephone and Telegraph Company at Springtown, Pa.

The territory covered by the company extends from Durham Furnace to Richlandtown with trunk lines running from Riegelsville to Quakertown, giving long distance connections at each of these places, as well as a trunk line to Bethlehem by way of Hellertown. By arrangement subscribers are given unlimited service with all telephones at Quakertown, Richlandtown, Applebachsville, Thatcher, Trumbauersville, Cressman, Milford Square, Shelly, Rosedale, Brick Tavern, Steinsburg, Zion's Hill, Rock Hill, Riegelsville, Kintnersville, Ferndale, Revere, Holland, Riegelsville, N. J., Milford, Finesville and Bloomsburg. The rates upon unlimited services in this territory are for residences $12 and business $15. The central office is situated at Springtown.

NEW KANSAS INDEPENDENT COMPANY REPORTS RAPID PROGRESS.

REPORTS to the stockholders by the officers of the Farmers' Telephone Company of Salemsburg, Kan., show that from the forty telephones connected at the time of its organization, nine months ago, it has grown to 182, with free communi-

Digitized by Google

cation with nearly 800. It now has 140 miles of wire and 1,874 poles.

The following board of directors for the coming year was elected: Gust Eckwall, Wm. Newick, C. O. Larson, Albert Anderson, Joe Bergquist, S. V. Pihl, Carl Magnuson, C. O. Kampe, A. Thelander and J. Anderson.

The officers elected are as follows: President, C. O. Kampe; secretary, A. Thelander; treasurer, A. W. Miller.

It was decided to erect a building large enough to make a comfortable home for the exchange force as well as to provide for the company's business.

REPORT OF DIVISION OF EXPENSES OF WISCONSIN INDEPENDENT COMPANY.

THE Monroe Telephone Company has recently voted to increase its capital stock from $25,000 to $36,000, to take care of the extensions made necessary by the natural growth of the company, and other expenses necessary for keeping up its standard of service. In the secretary's report were given the following figures, showing the division of expenses for the past year:

Construction	$1,086.18
Maintenance	1,936.68
Operation	3,178.57
	$6,201.43

The item of construction is divided as follows:

Labor	$403.69
Poles, arms and glass	42.68
Outside wire and materials	445.53
Freight and express	19.47
Drayage and livery	12.45
Switchboard and telephones	202.35
Inside materials	14.47
Sundries	34.02
	$1,174.66
Materials sold	88.48
	$1,086.18

The item of maintenance is divided as follows:

Labor	$2,223.89
Outside wire and materials	171.44
Inside materials and batteries	577.27
Poles, arms and glass	33.85
Drayage and livery	158.80
Freight and express	33.28
Sundries	20.20
	$3,218.73

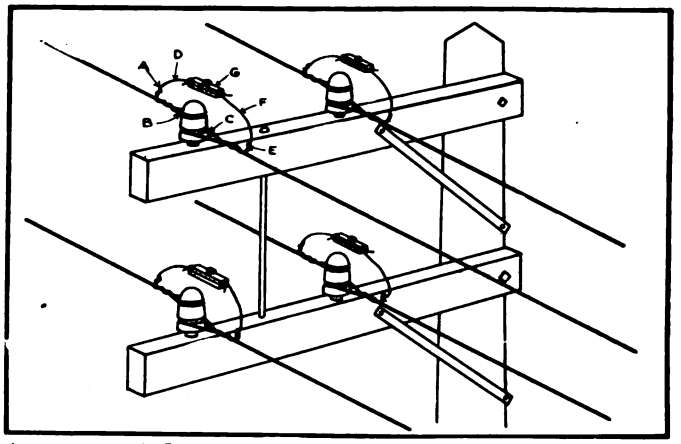
The report showed a net earning on the investment of over ten per cent., this percentage, however, including the amount set aside for reconstruction purposes. The previous board of officers were re-elected as follows: President, C. W. Twining; vice president, Dr. W. B. Monroe; treasurer, J. C. Penn; secretary, Frank A. Shriner; manager, P. J. Weirich.

A TEST POLE FOR RURAL LINES.

By G. W. Leyda.

FOR exchanges which have many farmers' lines connected, the use of a test pole at the city limits forms a very useful means of connecting the rural lines to the city wires. Where a heavy iron wire is used for farmers' lines the difficulty of making a test when the line has to be opened, and later a splice made for closing the connection, is evident to all managers who are familiar with these conditions. The method shown in the accompanying illustration has proved itself, after considerable experience, to be very satisfactory. It does not cause additional troubles and makes the opening and closing of the line for testing extremely easy.

As this plan is designed to be applied to a pole located at the city limits or thereabouts, in order that the farmers' lines may be definitely separated from the city leads, the wires should be dead-ended upon double grooved insulators. In making the dead end, the end of the wire should be left about one inch long projecting from the final turn of the spiral used for fastening. To this projecting end there should be soldered a soft copper



Arrangement of Connections on Test Pole. Line ties B, C, have long ends, A, E, to which are soldered copper extensions D, F. The line is carried through by connector G.

tie wire about fourteen inches long. Each of the four ends terminating upon the two insulators should be arranged in this manner. The copper wires for the city and country ends of the line may then be joined together by means of test connectors, allowing the line to be quickly opened and closed again after the test is finished. The use of the copper tie provides a flexible wire which can be bent into any desired form and very conveniently handled. If it is necessary, this form of construction makes it very easy to make a transposition at this pole. The use of this device is found to provide for as firm a connection as an ordinary joint, and effects a considerable saving in time.

HOME TELEPHONE COMPANY, OF HAMILTON, OHIO, REPORTS PROGRESS.

AT the annual meeting of the stockholders of the Hamilton Home Telephone Company the reports showed that during the last year the company has made many important extensions. It has put in 76 miles of poles in Butler County, has strung 20 miles of copper wire, laid 20,000 feet of cable and added 600 telephones. About 245 miles of iron wire have been put up. New exchanges have been built at Shandon and Trenton. With all these extensions and improvements the company earned about $50,000, and after paying all fixed charges, expenses and dividends, will still have a good surplus with which to enter upon the work of the new year.

There was no change in the board of directors and officers, which remain as follows: Frank Hughes, president; Charles E. Griesmer, vice-president; J. W. Sloneker, secretary; F. W. Whitaker, treasurer; W. Gilbert Thompson, manager; Sam D. Fitton, O. M. Bake, J. C. Slayback and F. M. Barden, directors.

ANOTHER BELL RUSE DEFEATED—CENTRAL UNION, LIKE CUMBERLAND, CONCEALS IDENTITY.

AT Spencer, Indiana, the New Long Distance Telephone Company (Independent) has been granted a franchise to establish both a local and toll line system. A local company has been organized and poles are being planted and wires strung for the new system.

The council granted this franchise to rebuke a deception practiced on the people by the Mugg Telephone Company and the Central Union Telephone Company. The business of the Mugg Telephone Company in Spencer has been taken over by the Central Union, but in order to appease the people they gave out the statement that the Mugg had taken over the business of the Central Union, and that the Central Union's office had been moved to that of the Mugg company. It is predicted that in a few months the New Long Distance company will have practically all the business in Spencer.

QUERIES

POLE SUPPORT FOR SWAMPY GROUND.—(654.)

Will you kindly tell me what method of construction is desirable in swampy land where the mud is too soft and too deep to give a solid bottom and firm support for a pole? R. F.

It is considered good practice to support poles in such locations and hold them in line by simply bolting to the foot of the pole two pieces of creosoted pine planking, crossing at right angles. This forms a very cheap support and one which is easily applied. It is sometimes necessary to reinforce the pole by putting in a push and brace, the foot being of the same construction as that for the base of the pole. An additional precaution is sometimes taken with lines exposed to strong winds. In this case a hole about the base of the pole is filled with concrete, which acts as a counterweight to assist in holding it upright.

Where neither of these methods could be applied on account of the extreme softness of the ground, it is customary to plant the pole and to bolt to it just above the ground and at right angles to the line, two pieces of planking about ten feet long. To these two planks are nailed short pieces of plank about three feet long, these planks being nailed at right angles to the ten foot plank. Four pieces of planking are then fastened, two on each side of the pole, extending from a point on the pole about five feet above the ground to each end of the before-mentioned ten foot plank.

With this form of construction the weight of the poles and line is distributed over a large bearing surface in such a manner as to not only prevent the line from sinking, but to brace it against a tension tending to tip the pole to one side.

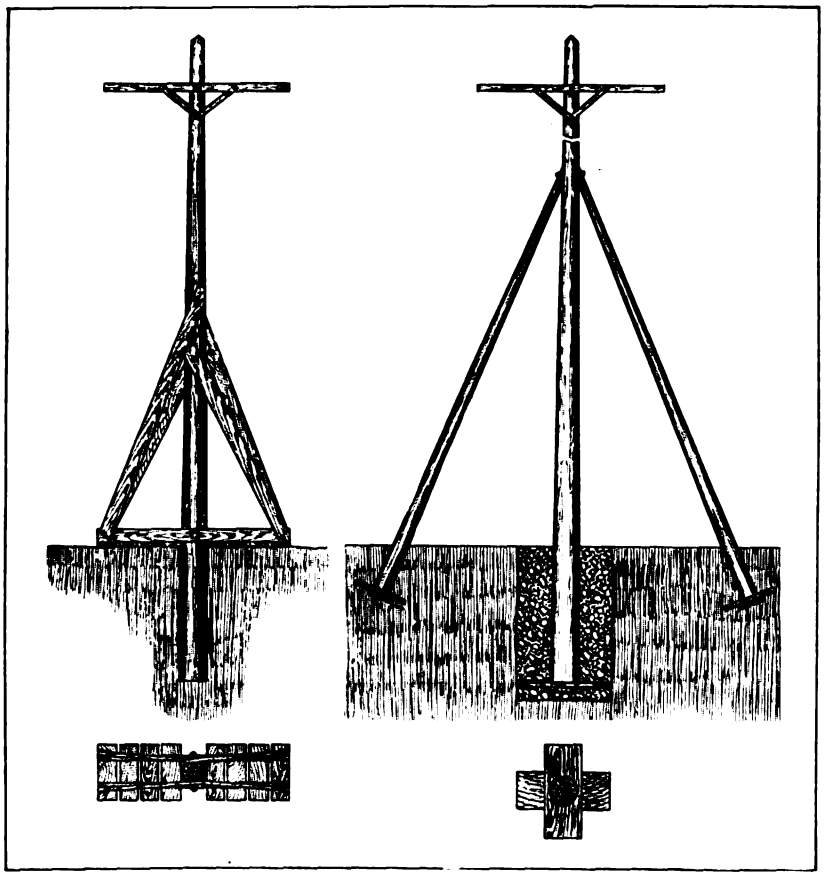

Fig. 654.

GROUNDING OF CENTRAL OFFICE BATTERY.—(655.)

Will you explain the reason for grounding the central office battery? F. J. C.

The grounding of the central office battery assists in preventing inductive disturbances on the line. It is also valuable to provide a point of constant potential to prevent stray currents from varying the potential at junction points. If the potential at a junction point is varied it causes a corresponding current to pass through every piece of apparatus connected to wires leading from the distributing point affected. In the case of transmitter circuits, for example, any variation in the potential at the fuse board is observable on all circuits and may produce serious annoyance. Another advantage lies in the protection of the battery from currents of high potential which might reach its terminals from an outside source.

JACK PER STATION SYSTEM.—(656.)

Is the plan of having a multiple jack for every station on party lines used extensively? F. C.

The use of a multiple jack per station is increasing in popularity in certain quarters. For two, four and ten party lines with semi-selective ringing the use of two jacks per line is common. In this case experience seems to indicate that the saving in ringing keys and time of operators more than offsets the extra expense of providing the jacks.

BUSY LAMPS.—(657.)

In the last issue of THE AMERICAN TELEPHONE JOURNAL it is stated that it is standard practice to connect 42-volt busy lamps on a 36-volt circuit. Will you kindly explain the reason for this? C. R. E.

Busy lamps are used in connection with the line multiple jacks in a toll board. Each toll line is normally connected to a multiple jack in front of each operator, and a busy lamp is associated with each lamp. As soon as the toll line is in use for the transmission of a message all the busy lamps for that line are illuminated and continue to burn until the connection is taken down. In this manner the condition of the line can be observed at a glance.

It is evident that if the lamps were supplied with the full voltage for which they are rated they would burn very brightly, and as each lamp is lighted for a considerable time and several adjacent lamps may be burning together, the amount of heat generated in a strip might be sufficient to soften the insulation in the mounting. On account of this the lamps are designed to reach their full brilliancy on a circuit of higher voltage than that on which they are intended to be connected.

USE OF PHANTOM LINES.—(658.)

I should like to know whether phantom lines such as you explained in a recent query, are being used extensively, or are still regarded as an experiment. A. R. L.

The phantom arrangement is being widely used in places where there are existing circuits which may be adapted to this form of circuit. It is necessary that the two lines should be similar and exceptionally well balanced and well insulated. The apparatus is simple and the question of installation is determined largely by considerations of economy in the handling of a known amount of traffic. In a case where there are periods when the amount of business is at times too heavy for the regular circuits, but not steady enough to justify an additional line, a phantom is the proper thing.

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE, CHEAP—600 pairs self-soldering protectors. Also one 300 pair and one 500 pair main distributing frame, used less than two months. Will sell separately or together. Address Virden Telephone Exchange, Virden, Ill., or Girard Telephone Exchange, Girard, Ill. 420

SUPPLIES WANTED

For use of operating companies wishing to purchase or sell second-hand equipment or supplies. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

WANTED—Second-hand telephones. State make of magneto, transmitter, receiver, style of backboard, time telephones have been in service. Address LaFayette Telephone Co., LaFayette, Indiana. 536

WANTED—Good second-hand 100 drop magneto switchboard with 50 or more drops installed. Must be in good condition and cheap for cash. Address Plymouth Telephone Co., Plymouth, N. C. 537

WANTED—One second-hand Sterling magneto switchboard. Give description, price and time in service. Address LaFayette Telephone Co., LaFayette, Indiana. 541

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

WANTED—Experienced telephone men of good appearance and address as traveling inspectors for the Engineering Department. We need men to fill vacancies caused by recent promotions. Address George J. Yundt, Engineer, Southern Bell Telephone & Telegraph Company, Atlanta, Ga. 530

A SQUARE deal is what we aim to render both employer and employee, when seeking the right man for a place, or the right place for a man. Without effort on your part, without endangering your present position, and without using your employers' time, we hunt up the position for which you are best qualified. Let us find the positon for you. Hapgood's, Suite 511, 309 Broadway, New York City. 464

WANTED—First-class salesman, calling on the telephone trade, can make big money by selling the best specialty on the market. Address Box 535, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 535

WANTED—Continued

ARE you working this? An important factor in creating new business in any line and in maintaining relations with the public is a publicity department. It moulds public opinion. Newspaper man, now holding responsible position, seeks change; vigorous, original writer; familiar with the requirements of public utility advertising; tactful and resourceful. Give me a personal interview and investigate my references. Address Box 538, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 538

DRAUGHTSMEN—Large Eastern telephone company requires several young draughtsmen who letter well, as tracers and designers on circuit, map, equipment, cable and general draughting. State age, education, experience and salary expected. Enclose a sample of your free hand lettering and of your draughting. Address Box 527, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 527

POSITION WANTED—Designer and model maker on telephone or other apparatus wishes position with a concern which appreciates a man that can do good work with his hands and brain. Address Box 539, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 539

WANTED—Position as Chief Solicitor or in the Accounting Department, by thoroughly experienced man of 35. Western states preferred. Address Box 540, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City 540

WANTED—Telephone salesman. A large telephone supply house located in the Southwest wants a first-class traveling man. As briefly as possible, give experience, references and description. Address Box 542, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 542

WANTED—An active partner with some money to put in a good paying telephone business. Owner is forced to take this action because of lack of capital to carry on rapidly expanding business. Address Box 543, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 543

WANTED—**Position to construct a new telephone plant** for an Independent company, of from 500 to 2,000 subscribers, with the prospect of superintending the plant and exchange after it is in operation. I am experienced in the business management as well as in the technical and construction part. Understand handling the general public. Have had fourteen years' experience in the business. Married and sober. Any company in need of a man in this capacity kindly address Box 318, Schenectady, N. Y. 544

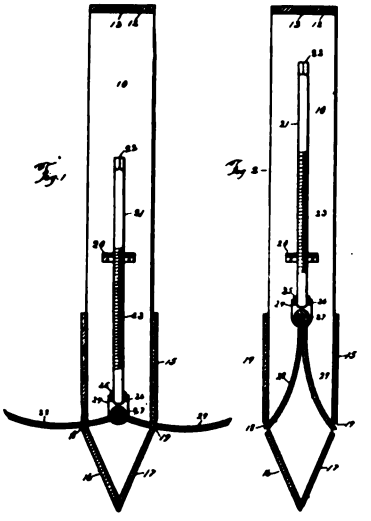
TELEPHONE PATENTS

ANCHOR POST.

Richard Wiltse, Grand Junction, Iowa, patents (No. 809,879, dated Jan. 9, 1906; filed Jan. 28, 1905; serial No. 243,590) an anchor post.

The object of this invention is to provide an anchor post which can be readily installed or removed. For this purpose the inventor employs two oblong members, 10, 11, which are joined together at the top by a plate 12, and at the bottom by a V-shaped



member 16, 17. Between the parts 14, 16 and 15, 17 are openings 18, 19, through which the arms 28, 29 may be thrust as shown in Fig. 1. The movement of these arms is controlled by a shaft 21 supported by a bracket 20 having a screw threaded hole which engages the threads 23 of the shaft. The anchor arms are pivoted at 27.

In operation the anchor post is driven into the ground at the proper angle. A crank shaft is then introduced through hole 13 and engages the top of shaft 21. The crank is then rotated, which causes the depression of the shaft, and the arms are forced outwards. When in the correct position the crank is removed. If at any future time it is found desirable to remove the anchor post the crank is employed to draw the arms into the post, when the latter can be readily withdrawn.

SELECTIVE PARTY LINE SYSTEM.

William M. Bruce, Springfield, Ohio, patents (No. 806,950; dated Dec. 12, 1905; filed April 3, 1905; serial No. 253,700) and assigns one third to James S. Brailey, Jr., Wauseon, Ohio, and one-third to Charles D. Juvenal, Springfield, Ohio, a selective system for party line telephones.

In this scheme the inventor shows a means whereby the controlling magnets of a selector mechanism may be operated without interference with the talking circuits. Each substation is provided with two magnets, one to operate a selector mechanism, the other to release it. Battery at the central station can be sent out over either or both sides of the lines to ground at will, and thus the mechanism may be operated.

LIGHTNING ARRESTER.

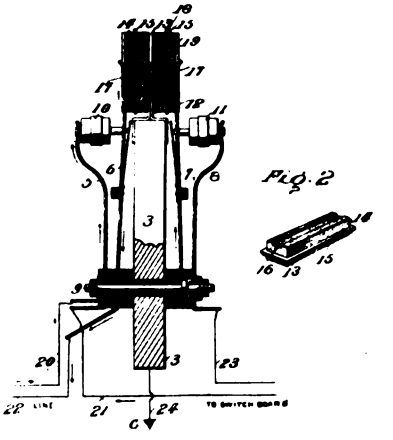
Frederick A. Stafford, Chariton, Iowa, patents (No. 808,882, dated Jan. 2, 1906; filed April 3, 1905; serial No. 253,605) a lightning arrester.

This arrester is intended for bridging lines only and is of the cut-out type. A switch is provided by means of which the instrument can be connected to the line or short-circuited to ground. A spark gap arrester is also employed. In general use the instrument is mounted on the outside of a building, and a rod with a handle which is employed to actuate the switch extended through to the inside. When the switch is in position to short-circuit the instrument any party attempting to signal will be made aware of the fact by the failure of his bell to ring, and would then move it into position to connect the instrument to the line wire.

CARBON PLATE FOR PROTECTIVE DEVICE.

Greenleaf Whittier Pickard, Amesbury, Mass., patents (No. 807,962, dated Dec. 19, 1905; filed April 14, 1904; serial No. 203,159: also a sub-division of the above, No. 807,963; dated Dec. 19, 1905; filed Dec. 21, 1904; serial No. 237,851) and assigns to the American Telephone and Telegraph Company of New York a protective device.

These patents disclose improvements in the manufacture of



the carbon blocks used for the discharge of high pressure currents which will prevent the formation of dust which tends to short-circuit the normal air gaps when a discharge takes place. This the invention accomplishes by immersing the blocks for thirty minutes in a solution of 1.4 pounds of resin to 4 gallons of turpentine at a temperature of from 150° to 160° Fahrenheit. This temperature is necessary to render the solution highly fluid. The blocks are then removed, drained and dried in air at a temperature of from 150° to 160° Fahrenheit for twenty-four hours, thereby evaporating the turpentine and leaving the resin as a binding material. After drying the carbons are ground in the usual way to remove the film and to leave a rough surface.

It has been found that blocks so treated do not leave a dust deposit after a discharge has taken place. The diagram shows the conventional arrangement for lightning protection, 17 being the fusible globule covered by patent No. 438,788 intended to fuse and short-circuit the air gap when subjected to the passage of continued discharges. The carbon plates 13, 14 are separated by the mica plate 15. This plate, of course, only partially covers the surface of the carbons, and it is to prevent the separation of dust from the exposed portions of the inside surfaces that this treatment is applied.

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

A NEW CABLE GRIP.

THE cable grip which is illustrated on this page presents advantages which should make it appeal forcibly to managers desirous of effecting economy in the drawing in of cables. This device is capable of being quickly adjusted to cable, and special designs provide for its use under varying conditions which arise in practice. After the grip has been applied to the cable, the application of tension draws the net work of wires over the surface so tightly that the manufacturers claim that slipping is impossible. At the same time the strands distribute the pressure over the surface of the sheath in such a way as to avoid any compression of the covering, with consequent lowering of the insulation. The device may be quickly applied to the end of the cable for ordinary work in drawing in. A feature which is valuable in this connection is a leather collar protector which may be fitted to single eye grips. Many conduits contain more or less sand, cement or grit, which tends to wear the grip, especially near the neck, and the use of this leather collar prevents this wear and increases the life of the parts.

For pulling out cable, or pulling in slack, the double eye grip is very useful. One form of this grip has been devised to open at the side, in order that it may be placed without cutting the cable. An illustration of this device in use is shown in Fig. 3. When the grip is applied to the cable the pole is used as a lever to draw out the cable gradually. The release of pressure causes the net work to slacken, and it may be readily pushed further along the cable to obtain a new hold.

As all the wires are carried around the ring the tension is evenly distributed, and there is no possibility of the wires pulling out or breaking from having to bear an undue proportion of the tension. The prices for this device are so low that its use is claimed to be extremely economical. In addition to the advantages derived from its applicability to many conditions which are imperfectly met by ordinary means, the rapidity with which it is adjusted will produce a considerable saving in labor on almost any class of work. It is useful not only for handling underground work, but it is especially recommended for use on aerial cable, which has to be drawn around corners, and on long pulls. This appliance is manufactured by the Universal Cable Grip Company, P. O. Box 390, Syracuse, N. Y., which will be pleased to furnish further information and prices to all persons interested.

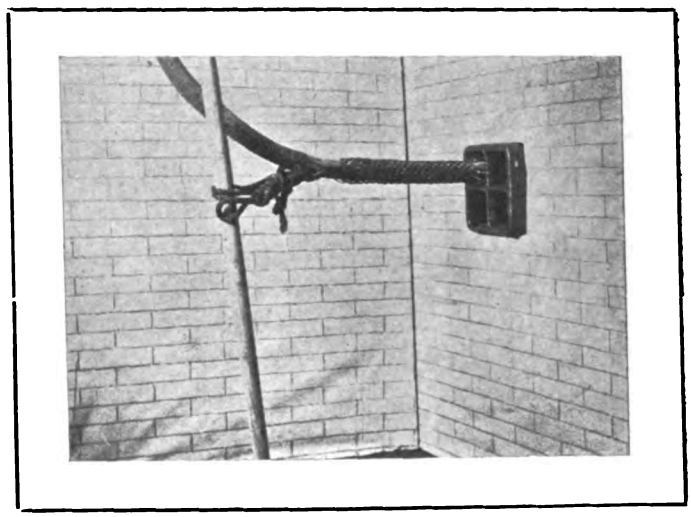

Fig. 3. Arrangement for withdrawing cable from manhole.

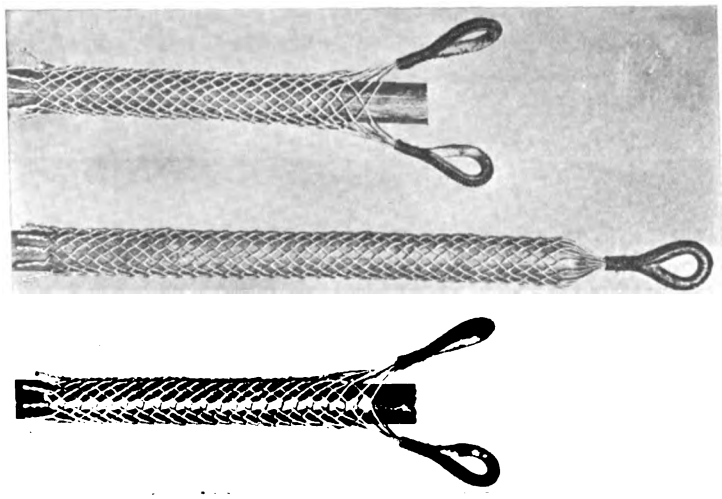

Fig. 2. Detail showing attachment of single and double eye grips.

THE CENTRAL TELEPHONE AND ELECTRIC COMPANY, St. Louis, Mo., is distributing the second of the series of very attractive monthly postal card calendars. All parties desiring to receive these cards from month to month are requested to send in their name, so that they can be placed on the mailing list and receive cards throughout the year.

THE BELDEN MANUFACTURING COMPANY, Chicago, Ill., is distributing its 1906 catalogue to the trade. Copies can be secured by addressing the firm and any further information will be cheerfully furnished by it. There are eight pages of wire tables. These will be found of great value in determining weight, length, resistance, etc., of any gauge wire. Amongst the different articles listed are copper wire, bare and insulated for magnet purposes, German silver wire, self-fluxing solder, switchboard wire, jumper wire, gas fixture wire, winding machines, revolution registers, flexible cords of all descriptions, terminal tips, and braided cotton sleeving. It is stated that separate electrical and chemical laboratories are maintained by the company under expert supervision and all raw material is subjected to severe tests before it is accepted. A coil winding department is at the disposal of the firm's customers and it will be pleased to quote prices. The catalogue contains much information not usually found in similar books.

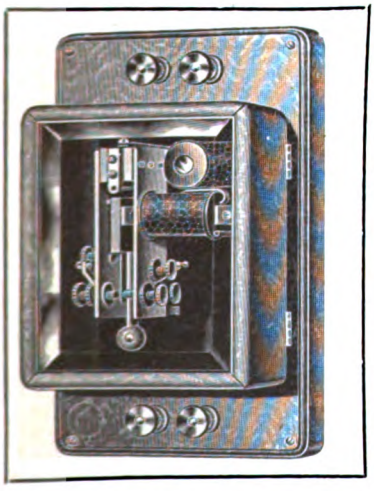
"DO YOU GET OUR RINGS"

NON-INFRINGING.

To Those of Our Customers Who Have Already Inquired and Those Who May Desire to Know:



That the Sandwich Pole-Changer, "while its appearance in the cut is strikingly similar to the Illinois," it is a very different and much better instrument. The Sandwich Pole-Changer Company is not the successor of the Illinois Electric Specialty Company. They simply purchased the tangible property of the Illinois Company last June, who had been doing business at a loss for several years, and this is the reason why *their suit went by default.*

The Sandwich Pole-Changer was put on the market by E. C. Hennis, who employed the most careful and able Patent Attorneys to see to it that this instrument was absolutely non-infringing, and it infringes no patent, then or since issued on Pole-Changers.

The Sandwich Pole-Changer Company is strongly backed financially, and is placing these instruments on the market by the hundred each month, and will protect the interests of its customers and users, as well as its own, to the end.

The Sandwich Pole-Changer is an up-to-date instrument made by the best of mechanics, of first class material. Sent on thirty days' free trial, and is in the market to stay.

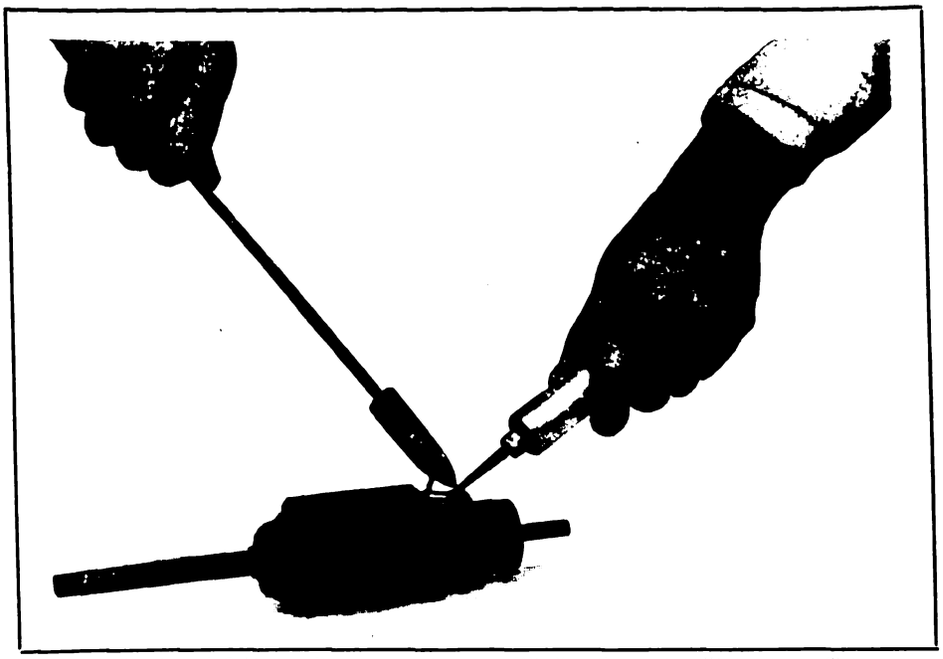
IN THE MANUFACTURING FIELD

AN ECONOMICAL SOLDERING DEVICE.

THE annoyance and loss of time resulting from the use of a soldering paste contained in an ordinary flat box are familiar to all telephone men. In order to do away with the difficulties experienced in using a separate instrument for picking up the paste and applying it to the surfaces to be connected, a tubular solder has been made, with the flux contained within the tube, and used with some success. The Climax Manufacturing Company, of Boston, Mass., has devised a method of overcoming this difficulty which may be seen at a glance to be extremely satisfactory in operation, and which it claims is more economical than the use of a tubular solder. The flux or paste is contained within a tube with collapsible walls, and can be squeezed out through the opening of the tube, and directly applied to the surface upon which the solder is to be placed. The application of a heated copper causes the flux to melt and flow evenly over the surface as it is forced from the tube.



Application of Soldering Paste to an Armature Winding Connection With Climax Tube.

Amongst the important advantages claimed for this method of procedure is the fact that it is a very easy matter to squeeze out just the right quantity of flux, and apply it to the proper point on the work in hand with a single motion. The troubles which come from the use of too much paste are also easily avoided, and the disadvantages observed when a box of paste is left open on a bench, due to the accumulation of dirt, or the daubing of tools which may accidentally come in contact with the uncovered surface of the paste, are done away with.

This tube may be carried in the pocket ready for instant use, and this is of marked advantage when wires are to be soldered overhead. The company claims that the paste used in the tubes is of exceptionally good quality, and non-corrosive.

An interesting mechanical detail embodied in this apparatus is the aluminum tube. This allows of the paste being applied directly to the joint while the joint is heated, without soldering up the vent. The manufacturers will be pleased to furnish additional information and prices upon receipt of requests.

THE BAIRD MANUFACTURING COMPANY, 6 Michigan street, Chicago, reports that the Hanamo Telephone Company, of Maitland, Mo., is installing the Baird secret-service system on its party lines. The Hanamo Telephone Company, of Marysville, Mo., is also installing this system.

ALBERT J. COX, Suite 1,214 Chicago Stock Exchange Building, Chicago, Ill., is distributing a pamphlet descriptive of his business as a purchasing and distributing agent. The pamphlet is entitled "Economy of Buying." His work is stated to be the reducing of cost of raw and finished materials to the telephone companies, made possible by the buying of large quantities at one time. Mr. Cox was for years associated with the Western Electric Company and the experience gained has enabled him to purchase materials which will conform with standard specifications.

THE ELECTRIC GAS LIGHTING COMPANY, BOSTON, CHICAGO, TORONTO AND SAN FRANCISCO, is attracting considerable attention to its line of interior telephones by a series of mailing cards, each of which is used to convey some very pointed paragraphs respecting interior systems. This firm manufactures several different types, each of which is suitable for some particular work. In every case the apparatus has been designed for hard usage without the necessity of frequent repairs. The company will be pleased to place the names of parties interested on its mailing list, whereby they will be able to receive all bulletins, cards, etc., immediately after publication.

THE ROCK ISLAND BATTERY COMPANY, Cincinnati, Ohio, had the misfortune to lose its entire plant by fire on Jan. 11. The only articles saved were the books and records. While the fire was still in progress, a meeting of the directors was held and it was decided to at once start operations on a larger scale. On the 13th a new factory building at Ninth and Sycamore streets was leased and the work of installing new machinery commenced at once. So rapid was the progress of reorganization that the firm announces its ability to make deliveries of the Rock Island dry cell at the present time. It is now in a position to handle a much increased business, and on account of enlarged machinery can make very quick deliveries. The company will be pleased to quote prices and furnish further particulars upon request.

MR. E. H. VALENTINE, president of The Valentine-Clark Company, Chicago, dealers in cedar poles, etc., in pursuance of a resolve made many years ago to retire from active business at his present age, has disposed of his interests in that company to Mr. E. L. Clark, formerly secretary and treasurer. Mr. Clark now succeeds to the office of president, the corporate name of the company continuing as heretofore. The Valentine-Clark Company has long occupied a prominent position in the cedar industry and enjoys an extensive volume of business in all lines of electric construction requiring the use of poles for power transmission. Mr. Clark has been identified with the company since its formation, enjoys an extensive acquaintance with producers and consumers, and possesses an intimate knowledge of the trade in all its details.

GHIGAGO

THE VALUE OF A MEASURING INSTRUMENT

Suppose you have a line in trouble—grounded or open. You don't know the exact location, but you send out a troubleman to hunt it up and clear it. It may take him an hour or a day. Meanwhile the subscriber is getting hot under the collar and saying things about telephones in general and yours in particular.

If you have a Pignolet voltmeter or volt-ammeter you can determine the approximate location and also get an idea of the nature of the trouble. With the information your troubleman can find the fault in jig time, and you will have prevented the subscriber kicking by giving him service at the earliest possible moment.

Does it pay to be informed? You ought to know.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit
78 CORTLANDT ST., N. Y.

Digitized by Google

FINANCIAL.

BENSON, ILL.—The Benson Telephone Company has increased its capital stock to $12,000.

COUNCIL BLUFFS, IA.—The Council Bluffs Telephone Company has increased its capital stock from $100,000 to $500,000.

NEVADA, IA.—The Mutual Telephone Company has declared a dividend of 2½ per cent.

LEXINGTON, KY.—The Fayette Home Telephone Company has declared a quarterly dividend of 1½ per cent. on its preferred stock.

CADILLAC, MICH.—The Missaukee Telephone Company has increased its capital stock from $5,000 to $20,000. In addition to the regular quarterly 2 per cent. cash dividend, a special stock dividend of 6 per cent. has been declared. The company is to purchase the Lake City Telephone Exchange, now owned by N. N. Peck and G. S. Stout. Officers of the company are: H. S. Lamb, president; Fred Rose, vice-president; N. N. Peck, secretary and treasurer; G. S. Stout, general manager.

MARQUETTE, MICH.—The Sagola (Dickinson County) Telephone Company has declared a dividend of 5 per cent. The officers of the company are as follows: J. J. Clark, president; Paul de Champlain, vice-president; T. J. Dewish, secretary and treasurer.

DENTON, MD.—The Farmers' and Merchants' Telephone Company has increased its capital stock to $25,000.

AUSTIN, MINN.—The Interstate Telegraph and Telephone Company has increased its capital stock from $20,000 to $30,000.

CLEARWATER, MINN.—The Clearwater Telephone Company has declared a dividend of 10 per cent. for the year 1905.

MINNEAPOLIS, MINN.—The directors of the Twin City Telephone Company have declared the sixteenth quarterly dividend at the rate of seven per cent. per annum on the preferred stock.

WAYNE, N. Y.—The Wayne-Monroe Telephone Company has declared a dividend of 1½ per cent. on its capital stock.

ASHLAND, O.—The Star Telephone Company has declared a dividend of 6 per cent. The company has exchanges in twelve other places besides Ashland.

CRIDERSVILLE, O.—The Cridersville Telephone Company, Cridersville, has increased its capital stock from $5,000 to $25,000.

WEST UNITY, O.—The Citizens' Telephone Company, of West Unity, has increased its capital stock from $50,000 to $60,000.

FRANCHISES.

STEPHENS, ARK.—Messrs. T. A. and G. Lewis have been granted a franchise to construct a telephone system at Stephens.

WYMORE, NEB.—The city council of Wymore has granted to Frank M. Smith a franchise for an Independent telephone system. A modern plant will be installed, and toll lines built to connect with the Home Telephone Company's exchange at Beatrice, Neb.

PEOLI, O.—The Peoli & Gilmore Telephone Company has been granted a franchise to construct a telephone system.

SUNNYSIDE, WASH.—The Independent Telephone Company has applied for a franchise at Sunnyside.

COMBINATIONS.

FERTILE, MINN.—The telephone line to Bermidji from Fertile has been sold by the Fertile Telephone Company to the Polk County Telephone Company. The new company intends to build several new lines.

OSCAR, MINN.—The Oscar Telephone Company is to connect with the Barb Wire Telephone Company at Carlisle.

KAHOKA, MO.—The Hubinger telephone plant in Kahoka has been purchased by Thomas Peebles of Minnesota, and the name changed to the Gate Telephone Company. The plant will be put in first class condition.

WORCESTER, N. Y.—The Davis and Rose Telephone companies have consolidated and in the future will be operated under one management. The company is not yet named. It is capitalized at $30,000. Under the new management the Worcester Exchange will be rebuilt and rural lines run to Decatur, South Valley, East Worcester and other points.

CALDWELL, O.—The Caldwell Independent Telephone Company, of Caldwell; the Farmers Telephone Company, of Caldwell; the Summerfield Telephone Company, of Summerfield, three of Noble County's telephone companies, with a combined business of 1,000 telephones, have consolidated and will be operated under the name of the Noble County Telephone Company.

CENTERVILLE, PA.—The Home Mutual Telephone Company of Centerville, and the Home Union Telephone Company of California have made connections and are giving service over each other's lines.

ELECTIONS.

NASHVILLE, ILL.—The Nashville Mutual Telephone Company has elected the following officers: President, Jos. McDowell; vice-president, Fred Stark; secretary, Garfield Law; treasurer, Frank Meyer; trustee, Ben Meyer.

PITTSFIELD, ILL.—At a recent meeting of stockholders of the Farmers' Telephone Company H. T. Shaw, of Martinsburg, was re-elected president and J. F. Lacy secretary.

BICKNELL, IND.—The Bicknell Telephone Company has re-elected all its old officers, as follows: President, Joseph Barr; manager, W. D. Lemen, Treasurer, Frank McClure; secretary, John Hoover.

BORDEN, IND.—The Farmers' Union Telephone Company has elected the following officers: J. G. Scott, president; Walter Scott, vice-president; Jefferson Johnson, secretary; George L. McCutcheon, treasurer.

COLUMBUS, IND.—At the annual meeting of the Citizens' Telephone Company, Thomas D. Sheerin was elected president; C. S. Norton, vice-president; M. S. Hosea, secretary and treasurer. The old board of directors was re-elected.

DILLSBORO, IND.—The Dillsboro Telephone Company has elected the following officers: F. M. Sale, president; Geo. P. Heffelmeyer, vice-president; Fred Lubbe, secretary, and G. H. Elderbrook, treasurer. A modern plant will be established.

MULBERRY, IND.—Stockholders of the People's Co-operative Telephone Company, at their annual meeting elected the following officers: President, Allen Troxell; secretary, George H. Miller; treasurer, James M. Sims. The company now has more than 400 subscribers, with many on the waiting list.

PRINCETON, IND.—The Independent Telephone Company has elected the following officers: R. N. Parrett, president; J. W. Ewing, treasurer; C. F. Stevens, secretary; F. R. Parsons, manager.

RICHMOND, IND.—The annual election of officers for the Richmond Home Telephone Company occurred January 24, resulting in the selection of A. C. Lindermuth, president; E. H. Gates, vice-president; J. W. Moore, secretary; W. P. Orr, L. M. Flesh, and W. M. Bailey, directors. During the past year there was an increase of 300 subscribers, bringing the number up to 5,000. A proposition to consolidate all the Independent companies in Wayne county was discussed at the meeting and it is probable that such action will be taken soon.

NEW COMPANIES.

GRIDLEY, ILL.—The Fifer Telephone Company, of Gridley, has been incorporated with a capital stock of $1,800. Incorporators: C. F. Hobbler, Alexander Helbing and William Killian.

KINSMAN, ILL.—The Kinsman Independent Telephone Company has been incorporated with a capital stock of $2,500. Incorporators: W. D. Lindsay, Thomas Drinan and E. J. Phelan.

PALOMA, ILL.—The Central Exchange Telephone Company has been incorporated with a capital stock of $2,500. Incorporators: J. B. Henry, O. H. Lawless and Joseph Dickhut.

NEWS—WANTED

THE matter contained upon the Message and Operating Field pages of this paper is contributed largely by our special correspondents. We believe, however, that there are many valuable items of telephonic interest which are never brought to the attention of the public. There is no reason why this condition should exist, and the Editor, therefore, invites all telephone companies and the officials of such companies, to furnish any information that they can consistently make public relative to financial statistics, new construction, elections, franchises and personal items.

OUR MOTTO—QUALITY AND PROMPT SHIPMENTS.

KELLOGG "MICHIGAN WHITE" CEDAR POLES

THE poles we handle are all carefully selected, and are the best grade of stock.

All shipments are prompt, subject only to car supply.

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices.

We have recently published a little book giving some very valuable information about Cedar Poles. It contains Specifications, Inspection Comments, Shipping Data, Etc. "Yours for the asking."

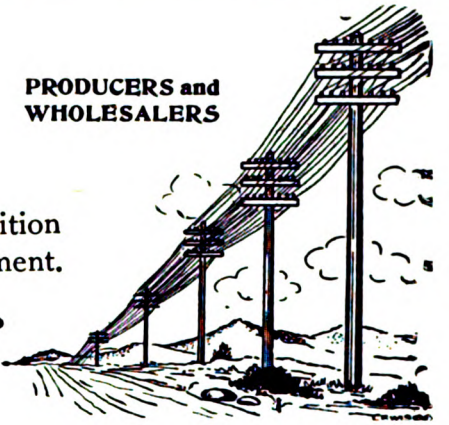
KELLOGG SWITCHBOARD & SUPPLY COMPANY - - - CHICAGO ILL.

PITTSBURG & LAKE SUPERIOR IRON CO.,
ESCANABA, MICHIGAN.

PRODUCERS and WHOLESALERS

WE always carry a large stock of all sizes of White Cedar Poles, and having yards on all principal railroads in Northern Michigan and Minnesota, are in position to make immediate shipment.

"From the Stump to the Line."



CEDAR POLES

Upon a foundation of SQUARE DEALING we have built a pole business excelled by none. Our reputation is of more importance than your order, therefore if you buy from us, you will be assured of getting what you want.

We solicit your orders and can please you in quality and prompt shipments.

THE WEEK'S MESSAGES

PRIMGHAR, IA.—The Primghar & Center Township Telephone Company has been incorporated with a capital stock of $500. Incorporators: J. C. Mies and others.

ROCK VALLEY, IA.—The Klein Rural Telephone Company has been incorporated with a capital stock of $2,000. Incorporators are J. E. Quintan and others.

GARNETT, KAS.—The Garnett Telephone Company has been incorporated with a capital stock of $25,000.

WEST COMANCHE, KAS.—The West Comanche Telephone Company has been organized and will build a line to Ellinwood.

BERNICE, LA.—The Bernice Telephone Company has been incorporated with a capital stock of $5,000.

LEONARD, MICH.—The Leonard Telephone Company has been incorporated with a capital stock of $2,500. The principal stockholders are G. B. Dewey and W. G. Poole, of Oxford, and Geo. E. Snyder, of Ovid.

TRUMAN, MINN.—The Armstrong Telephone Exchange Company has been incorporated with a capital stock of $100,000. The officers are: W. L. Hoover, president; John Robinson, vice-president; R. O. Armstrong, secretary and treasurer.

INVALE, NEB.—The Farmers Creek Telephone Company has been incorporated with a capital stock of $3,500. The incorporators are I. O. Walker, C. L. Olmstead and others.

PERRYSBURG, N. Y.—The Perrysburg Telephone Company has been incorporated with a capital stock of $5,000. The incorporators are B. H. Graves, A. W. Powers, Perrysburg; D. L. Stafford, Gowanda.

CLARIDON, O.—The Claridon Telephone Company has been incorporated with a capital stock of $5,000. Incorporators: A. A. McNish, H. D. Morgret, Eugene L. Wilmot, N. J. Wilmot and A. L. Bruce.

CLARKSFIELD, O.—The Clarksfield Telephone Company has been incorporated with a capital stock of $9,500. Incorporators: E. E. Rowland, Dennis Ross, John McDonald, F. E. Meeks, C. A. Whitney and S. C. Helfner.

FISHER, O.—The Farmers Telephone Company, of Fisher, has been incorporated with a capital stock of $2,500. Incorporators: N. Dalton, R. M. Patterson, J. O. Harner, H. D. Hooper and Julian Gift.

HASKINS, O.—The Haskins Telephone Company has been incorporated with a capital stock of $10,000. The incorporators are H. A. Twining, L. A. Challen, H. J. Johnston and F. W. Heald.

WASHINGTON, O.—The Washington-Brady Telephone Company has been organized with the following officers: President, H. M. McCracken; secretary, C. W. Stockdale; treasurer, J. J. Griffith.

PERSONAL.

JOHN FULLMER, of Portage, Wis., has taken charge of the Kilbourn Inter-County Telephone Company's plant, and will have full management.

WILLIAM McCALL has been appointed vice-president and general manager of the New Cambria Telephone Company at Salina, Kas.

R. S. SKILCH, Montreal, has been appointed consulting engineer for the municipal telephone plant the town will build at Edmonton, Alberta, Can.

J. T. TURNER, formerly manager of the Central Union Telephone Company's exchange in Effingham, Ill., has taken the recently vacated position of manager for the Wabash Valley Telephone Company in the same city.

MISCELLANEOUS.

PARAGOULD, ARK.—Charles A. Miller and associates contemplate organizing a company with $10,000 for the construction of a telephone system.

BLUE RIDGE, IND.—The Blue Ridge Telephone Company is not to be acquired by the Bell Company, as was rumored, but is to make arrangements with the New Long Distance Company, of Indianapolis, to use the latter company's poles for a metallic circuit. The Blue Ridge Company, of which Mr. W. H. Ensminger is the proprietor, is to rebuild the plant and put a new exchange in at St. Paul.

MUSCATINE, IA.—The Trunk Line Telephone Company, whose line extends from Flat Iron Point to Muscatine, is to be incorporated.

TOLEDO, O.—The Toledo Home Telephone Company has installed a new private exchange at The Tavern, the switchboard being equipped with service for about 70 telephones and two trunk lines in the popular hostelry. The company also has contracts for installing a private exchange for the Landerson-Basch Abstract Company and the J. F. Zahm Tobacco Company. The business of the company is increasing at a rapid rate, in the neighborhood of 300 new telephones being installed per month. For the first week in January 70 new contracts were secured, while for the second week of the month 65 new contracts were signed.

New Construction in the Field

MOBILE, ALA.—The Eastern Shore Telephone Company, recently absorbed by the Home Telephone Company, is to have it's system extended and is to make connection with the Independent Long Distance Telephone Company at Bay Ninette.

CORONA, CAL.—The Corona Telephone Company has commenced the construction of its system.

NEWBERRY, FLA.—The East Florida Telephone Company is building a line from Newberry to Taylor.

BORDEN, IND.—The Farmers Telephone Company, of Borden, is extending its lines to Mooresville.

EMERSON, IA.—The Mutual Telephone Company is to build a line from Emerson to Hastings, also one to Glenwood.

LEON, IA.—The Leon Telephone Company is making many improvements in its system.

TAMA, IA.—W. C. Fidler, owner of the telephone plant at Tama, is to make many improvements in the system and contemplates the acquisition of the Toledo exchange.

ELIZABETHTOWN, KY.—The Hardin County Telephone Company is to build a number of new lines and make many improvements.

HINDMAN, KY.—The Beaver-Hindman Telephone Company is extending its line from Hindman to Colson, where connection will be made with the Whitesburg Telephone Company. The Whitesburg Telephone Company's lines are also being extended to all parts of the county.

SHARPSBURG, KY.—The Sharpsburg Telephone Company is extending its lines.

CORINNA, ME.—The Corinna Telephone Company is to extend its lines to Lincoln's Mills.

WEST STOCKBRIDGE, MASS.—The Berkshire Mutual Telephone Company is to extend its lines to Housatonic.

ALLEGAN, MICH.—The Citizens' Telephone Company is running a copper metallic toll line from here to Hamilton to connect with a line from that place to Holland, doing away with the relay service through Grand Rapids.

LAKE ODESSA, MICH.—The Citizen's Telephone Company has completed a new copper line direct to Ionia.

ARROW ROCK, MO.—The Arrow Rock Telephone Company contemplates building a number of new lines.

MESABA, MINN.—The Mesaba Telephone Company, having secured permission to extend its line from Grand Rapids to Deer River, will commence work at once.

CANTERBURY, N. H.—The Boscawen Telephone Company is to build a line to the North Concord Station.

ELLICOTTVILLE, N. Y.—The Ellicottville Home Telephone Company is to build a line to Franklinville, Machias and Arcade.

PITTSTOWN, N. Y.—The Pittstown Telephone Company is to make many extensions to its lines.

ATHENS, O.—The Athens Telephone Company intends to make many improvements to its system.

BELLEFONTAINE, O.—The United Telephone Company is to build new lines out of DeGraff, West Liberty, East Liberty and West Mansfield.

McCOMB, O.—The Mutual Telephone Company is to build a line from McComb to Deshler.

MARIETTA, O.—The Marietta Telephone Company is to spend $50,000 in improving its system.

HARRISBURG, PA.—The United Telephone Company, of Harrisburg, is to build a line between Tamaqua and Mauch Chunk.

REDBANK, PA.—The Redbank Telephone Company has under consideration the building of a trunk line from Summerville to Kingsville, via Crates and Shannondale.

HERMOSA, S. D.—The Hermosa Telephone Company is to build a line from Hermosa to Keystone.

SADLER, TEXAS.—The Grayson County Telephone Company is putting in a line from Sadler south to the main line from Whitesboro to Sherman.

BRECKLETON, WASH.—R. E. Jackson and others are to build a telephone line from Breckleton to Cleveland.

MAZATLAN, MEX.—The telephone system belonging to the company of which Arthur de Cima is the head is to be rebuilt. A special system for the exclusive use of the police, with telephones at various points along the streets, will be installed.

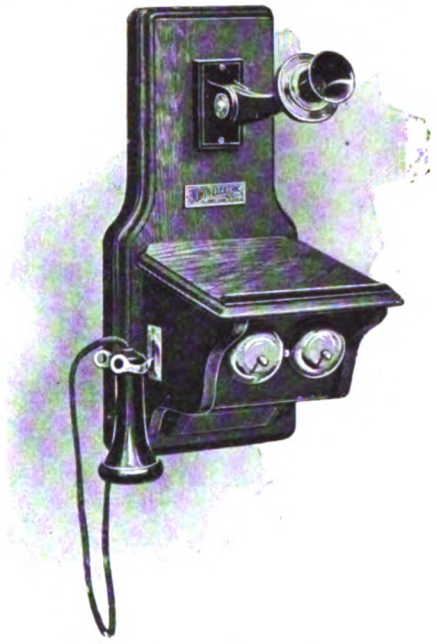
NORTH COMMON BATTERY TELEPHONES



The hinged front of "NORTH'S" common battery wall type telephone renders the condenser and instrument wiring accessible without removing from the wall.

The cabinets are not veneered, but every stick of lumber is from a veneered mill; for they handle nothing but the most beautifully figured woods. The stock is 18 months old, kiln dried 30 days and given a hand-rubbed finish involving 7 processes.

They are equipped with the following standard parts, and will operate on any standard common battery system.

"NORTH'S" Solid Back Transmitter that combines ample volume, perfect articulation, deep penetration and natural pitch.

"NORTH'S" Permanently Adjusted Receiver. The diaphragm does not rest on the outside shell, but on a bell-shaped metal seat—it isn't thrown out of adjustment by unequal expansion of hard rubber and magnet metal.

"NORTH'S" New Ringer, provided with a knife-edge, weighing-scale bearing armature—it can't tighten or drop out of place.

"NORTH'S" Horizontal Lever Adjustable Tension Switch-hook with long flexible contact springs—they can't break or become misplaced, and always resume their normal positions.

The parts are individually tested—the transmitter by an engineer. There are two inspections during assembling, a final test on completion and again a test before shipping—just to make sure.

CENTURY

100 % GOOD

OUR MAGNETO DROPS

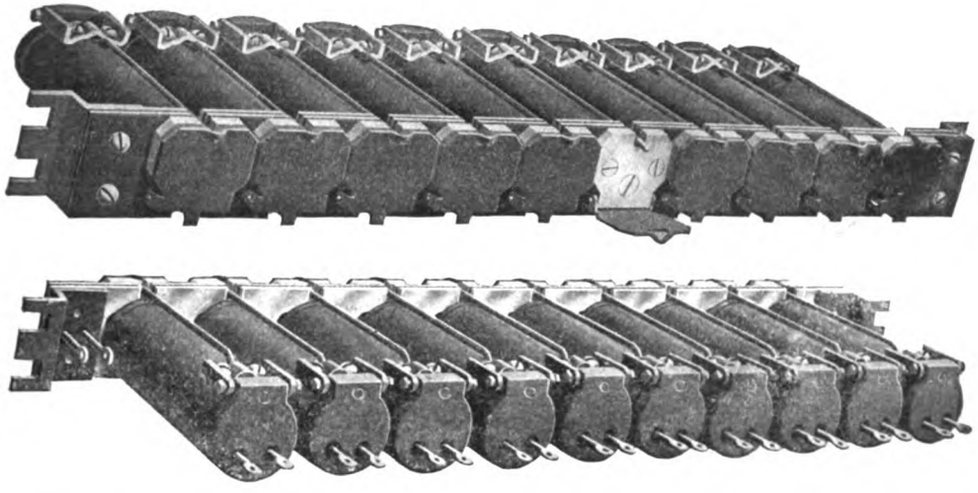
are mounted ten on a strip,—separate from the jacks

Any drop can be removed by taking out one screw from the front.

The drop coils are enclosed in an iron tube. This tube is made of high grade Norway iron, electrically welded.

The Tube and Armature are copper plated and lacquered.

Only silk covered wire is used in winding the coils, the wire being the largest size that can be used to obtain the required resistance.



Night bell contacts on our drops can be relied upon at all times. The back plate of the mounting strip is one side of the night bell circuit and the shutter strip is the other side. The shutter in falling, comes in direct contact with the back plate, enclosing the circuit.

Let us quote you prices on your new magneto switchboard. We will send sample parts for your inspection.

CAN WE INTEREST YOU IN OUR NEW 4-PARTY SELECTIVE SYSTEM FOR MAGNETO EXCHANGES? ABSOLUTELY RELIABLE.

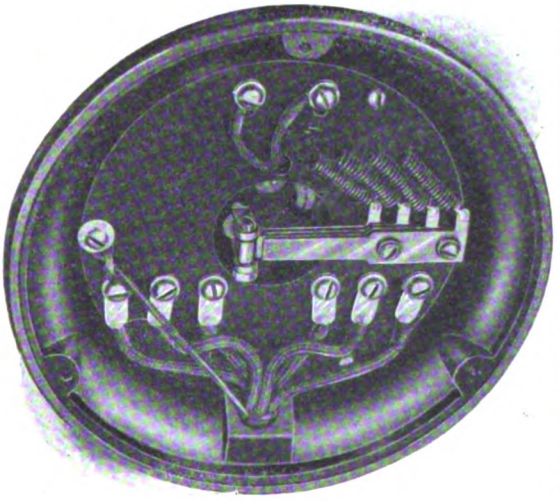
MONARCH APPARATUS

THE DESK SET



All wiring of a Monarch Desk Stand terminates in the base. The transmitter connections are metallic, and are brought down in two conductor silk cord. The hook switch springs being mounted upon the base, no other wiring passes through the pedestal tube. The connecting plate is made of hard rubber. All connections are plainly marked. Clips are provided for the receiver and connecting cords. All connecting plates are interchangeable. Local battery desk sets can be made to common battery by changing the connecting plates and transmitters. All Monarch Telephone Apparatus is described in the new catalogue. A copy will be sent upon request.

SIDE BRACKET

Patented

TYPE A—10-Pair Hall Cable Box.

CABLE TERMINAL EFFICIENCY.

A great deal of the efficiency of a cable plant depends upon the terminal and distribution facilities. And what is more, the type of terminal is of the greatest importance. Some of the points to be considered in its selection are protection, "getatability," compactness, rigidity. Considering these features collectively or individually you cannot find a terminal on the market that is superior to the HALL. Protection was given the greatest attention in its design so that when you buy a

HALL CABLE TERMINAL

you have bought protection against lightning, sneak currents, or crosses with dangerous circuits. The "getatability" of the Hall is unique. When the cover is taken off the top, bottom, front and back are exposed. No opportunity here for faulty inspection.

Compactness? Just look at the illustration. That tells its own story.

Rigidity? An all-metal framework carries the terminal plate. We couldn't make it stronger if we tried.

Seems to us you ought to get prices. Your name and address will bring them, and some more facts that will be of value to you.

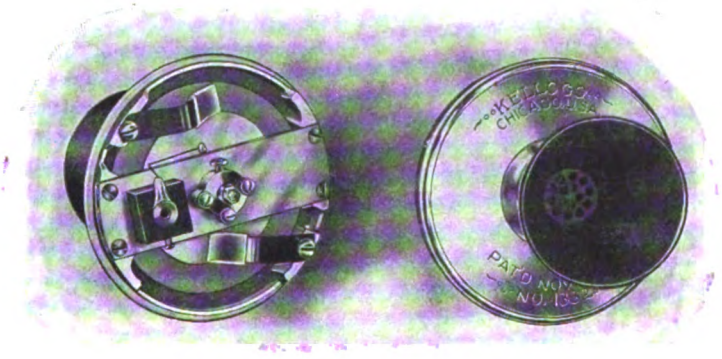
A Kellogg Transmitter, once installed, never needs to be replaced.



BACK VIEW. FRONT VIEW.

Every telephone company has come to know that the transmitter is the most vital part of the entire system.

If a transmitter "falls down" and has to be exchanged, it is not the financial loss that counts, but it is the dissatisfaction of the subscribers that hurts the telephone company, and this dissatisfaction of the subscribers cannot be expressed in dollars and cents.

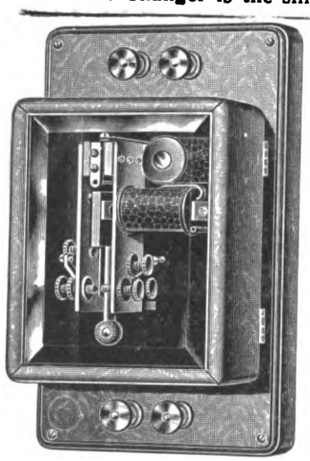
SIMPLICITY

is the Keynote of Success

A simple device which accomplishes the same results as a more complex one is certainly more preferable. The Sandwich Pole-Changer is the simplest device ever constructed for ringing purposes. There are but three contact springs and as these engage alternately with their opposite sides they cannot be forced out of position by constant use.



It requires no adjustment, as this is done at the factory and is permanent.

The use of a primary constant current battery to operate the vibrator has been dispensed with; a minute quantity of current, hardly a milliampere, being taken from the ringing battery, through suitable resistance coils for this purpose.

It will work in either a vertical or horizontal position, which permits it being hung on a wall or mounted on a cabinet. Another excellent feature is that it is practically noiseless. There are others which are described in our free booklet. Let us send it to you.

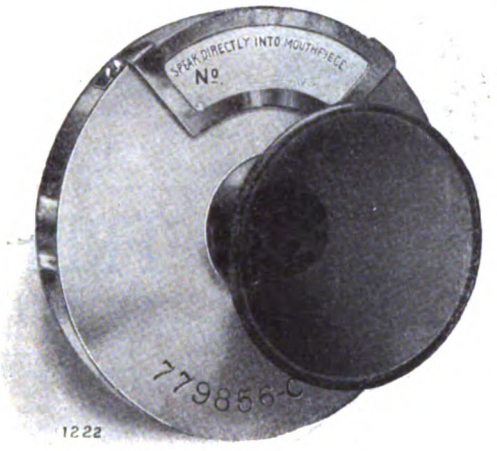
The Stromberg-Carlson Transmitter

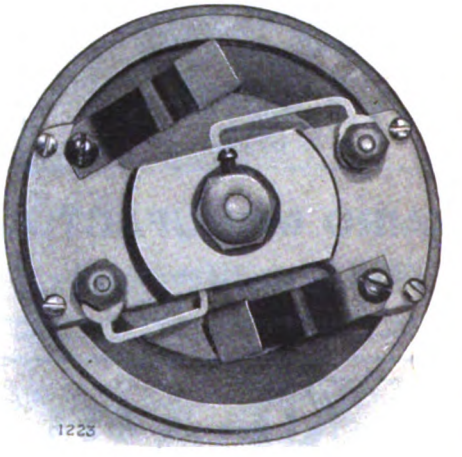


FRONT VIEW Showing Card Holder

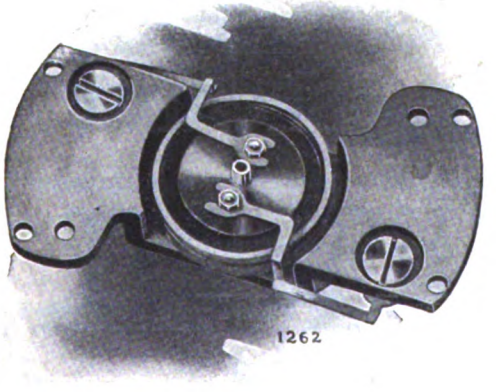
is decidedly different from any other you have ever seen. If you were to try it on a long distance line, then you would notice the difference---that counts.

THE ELECTRODES

are made of carbon, and both are attached to the central point of the main diaphragm. There is thus produced a variation in the distance between the electrodes of twice the amplitude of variation of the central point of the main diaphragm. It is unnecessary to claim a greater volume of transmission than if only one electrode moved.



TRANSMITTER With Back Removed



BRIDGE WITH CARBON CUP Showing Conductor Attached to Each Electrode

We give the transmitter such an adjustment that under ordinary tones of voice the volume is not as loud as some of the forms of sensitive transmitters now on the market. As the voice is raised, however, the volume of transmission from the instrument is multiplied two-fold so that the transmission, when talking in a loud tone of voice, has much more volume than that of any other type. The advantage of this is readily seen.

Let us send you new booklet describing and illustrating this transmitter. It tells the whole story, we mail it free.

Just ask for Booklet No. 91-B.

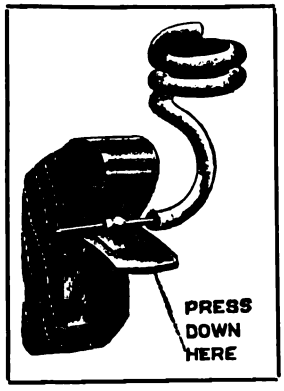
OFF WITH THE OLD AND ON WITH THE NEW.

Because you have always used the old style screw binding post, is no argument against the new style FAHNESTOCK SPRING BINDING POST. This is a device which is as superior to the regular screw type as a Waltham watch is to an hour glass. It eliminates all troubles due to loose or faulty contacts and is in a great measure the most important terminal improvement ever made.



Simply press down on the spring ear and insert the wire in the eye, then let go, and the wire is making a better, surer contact than can be secured by any other means. It can't cut, because the design of the holding surfaces and the tension of the spring is just right. It can't work loose, because the clip holds it almost immovable, and it cannot corrode, because it is open to air circulation except at the point of contact. Wires cutting, working loose, and becoming corroded have always been a large source of trouble and expense. Why tolerate these troubles when the Fahnestock post eliminates them? When so ordered, all batteries will be equipped with them FREE OF COST. If you like, we'll send you a sample to show you how it is done.

FAHNESTOCK ELECTRIC CO., 132 Havemeyer St. BROOKLYN, N. Y.

Barber's Business Increased by Telephone

By Edward A. Tyler.

SEATED at a table in the dining room of the Antler Hotel in Pittsburg last March R. P. Rathbone, the leading barber of Paterson, N. J., audibly expressed his regret at not having sent an important telephone message before ordering his meal. The waiter, who overheard the remark, greatly astonished Mr. Rathbone when he told him not to worry, as he would bring him a telephone. After an absence of a moment or so the waiter appeared carrying a portable desk stand on a polished metal salver. Attached to the instrument was a connecting cord provided with a plug, and this was fitted into a jack in the adjacent wall. Thus, without any inconvenience or delay the important conversation was carried on from the table. It so happened that Mr. Rathbone was one of the most progressive tonsorial artists in the country and one who never let the matter of expense interfere with the adoption of any measures which would be serviceable to his customers. As he says himself "The idea struck me as being such a good one as to be worth adapting to my business. I have among my customers a number of the most important business men in our city. For their convenience I had a pay station installed so that they could be reached by telephone in the event of anything of importance taking place or if required for any reason at all while they were in my shop. This was much appreciated, yet it had its drawbacks, as a man might be compelled to leave the chair in the midst of shaving." Immediately upon his return to Paterson about three weeks later Mr. Rathbone got in communication with the telephone officials. At first they did not consider the plan feasible, but the barber was confident, and after some delays the system was installed.

A Patron of a Barber Shop Equipped with Telephone Connections for the Chairs May Receive Calls Transferred from His Office and Be Thoroughly in Touch with His Affairs While Being Shaved.

The shop in question is the busiest in the city, eight barbers being employed continuously. As a call is liable to be received for a man in any of the chairs, a flexible system is essential, and the plan followed in the restaurant was adopted with no change in the method of operation. On receipt of a call a uniformed boy who is kept in attendance carries a portable telephone to the patron with whom conversation is desired. The plug attached to the connecting cord is then inserted in a jack located in the base board below the shelf in front of the chairs. As there are four of these jacks, wired in multiple, one being located between each two chairs, it is easy to reach the line from any of the eight positions. From these jacks the line is carried to a controlling key, to which is wired a holding coil, at the cashier's desk. From this station two lines run to the telephone exchange, and two desk stands are provided. One is on the same wire with the jacks for chair service, the other is in multiple with the instrument in the pay station booth. These two telephones are used to receive incoming calls by a person in attendance, who sees that connection to the person desired is completed. If the chair service is in use a party can still call or be called up over the line to the booth instrument.

The controlling switch is mounted on a table behind the cigar counter. On a lower shelf is the ringer box, which also contains the induction coil for the chair circuit. From it three wires are run to the different jacks, thus greatly simplifying the wiring connections and eliminating all unnecessary parts. This is an important feature, as on account of the volume of business done it would frequently be very inconvenient to stop shaving or haircutting operations while inspectors were trying to locate a coil or condenser trouble at the jack terminations. The wiring is all run concealed, and in its installation every precaution was taken to prevent the woodwork being damaged. It may be interesting to note that the booth is furnished in mahogany to match the interior surroundings.

From a business standpoint the telephone installation has been a great success. As a general average 16 incoming calls are received daily for patrons who are in the chairs, although on some

Digitized by Google

days the number is nearly doubled. As can be readily understood very few calls are originated over the chair circuit. Patrons who wish to talk from the shop use the booth. There have been occasions, however, when a man who has been well lathered has suddenly remembered some important business, and the opportunity to make a call under these conditions has been greatly appreciated.

An illustration of the value of this unique installation may be of interest. About two weeks ago H. M. Kirsenger, a prominent piano dealer in Paterson, came to Mr. Rathbone's to be shaved. Before he left his place of business he instructed his assistants that if any one called him he should be requested to call 709 or 710 (Mr. Rathbone's numbers) as he was going to be shaved. The barber in attendance had just applied the lather when a call was received. Without any preliminary delay Mr. Kirsenger was handed the portable desk set, and before he had replaced the receiver on the hook he had closed the sale of a piano which he had been endeavoring to dispose of for some time. Other instances of a similar nature have frequently happened, and now nearly all the business men within quite a large radius from Rathbone's place patronize him because of the convenience afforded by the telephone.

At the time the system was installed it was the only one in existence in a similar location. Mr. Rathbone has since received a large number of inquiries about it from all parts of the country, even as far as Los Angeles, Cal.; people from Chicago and St. Louis visiting New York have journeyed to Paterson to see if the newspaper reports they had read were correct. It will therefore be apparent that shops similarly equipped could largely increase their business, as public interest is genuine and the convenience of the arrangement widely appreciated. The expense attached to such an installation would be a small matter when the number of new patrons that could be secured are considered. That it is a paying proposition may be learned from almost any business man in Paterson.

The ability to obtain a belated shave in a shop in the business center of the town without getting out of touch with headquarters is a most valuable convenience to business men, and especially to physicians and others who are likely to receive a message at any moment.

Telephone Exchange Engineering

By Ray H. Manson, Albion D. T. Libby and Chas. A. Simpson.

ARTICLE XXIV.—THE MULTIPLE SWITCHBOARD SECTION.

THE telephone switchboard itself is made up of units called sections, as shown in Figs. 110 and 111. This enables one to furnish only as much apparatus as may be necessary at a given time. The number of sections will be determined by the present number of subscribers' lines and the number of these lines to be handled at each operator's position. The sections, which are usually arranged for three operator's positions, when joined together, appear as one continuous piece of cabinet framework.

The woodwork is generally made of mahogany or quarter sawed oak, mostly the former, as is the case of the sections now under consideration. The exposed woodwork of the entire section is solid mahogany, with the exception of the roof boards, which are oak and the rear doors, which are a good grade of poplar, stained mahogany.

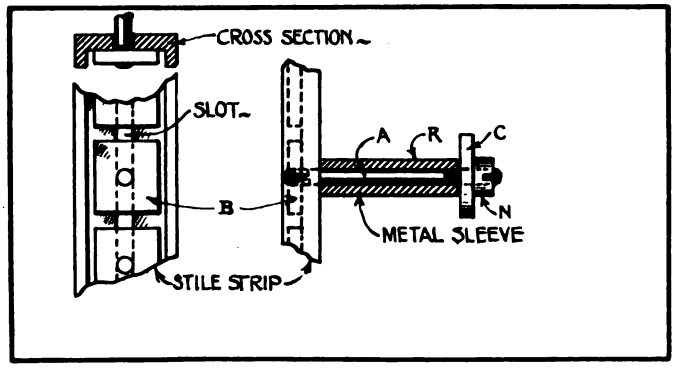

Fig. 108. Jack fastener and method of attaching it to stile strips.

The sections are designed so that easy access can be had to all parts. The entire rear of each section is exposed by the removal of three doors. Anything that is not exposed by the removal of the three rear doors may be exposed by the removal of the three panels just beneath the keyshelf in front, or by opening the keyshelves themselves.

The plugshelf runs the entire length of the section and is covered by one-eighth inch belt leather to within three-eighths of an inch of the keyshelf. This is drilled for the plugs and supervisory lamps. It is also common practice to place the latter in the hinged key shelves, so as to be more easy of access.

The keyshelf is divided into three parts in each section, the dividing line being between each two operators. They are made up in five layers glued together with the grain in the alternate layers at right angles and the grain of the top and bottom layer being parallel with the face of the section. This is done to prevent warping.

The rear and front doors are paneled to prevent warping. On the rear of the legs is fastened a maple board or "connecting rack," to which are fastened all the metal punchings, which serve to splice any "local" wire or wire within the section with any outside wire. Just below this connecting rack is located the "running box." This is a run way of oak for all cables except those attached to the multiple jacks. This running box has a removable top, made in the form of short trap doors, having flush rings for lifting them. On the floor of this running box cleats are fastened which extend about eight inches inside the legs of the section. These cleats are about three-quarters of an inch square and are used to keep the cables off the true floor, so that scrub water may not accidentally come in contact with them, and so that air may have a free circulation and thus keep them thoroughly dry. Some engineers prefer to have the strips 3 inches above the floor or higher, to protect the cables from flooding in case of fire.

Inside of the legs, just in front of the connecting rack and extending from the top of the legs to the floor, removable boards are located for protecting the punchings on the connecting rack from being hit by the cord weights. This is not absolutely necessary and in most cases is omitted.

Structural steel is used throughout for the frame of the sections. The legs at each end are made of inch and a half by one-quarter inch angle iron, which is thoroughly braced by gusset plates at the corners and by angle irons extending from one leg to the other. On the top of the legs is fastened a three-inch channel iron HS, Fig. 110, to which are fastened the keyshelf brackets BS and the jack stiles JS. This channel iron supports the weight of all the answering and multiple jacks.

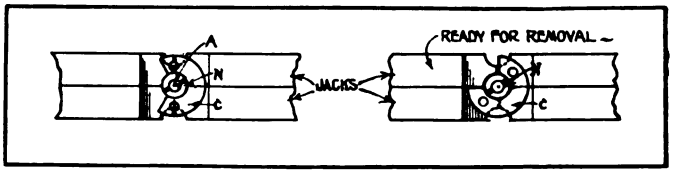

Fig. 109. Jack fastener holding ends of four strips of jacks. At the left the fastener is in position to retain all strips. To remove one strip it is rotated to the position shown at the right.

The stile strips are small channel irons which are slotted in the

Digitized by Google

middle from the top of the 3-inch horizontal channel iron HS to the woodwork or frieze at the top of the multiple jack space. These stile strips divide the sections into six panels. They are slotted in order that the jack fasteners A, Fig. 108, may readily be adjusted to the required height. These jack fasteners are made of a piece of brass rod ⅛ inch in diameter and threaded at both ends, one end being screwed into the adjustable guide B. On the other end of this rod is a nut N and a special washer, while over the intervening portion is the sleeve R. Each jack fastener holds the ends of four strips of jacks, as shown in Figs. 108 and 109. The washer C, when once arranged, is held in place by the nut N. This washer has one-fourth of its area from the outside to the edge of the nut cut away, thereby enabling a jack strip to be removed from its place for inspection or repairs. This can be readily done by loosening the nut N and turning the washer C around on the jack fastener, as shown in Fig. 109, until that part of the washer which is cut away is opposite the desired jack, which may then be easily removed. The washer will still hold the ends of the three remaining strips of jacks.

At both ends of a switchboard section is fastened a 1½-inch by ⅜-inch bar iron upright SU, Fig. 110, which extends to the roof boards. On the top of these uprights is fastened a 1½-inch angle iron, SA, and to this angle iron the multiple jack cable hangers SC are fastened.

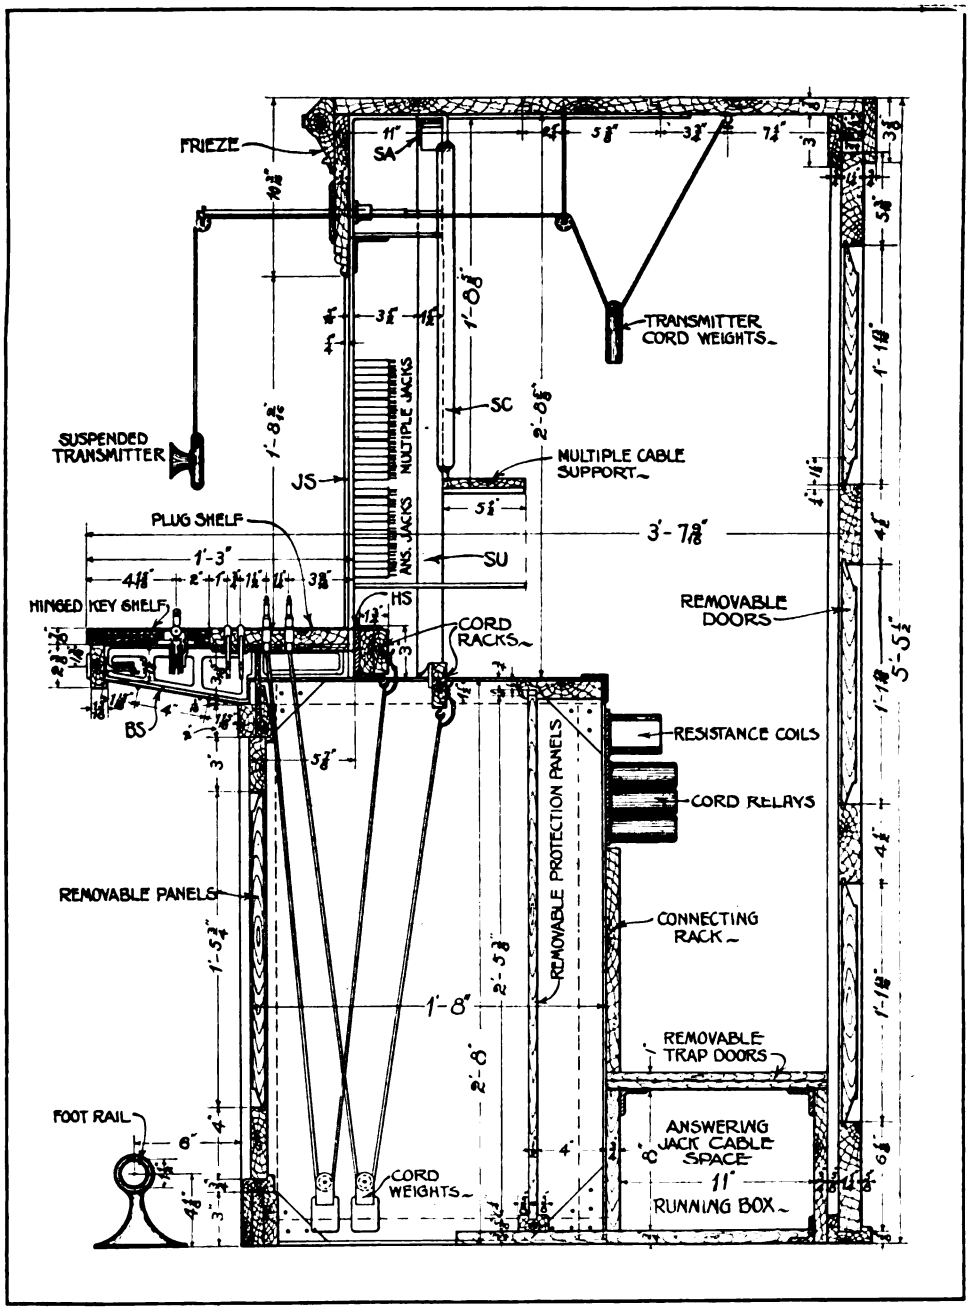

Fig. 110. Cross section assembly view of the "Example exchange" common battery multiple switchboard, showing method of attaching wooden cabinet work and apparatus to the framework.

A brass pipe foot-rest 1½ inches in diameter is supported from the floor by brackets, each section being so provided. The joint between sections occurs in the centre of one of the brackets, thus giving the foot-rest the appearance of a continuous pipe.

The cut-in jacks for the operator's receiver plug are located in the front rail of the keyshelf and on the extreme left of each operator's position. Two of these cut-in jacks are provided, one for the regular operator and the other for a student's use in learning.

The transmitter is suspended by a support or arm located in the frieze board in the center of each operator's position. The arm can be adjusted horizontally in the direction of its length. On the end of the arm are two pulleys over which the transmitter cords are run, and with the counter cord weights in the rear of the section the operator is enabled to adjust her transmitter at will to any desired height.

Breast plate transmitters (shown in Fig. 31, AMERICAN TELEPHONE JOURNAL, issue of Jan. 9, 1904), are now used to a great extent instead of the suspended type, and when properly designed give greater freedom in operating and more uniform transmission.

In cases where this type of transmitter is used, it is attached to a cord, which may be plugged into a cut-in jack in a manner similar to the receiver. This arangement permits the operator to be always close to her transmitter, even if she has to lean to one side to reach a distant multiple. It also makes it possible for each operator to have a transmatter of her own, which she always carries, even when she goes to another position on the switchboard.

In Fig. 110 it will be observed that there are two separate wooden strips for cord terminals, and that the lugs which are attached to wires for the front cord are mounted upon the board or rack nearer to the operator. In this way there is no chance for confusion of cord terminals, and the cords may be removed and replaced in the shortest possible time. In order to prevent a strain being put on the cord, which would tend to drag the conductor away from its fastening, a loop is provided near the rear end of the cord. This loop, when the cord is in position on the switchboard, is passed over a hook, as shown in the drawing. This arrangement causes the strain to be supported by the outer covering, in which a slight tension can do no damage.

In arranging for the plugs a hole is drilled all the way through the plug rail of the switchboard. Beneath this hole is mounted a metal seat, with a leather washer between the seat and the wood of the plug shelf. When the plug is idle its base

Digitized by Google

rests upon the leather, which in turn is supported by the metal seat fastened to the lower part of the shelf.

The front view of the section shows the arrangement of the paneling on the wood work, and all the various apparatus which is visible. The lower panels are provided with catches, which release when the handles are pulled forward to a horizontal position, and the doors may be readily removed. The removal of these doors gives access to all the cords; and on the removal of the second panel, as shown in Fig. 110, the wiring of relays, resistance coils, etc., may be examined. As the cords are gradually shortened as they are repaired from time to time, it is considered desirable to install them of so great a length that if left slack they would more than reach to the floor. In order to take up the excess in length it is customary to either knot the cords in some approved fashion, or to use a small holder, not shown, which is provided with a slot at each end of a short cylindrical barrel. The upper end of the cord is passed through one slot, then four or five spiral turns are taken around the barrel, and the cord taken out through the lower slot. This arrangement holds it securely, without causing undue stress to be placed upon the cord at the point of bending. By this arrangement a long cord may be used, and frequent renewals avoided.

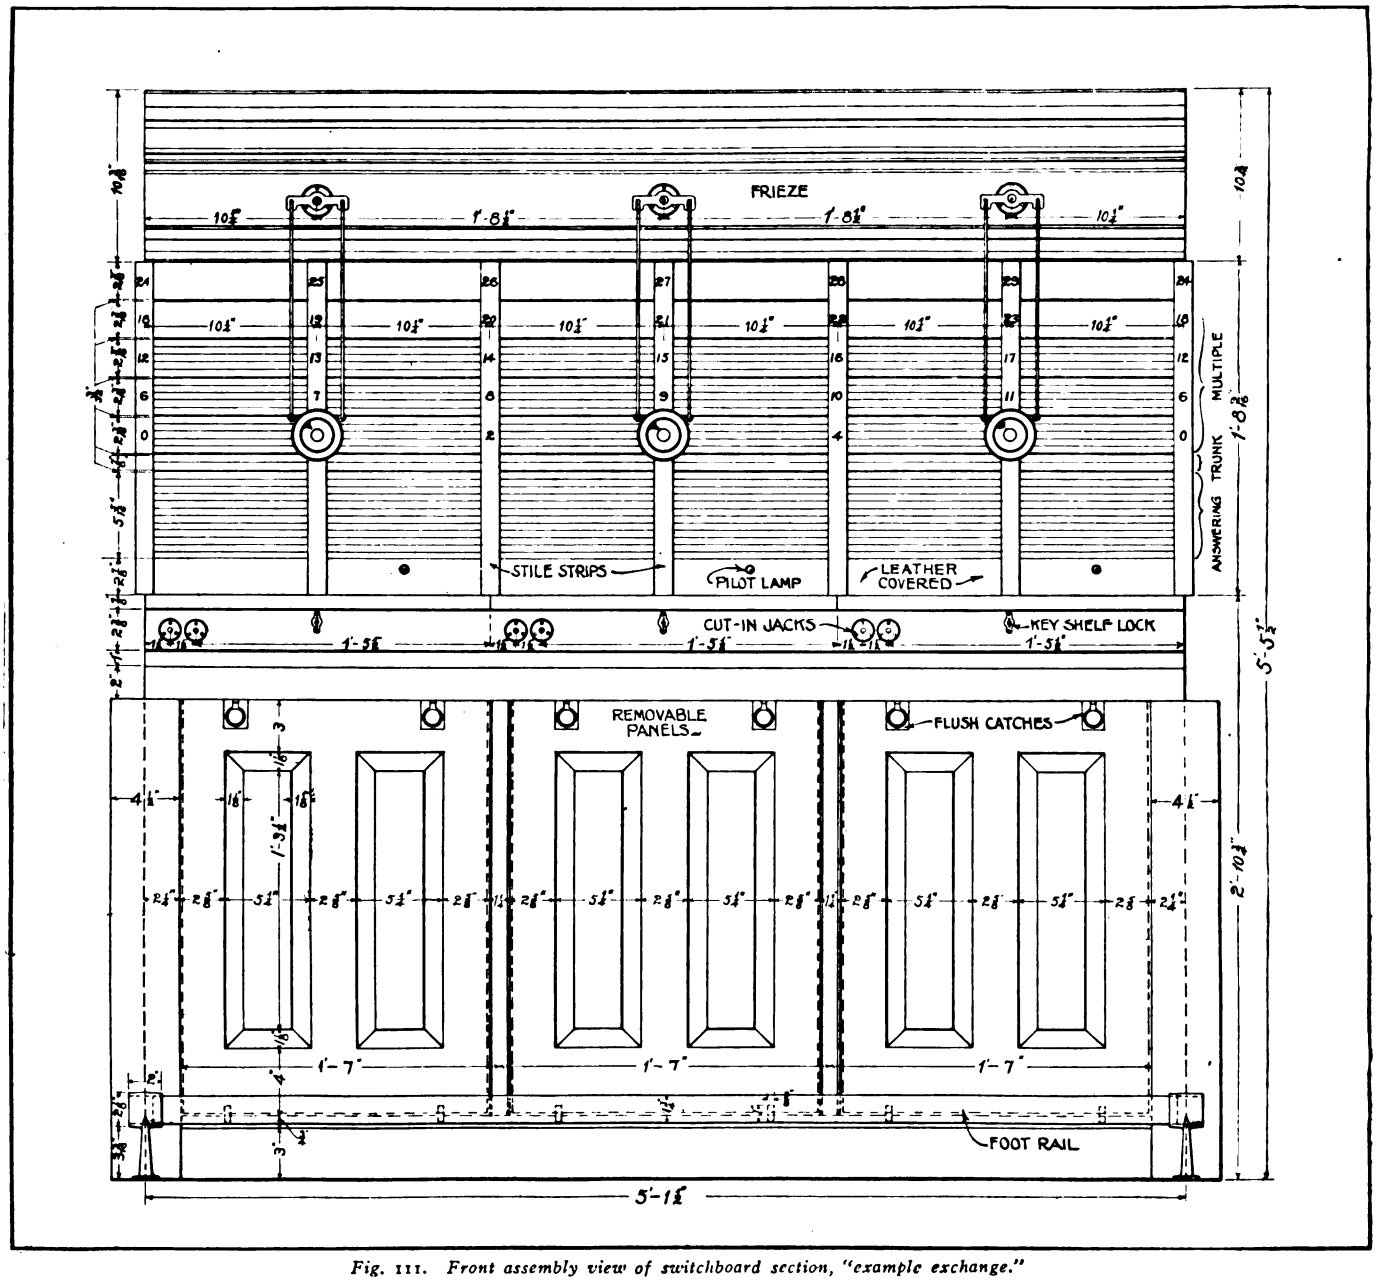

Fig. 111. Front assembly view of switchboard section, "example exchange."

Telephone Revenues

By W. P. Hemphill.

THE evolution of the telephone has been so rapid that few have been able to keep pace with it. If you should ask an experienced telephone man the most important feature of the business he would tell you that it was the subject of rates. If you should ask him what phase of the business contributed most to its success he would certainly tell you that it was the efficiency of the service.

Generally speaking, "Telephone Revenues" can be derived from only two sources, namely "Rentals," either on flat or measured service, and long distance tolls. A uniform rate to be charged by the various companies is out of the question, owing to the different conditions surrounding each station. Rates must be based on local surroundings. The reasons why service cannot be fur-

Address delivered before the annual convention of the Kansas Independent Telephone Association at Wichita, January 22, 1906.

Digitized by Google

nished uniformly to large and small cities are many. The population of the district to be supplied with service must be considered; also the form of construction necessary, and the ultimate capacity of the plant, as well as many other questions which enter into the cost of operation of an exchange, and upon which a reasonable interest on the capital invested must be met.

The question of determining what should be considered an equitable rate, from the point of a given investment, is a proposition too indefinite to consider, but as the rates of every company represented by this association have already been determined a discussion of this phase of my subject is entirely unnecessary.

What interests us chiefly now is the question of methods of getting that which we are entitled to receive under the franchise, and ways of increasing the gross earnings without a corresponding increase in the operating account. In the first place, the selection of the subscriber is of great importance. It is upon him that you must rely for the major part of your income. His paying qualities should be well considered, the permanency of his location should be ascertained, the probable cost of getting a line to him and likewise its future maintenance. He should first be taught that the punctual payment of his account is an important obligation and that it is very much preferred that he pay it by sending a check, or by coming to the office in person. Considerable saving can be made even by a small company by insisting on the policy of subscribers paying their dues at the office. This custom allows a closer friendship to exist between the management and the subscriber and saves the expenses of collection. At Topeka we have adopted very stringent rules regarding payments and expect to continue to insist on their being observed. When subscribers become delinquent they should be notified at once, either by a statement or preferably by the bookkeeper calling them over the telephone. If they are able to give good reasons for their inability to meet their account it should be carefully noted; otherwise an urgent demand should be made for a prompt settlement. We accept the theory that a company can lose nothing from the enforcement of a very rigid policy covering the collection of accounts.

There is a growing tendency in the minds of a great many people to shirk them, on the theory that any franchise-holding company is reaping an abundance from the profits of its business. The chief duty of the telephone company is to furnish the best possible service; the subscriber's duty to the company is to pay his bills promptly and treat its employes, especially the operators, with consideration. Any telephone company makes its reputation largely as a result of the enforcement of these principles. The subscriber is a partner in your business. It is with him that you have to deal. Thus it will be seen how important a matter should be the choosing of this person.

Rentals should be paid in advance and any part unearned refunded if for sufficient reasons the patron cannot keep the service for the period paid. No installation should be accepted short of one year, for as a general rule, it cannot be handled with profit for a shorter period. The public generally has confused the idea of cheapness with the cost of telephone service. To it, an instrument connected with some wire attached to the nearest telephone pole constitutes the greatest cost of furnishing service. It has no conception of how these calls get to the central office, the method of giving connections, or the intricate and costly mechanism necessary to handle its business and the labor necessary to keep it in operation. It sees only the instrument on the wall and the wire connecting it to the pole line. It is a frequent occurrence for some prospective subscriber to say that his order was given some days ago and that you must be derelict in your business. When you attempt to explain the reason why the instrument has not been installed he generally paralyzes you with the absurd statement that: "The company has poles and wires in his alley and the only thing left to be done is the placing of the instrument." The general public little understands what a telephone exchange is, and the tremendous cost of equipping and maintaining it. This is a great reason why subscribers should understand in the beginning that punctual payment is the essence of his contract. Non-payment without a reasonable excuse should mean a prompt forfeiture of the service.

As to the revenues derived from toll-line service. The local exchange and the local toll-line company mutually link together. The exchange must have the toll-lines to provide its subscribers with long distance connections; it is equally essential for the toll-line company to have the exchange to supply its business. In the division of revenue between them, the idea of this common interest should prevail. In my mind there is no question but the equitable basis for arriving at a just division should be estimated on the amount of business originated by the exchange rather than on the basis of incoming and outgoing messages, for the reason that the greatest expense to the exchange in handling toll messages comes from the necessity of making collections and accounting. Toll-lines will never be any considerable source of profit to the average exchange company. The exchange must depend indirectly upon the prestige the toll lines afford as its source of profit.

Few Independent companies in the beginning were aware that to maintain a system it would cost more per telephone to operate, say, one thousand lines than five hundred lines, but they have since discovered when figuring operating expenses and after setting aside a safe amount to cover depreciation, that there is nothing left. Let us consider briefly, some ways of increasing revenues without a corresponding increase in the investment and operating accounts. Telephone service should be graded to suit the peculiar needs of the people. We can find relief in the use of party lines which place the rates within the easy reach of a greater number of people. The rapidly increasing use of the telephone has made a demand for its service upon every class of business. The exchange should be in a position to supply all with telephone service without working a financial burden to any.

As an illustration of how this may be done I want to cite the situation at Topeka. Our single business line rate is $36 per year, while that of the single residence line is $30. We also furnish a rate of $2.50 per month by allowing two business houses whose location is in close proximity to be put on the same line, thus paying us $60 per year for practically the same investment as the single line for which we charge $36.

In the residence district we put four subscribers in the same block on one line and charge each subscriber an annual rental of $18, thus getting a gross income of $72 per line per annum. Our party lines are made up in blocks so that the line and pole construction is no greater than that of the individual lines and from which with the additional investment of three instruments and the labor of installing them we receive an additional revenue per line of $3.50 per month, or $42 per annum. For five hundred individual residence lines we would receive an annual income of $15,000, while for the same number of four-party lines we would receive $36,000 per annum, or a difference in gross income of $21,000 in favor of the party lines. The additional investment for installation does not exceed $2,000, so that this difference in income (which is $21,000), would need to pay a reasonable interest on the $15,000 additional investment, which at best could not be over ten per cent., or $1,500. This still leaves a balance of $19,500 to the good of the party line service. But the additional 1,500 telephones which have not added a dollar to the investment in switchboard, toll line, and cable equipment, have added additional burden on the operating forces over what the number of individual lines would be.

Yet, on our basis, we still have a possible balance of $19,500 on a given number of 500 lines to liquidate all charges from the operating, maintenance and accounting departments. We feel that our party line service fills every requirement of the average residence. Many of our most influential people, who are amply able to pay for any class of service desired, prefer to remain on a party line rather than pay the additional rate of $1 per month. In this class I can include a large majority of the bankers of our city, every minister (with one exception), many of Topeka's noted lawyers, and scores of our best business men. We have, I think, demonstrated with satisfaction that party lines under the enforcement of rigid rules as to time limit for conversation and general courteous treatment among the subscribers can be made a cheap and practical means of supplying service, and the principal source of profit to the investor.

Digitized by Google

Party lines are not the only means of increasing the revenues per line without a corresponding increase in the investment. An extension telephone at a rate of from 50 to 75 cents per month is an excellent and profitable investment to any exchange. The solicitor should be instructed to work this line of business, the value of which can readily be shown to the business man in saving time and many unnecessary steps. It allows him to answer calls promptly and many times permits him to dispense with business matters in less time than it would take him to reach the main telephone. Certainly no part of the business can show better profits than the rental of extension telephones at the customary rates. They can be made to overcome losses from unprofitable rates elsewhere.

Private branch exchanges for the large business institutions and pay stations for the use of the general public in the larger cities are also "revenue providers." I believe many of the smaller exchanges would find that public pay stations at convenient places for local and long distance service would add materially to their collections.

I want to say here a few words about "deadheads." Every exchange has this disagreeable business to a greater or less extent, and the tendency is ever to increase and never to diminish. The policy of donating service to favored classes and in lieu of special favors is a bad one and should be discouraged. There are few advantages to be gained and many disadvantages to overcome. Telephone service should be treated as any commodity. It should be purchased and paid for at its true value. There is no more reason why a telephone company should purchase its prestige through the means of "deadheading" than there is for a dry goods merchant or groceryman to give his goods away in order to court public favor. Success rests upon good service; it is the only means whereby substantial and lasting business can be built up; without it no amount of "deadheading" can perpetuate it and with it none is necessary. The subject of "deadheads" calls to mind the custom of "free service" between local exchanges. This policy injures the whole line in business and discourages investment along this line. Expediency may seem to justify this interchange of business in order to strengthen the exchange, but the sound wisdom of such a course is nevertheless questionable. The good effects resulting from these combinations are only temporary and are soon lost sight of. The connecting lines are always overtaxed with useless calls so that legitimate business must be sidetracked. This condition is unsatisfactory to the greatest interests which are the main support of all exchanges. A reasonable charge can be easily maintained between local points, and should be for the good of the service as well as the financial benefits accruing.

Football Game Followed by Telephone Reports

By A. E. McKee.

A FOOTBALL game which was played in Ohio last fall was followed by many hundred distant persons through the use of reports transmitted by telephone.

The cities of Massillon and Canton each boasted of a great football eleven. The Massillon Tigers had won hard-earned honors and the All Star team from Canton had been lifting celebrated scalps in a most interesting manner. A game for Ohio honors was finally arranged and was to be played at Canton. About $60,000 was wagered on the outcome of the game and the great match was the all-absorbing subject of conversation and speculation in both cities. Every citizen of Canton was interested in it and the same was true of Massillon.

A request was made that the telephone company arrange some plan for not only giving results, but the detailed plays as they were made. The matter was taken up by A. S. Hillhouse, general manager of the Stark County Telephone Company, who worked in conjunction with Manager M. C. Sammons at Massillon under the general direction of C. Y. McVey, general manager of the United States Telephone Company. They decided to give the people a thorough demonstration of up-to-date emergency telephone service.

A booth was rigged up on the gridiron at Canton, and connected with the long distance lines of the United States Telephone Company leading to Massillon and with the wires of the Stark County exchange at Canton. Two expert football players watched the game from a platform and with glasses called the plays to the long distance operators in the booth, who at once repeated them to the telephone operators.

At the Massillon exchange there were fifteen operators with through lines all connected with the residence and business telephones of the city.

In the Canton office there were thirty-six operators who had made connection with all subscribers who wanted the news, and they repeated the plays as they came from the field. The people of Canton who were not at the game were able to hear every play and they knew each result before the succeeding play was made and they knew the name of each player who made the star plays. There was less than thirty seconds intervening between the time a play was made and the news received by the people sitting in their homes or offices all over the city of Canton. They knew the final result before the first yell of victory had died away, and that yell was re-echoed from the homes of enthusiastic listeners all over the city.

It was the most up-to-date and modern example of special telephone service the people of either city had ever heard of, and it resulted in an immensely increased popularity for both exchanges in their respective cities.

ANNUAL REPORT OF PRESIDENT DICKSON SHOWS EXTENSIVE IMPROVEMENTS MADE BY CUYAHOGA COMPANY.

THE annual report of President F. S. Dickson to the Cuyahoga stockholders showed that during the past year there had been expended in the development of the plant the sum of $719,502.14. With that expenditure there have been added 6,070 telephones to the list in service, added six sections to the central switchboard, increased the branch exchange switchboards by 39, with an increase in revenue from $27,103 to $42,212, and the intercommunicating office system by 16. The switchboards in the Shore, Chagrin Falls, Independence and Mayfield exchanges were also enlarged. There were strung during the year 12,461 miles of copper wire, cable capacity was increased 1,350 pairs, the cable underground was increased 90,379 lineal feet, while 130,135 lineal feet of aerial cable was put in place. During the past year the exchanges at Collinwood and Chagrin Falls have been bought.

The company rewrote 3,209 of the old contracts under the new rates and is busily rewriting the others as they expire. The new contracts gave a monthly average of 505 2-3 for the year. The number of pay stations has been increased from 493 to 725, the income from that source being increased $13,627.41, which is about 60 per cent. In the part of the report relating to service it is established that the average time for the exchange to answer a call is four seconds; it takes six seconds more to complete the connection and ring, and the subscriber called consumes fourteen seconds in getting ready to answer, 88 1-2 per cent. secure an answer on the first call. In ten per cent. of the calls the line is noted as "busy," 1.3 per cent. fail to answer the bell and in two-tenths of one per cent. some line trouble interferes. As thirty-seven people every day leave their receivers off the hook, a portion

Digitized by Google

of the "busy" trouble is accounted for. On an average 2,050 people ask daily for the time of day, 136 wish to know the weather forecasts, 3,111 ask for football returns in season and 4,790 wish to know of baseball scores, while 37,839 subscribers asked for election returns in one day last November and got what they wanted, while nearly as many subscribers called up between 5 and 6 o 'clock on a single night to ask where the fire was. There are now 75 subscribers who ask daily to be wakened at a certain hour in the morning. From the careful counts taken periodically during 1905 the total number of calls cared for by this company reached the enormous number of 51,516,324.

The company plans the expenditure of about $600,000 for development work during the present year. This expenditure Mr. Dickson estimates will increase the earning capacity of the company about 25 per cent.

The treasurer's report, showing earnings and expenses in relation to the telephones in service, was given by Mr. Dickson as follows:

Per telephone.	1903.	1904.	1905.	Dec., '05.
Gross earnings	$33.57	$31.87	$30.45	$29.99
Expenses and taxes	17.70	17.06	16.86	15.60
Net earnings	15.87	14.81	13.59	14.39
Other income	.31	.10	.09	.11
Net income	16.18	14.91	13.68	14.50
Deductions	10.39	8.77	7.74	6.87
Surplus	5.79	6.14	5.94	7.63

This is an interesting table as the introduction of the party line system must decrease the average earning power per telephone, but as it tends also to decrease the expenses and to increase the surplus, this consideration is believed to justify the introduction of the party line. It will be noticed that the surplus shown during December, 1905, is the largest on the list.

The company has been increasing the number of its subscribers so rapidly that it has gained a considerable lead over the Bell company, which has been operating for many years and has made the most strenuous efforts to retain its grip on the situation. Regarding the actual figures, we quote from the report as follows:

"It is difficult to make accurate comparisons with our rival exchange as the Bell Company does not publish actual figures. It is well, however, to note that the November book of the Cuyahoga Company had 330 more names than the October book of the Bell Company. On July 1, 1905, Mr. Frederick DeBerard, secretary of the special telephone committee of the Merchants' Association of New York City, made an investigation of conditions in this city and reported that from a careful analysis of the books there were 16,342 subscribers to the Bell Company and 16,745 to the Independent telephone. This opinion by an unprejudiced investigator confirms the anticipation expressed in our last annual report that before the year was half gone the Cuyahoga Telephone Company would lead the Bell in the number of its patrons as it does now in the quality of its service. The gratifying result has been largely due to the energy, wisdom and efficiency of Mr. W. B. Woodbury, who has had charge of the contract department."

At the annual meeting of the stockholders all the old directors were re-elected save Chas. A. Otis, who declined to longer serve. B. Mahler was elected in his place. Frederick S. Dickson was re-elected president; Henry A. Everett, vice-president; Wm. L. Carey, Jr., secretary, and R. W. Judd, treasurer. Mr. Carey was elected secretary some months ago when James B. Hoge resigned to give his time to the National-Interstate Association.

JUSTICE HOLDS COURT BY TELEPHONE IN NEW YORK STATE.

SITTING in his chambers in Kingston, N. Y., Justice Betts held court in Albany through the medium of the long distance telephone. He had been presiding at the trial of the action brought by James F. O'Gorman to recover $5,000 from Armour & Co. for injuries alleged to have been sustained through the company's negligence.

The jury retired and Justice Betts started for Kingston ofter getting the consent of Justice Fitts to receive the verdict. The jury was out all night and in the morning asked for further instruction. Justice Fitts was not familiar with the case and Justice Betts was called up at Kingston.

Over the telephone he made clear the point in the evidence which the jury wanted explained. The attorneys on both sides argued over the telephone with Justice Betts. The jury reported later that it was unable to agree, and it was discharged by Justice Fitts. The proceeding was unique in the history of the courts.

TELEPHONE RATES IN RUSSIA AND MEXICO.

SOME recent statistics relative to the rates for telephone service in Russia and Mexico have been furnished by J. Sitzenstatten, and are printed herewith, for the benefit of our readers:

RUSSIA.

Moscow:	Banks, Railways and large public establishments	$53.22	U. S.
	Ordinary business houses	40.93	"
	Residences	36.83	"
	Auxiliary instrument within same property	15.54	"
Warsaw:	First class, as above	$46.47	U. S.
	Second class, as above	35.75	"
	Third class, as above	32.17	"
	Extension instruments within same property	15.54	"

These rates are all yearly and for strictly metallic, first class central energy service.

—

MEXICO.

Mexico City and Federal District:

Mexican Telephone & Telegraph Co. (Bell):

Within the city limits:		
Metallic circuit (Wall sets)	$62.52	U. S.
Metallic circuit (Desk set)	68.52	"
Extension instrument, same building, same line	15.00	"
Single grounded lines	43.80	"

The New Telephone Co. L. M. Ericsson & Co. (Independent).

(Only metallic circuits, within the whole District).

Business telephone	$50.00	U. S.
Private residences	37.50	"
Extension telephone, within same property per year, payable quarterly in advance	17.50	"

GERMAN EMPEROR HAS CONFERRED TITLE OF NOBILITY BY TELEPHONE.

IN an article in the February *World's Work* Mr. W. G. Fitzgerald says: "One of Herr von Bülow's principal achievements as State Secretary for Foreign Affairs was the conclusion of the affair with Spain regarding the groups of the Caroline, Pelew and Marianne Islands, which gave great satisfaction to the Emperor and resulted in the promotion of the Secretary to the rank of count. The promotion took place in a typically modern way. The news of the termination of the South Sea trouble was telephoned by the Secretary to a high officer of the imperial household at the palace in Potsdam, some sixteen miles away. Five minutes later the telephone in von Bülow's study rang, and the same officer said, 'I am ordered to inform Your Excellency that His Majesty confers upon you the title and dignity of a count of the German Empire!'"

THE EDITOR'S PAGE

AN EMERGENCY LIFE SAVER.

THE life of a prominent Philadelphia banker has been saved by the use of a properly located telephone. While lying in bed he was seized with a sudden and violent attack of ptomaine poisoning. The weakness brought on by the severe pain he endured was so great that he could not arouse the servants. A portable telephone beside his bed enabled him to call a physician, who brought him out of danger.

A case like this goes far to justify the statement that the expense for installing a telephone is even more justifiable than that for insurance. While insurance may almost afford compensation for some losses, the use of a telephone is a preventive measure. Instead of offering a money equivalent it preserves the thing itself. When a life is in danger, or even in cases where valued property is exposed to a hazard, the use of the telephone will summon assistance in the shortest possible time. Moreover, the services obtained by the telephone call are those of persons trained to meet the emergency. No time is lost through the inappropriate actions of excited or ignorant persons. The telephone enables the proper person to be selected, and he may immediately start for the point of action, prepared for the work he has to do. The telephone, then, not only enables aid to be obtained, but it reaches those capable of rendering skilful assistance, conveys the appeal quickly, and may prepare the person called to handle the difficulty in the most intelligent manner immediately on his arrival.

The obtaining of these results, however, demands something more than the presence of a telephone in the house. In the case we have mentioned as an illustration, it is possible that if the telephone had even been a wall instrument placed at the opposite side of the room the man would have died. The essential thing is accessibility. Unless the instrument can be reached with the utmost readiness its value is greatly diminished.

THE EXTENSION OF AMERICAN TELEPHONE PRACTICE.

A NOTEWORTHY event in the development of telephony is the installation of the new switchboard at London, in connection with the system of the British Post Office. This equipment is illustrated and described at some length in a recent issue of the *Electrical Review*, of London. As it is manufactured by an American company, and installed in accordance with American standards, the supremacy of the apparatus and methods of doing work which have been developed in this country seem to have received the strongest kind of indorsement.

In view of the well known spirit of conservatism which has hitherto hampered the British engineers in their development of the system, it is extremely interesting to note the modifications in the arrangements for handling traffic which have been introduced. The entire equipment is arranged in a manner which is conformant with the accepted methods in vogue on this side of the water. As not more than 20 per cent. of the calls coming to a given switchboard can be completed in the same office district, the subscribers' multiple in subscribers' sections has been omitted, all calls being completed through a trunk switchboard. This method of handling connections is another instance in which the Post Office engineers have adopted without change a system developed in our largest cities, where similar conditions prevail.

A most significant line of thought is opened up by this unqualified adoption of a foreign system. This was brought about only after a long and careful investigation by the persons in charge of the work had convinced them of the extremely high state of perfection to which telephone development has been carried in this country under the stimulus of a vigorous competition. For this reason it is a safe prediction that the present installation, which will be watched with the greatest interest by the foreign engineers, will only be the forerunner of many others which will follow the practical demonstration of merit in the present case.

During the visit of the foreign engineers to this country, at the time of the St. Louis exposition, the greatest interest was taken in the equipment and operating methods of our telephone companies. Since that time it is fair to presume that the information gained at that time has been supplemented by many additional facts, gained from sources opened for their investigation during the visit. The field of American telephone practice has been looked over with considerable care, not only by engineers in England, but also by telephone men in Germany, Austria, Sweden, Italy and France. In all of these cases there are indications that the methods learned have been considered worthy of adoption. Their duplication, however, would entail an enormous amount of work on the part of the foreign service. In many instances Government control operates to hamper initiative and lower the rate of progress to such an extent that the building up of complete plants for the manufacture of apparatus would be a very slow process. Moreover, where a complete change in methods is put in force it takes considerable time for those handling the work to form plans for progress in the art. This would tend to allow the lead gained in this country to still be maintained if a policy of imitation were to be determined upon. The field seems to be particularly open at the present time, and it is to be hoped that the result will be a widespread introduction into Europe of the methods which are now conceded to be superior.

AN ADVERTISING HINT.

THE Niagara Falls Light and Power Company is said to have recently put into practice a scheme for getting advertising copy which may convey a useful hint to telephone companies. The plan is used in connection with advertisements in local papers which are frequently changed. By the use of these advertisements the copy is always fresh and interesting, and, in the course of a year, reasons for the use of the company's service may be given which will reach in a striking manner almost every reader of the papers. The method of obtaining the copy for these advertisements is, however, the most unique feature. The company places the matter in the hands of its solicitors and uses the best idea which comes in each day. The result of this plan is that the advertisements may be made to cover the local situation very thoroughly and be worded in a manner that will appeal forcibly to individuals. It is generally recognized that the man outside has exceptional facilities for gauging the state of public opinion. The details of objections to the use of the commodity which he has to sell and the reason why he fails to interest people are familiar. The solicitor is likely to require some coaching in the best manner of stating reasons, but should be familiar with the arguments that bring results. The officials of the company in this case are endeavoring to put this knowledge to the fullest use. The plan is unique and interesting and seems to be well adapted for use by telephone companies. It is so likely to produce good results that it seems to be well worth a trial.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

HOUSE MOVING AND TELEPHONE WIRES IN TEXAS.

Can you give us any cases bearing on the rights of house moving along the streets in conflict with telephone wires in the State of Texas? Any information you can give will be appreciated. A. D. Co.

THE law as regards house moving in conflict with telephone wires in the State of Texas is substantially the same as it is in other States. It is generally held to be an unreasonable use of the street, and telephone companies have the right to be protected from interference. When the house mover has permission from the city to move a building, and there is no other way for it to be done except across the street occupied by the company's lines, telephone companies are obliged to move their wires and cables to let the building pass. If the person moving the building can use a side street or an alley just as well, he can be compelled to do so. The person moving the building can be required to pay all the expenses of moving and replacing wires and cables, and can be compelled to guarantee payment beforehand. A bond to pay all expenses and hold the company harmless may be required. If the house mover refuses to protect the company in this way, he may be enjoined from interfering with the company's rights. The theory upon which these rules rest is that the franchise of the company is a vested right in the streets that cannot be impaired by subsequent action of the city directly or indirectly annulling it for purposes not public. The use of a street for moving houses is an extraordinary use thereof, and while it may be permitted, it must not be permitted in such a way as to destroy the use of the streets for other public purposes. The law is well stated in N. W. Telep. Exch. Co. v. Anderson, 98 N. W. 706.

CONSEQUENCE OF ERROR IN DIRECTORY.

By mistake the name of one of our patrons was published in the directory as being engaged in the saloon business. He was, in fact, the proprietor of a meat market. He claims that the mistake has resulted in large damages and threatens to sue the company unless we make some kind of a settlement with him. What do you advise us to do? R. L.

THE saloon business is a perfectly lawful one and it would be necessary for your patron to prove that he had actually been damaged before he could recover anything from your company. In other words, he would have to show that customers of his were actually led to cease trading with him on account of the error, or that persons who contemplated trading with him were driven away. If he could not show either of these facts he would not be entitled to claim anything from the company. We would suggest that you investigate as well as you can the question of whether he can prove any such damages or not, and be governed by the result of the investigation.

INJURY FROM FALLING TELEPHONE POLE.

A CHILD eight years old, who was hurt by a falling pole of the Southern Bell Telephone and Telegraph Company, brought suit in Georgia by her next friend against the company for damages. It was alleged that her injury was sustained by reason of the negligence of the company's servants who were engaged in cutting down the pole which was upon the public highway, without the use of guy wires, ropes or props, and without having any person stationed near the pole to warn the public of impending danger. The company answered, admitting that it did not use guy wires, ropes or props, but averring that one of its servants was stationed near the pole to warn the public, and actually warned the plaintiff, but that she disregarded the warning. The little girl testified that she did not stop when warned, but thought she could get by before the pole fell. The jury brought in a verdict for the company and the plaintiff appealed. The question before the Supreme Court was whether the judge properly instructed the jury as to what would amount to due care on the part of a child eight years old. His instructions upon this point were approved and judgment confirmed. Stewart v. Southern Bell Telephone & Telegraph Co. (Ga.), 52 S. E. 331.

POSTAL CARD BILLS ARE DUNS UNDER POSTAL LAWS.

THE Indianapolis Telephone Company met an obstacle in the shape of the Federal postal law that interfered with its new plan of collecting accounts. Postal cards were sent quarterly in advance. The postal is supposed to be returned with check or cash, and it is so arranged that it can be cut in two and stamped "paid," one-half returned to the patron, the other half kept by the company. The plan was not well received and soon after the first bills were thus sent out the attention of the Federal authorities was called to the fact that the company was sending duns by postal card in apparent violation of the law.

WARRANT READ OVER TELEPHONE LINE.

AT Middlesboro, Ky., an arrest was made in which the telephone played an important part. A warrant was sent to the sheriff at Pineville for the arrest of one John Partin. The sheriff called Lieut. Wilburn of the Middlesboro military company by long distance telephone and told him to call Partin. When the latter answered the sheriff read a warrant for him charging him with the murder of a man at Corbin some time ago. Wilburn took Partin in charge and conveyed him to Williamsburg, where he was placed in jail.

PLACE OF CONTRACT MADE OVER TELEPHONE.

THE Sperry Flour Company, a California corporation, was sued in the Superior Court of Yolo County for money alleged to have been advanced it by the bank of Yolo. The company asked a change of the place of trial to San Francisco, where its principal place of business was located, on the ground that it had not been sued in the proper county. The question of where suit should have been brought depended upon where the contract, in accordance with which the money sued for was loaned, was to be performed. The cashier of the bank in Yolo County called up the agent of the defendant at Sacramento by telephone, and in effect offered to advance a sum of money to the purchaser of a lot of wheat if the defendant would agree to honor his draft for $1,400. The agent of the defendant answered by telephone that they would honor the draft. Relying upon this promise the bank advanced the money to the purchaser of the wheat and drew upon the defendant for the $1,400, which draft was duly honored. The court held that the contract was made in Sacramento County. This would have entitled the plaintiff to sue in Sacramento County had it not been that the contract was intended to be performed in Yolo County. It was, therefore, finally decided that the suit was brought in the proper county. Bank of Yolo v. Sperry Flour Co., 141 Cal. 314, 65 L. R. A. 90.

IN THE OPERATING FIELD

SOUTH DAKOTA COMPANY TO RAISE MONEY FOR EXTENSIONS.

AT the annual meeting of the Grant County Telephone Company the stockholders took up the consideration of a proposition to issue bonds to the amount of $30,000 for the purpose of extending the company's lines.

Since the organization of the company eight months ago 400 miles of lines have been built and over 400 telephones are in operation, with 150 more ordered to be installed at once. The company has in view the extension of the line from Corona, its present northern terminal, to Wilmot, Sisseton and Brown Valley. A line will be run immediately from Big Stone to Ortonville, where connections will be made with the Tri-State Telephone Company. The company is in Southshore, Coddington County, now and will probably extend to Watertown before long. Over $20,000 has been expended up to date. The money was secured by the sale of stock in $40 shares. It is all in the hands of farmers and local merchants, who are well satisfied with the rapid progress made by this enterprise.

AN ATTEMPT TO RELIEVE THE INDEPENDENT SITUATION IN OHIO.

AT a recent meeting of the city council of Toledo, O., a resolution was adopted, which requests the Lucas County representatives to the State Assembly to have passed a bill to authorize city councils to regulate telephone rates every seven years. The city solicitor has prepared such a bill and has sent it to Columbus for consideration at the hands of the State Legislature. The proposed law contains the following provisions: That the council of any city or village may be empowered to regulate, from time to time, the prices or rates which telephone companies may charge for service; that such prices or rates, so fixed, shall include rentals of telephones, instruments or other appliances; that companies incorporated to give telephone service shall be compelled to furnish such cities, solely for the use of such municipalities, in connection with a fire alarm exchange system, all other accessories necessary to complete public service, and the free use of not to exceed 25 telephones, and to keep such telephones in working order; that the company may, after six months from the adoption of the ordinance, file its written acceptance of the terms of the ordinance with the clerk of the council, and, if it does not do so, the council may change them as often as it desires; however, if the company accepts the terms, as laid down by the council, the terms are good for seven years, when the city body may again adjust the rates. The city solicitor is directed by the provisions of the bill to enforce the ordinance.

The proposed bill will affect all telephone companies throughout the State alike, and strong efforts will be put forth to secure its passage. If passed it will interfere with the vested rights of those companies holding the franchises and operating under them in the State.

NEW STATE TELEPHONE COMPANY OF IOWA TO ISSUE NEW CAPITAL TO PROVIDE FOR EXPANSION.

AN issue of $100,000 of stock was decided upon at a recent meeting of the board of directors of the New State Telephone Company held in Sioux City. This sum will be employed to extend the lines of the company. From northwestern Iowa, its original territory, it is now building extensions in Minnesota and Dakota, which, with the new lines, will give it a very efficient toll system.

Work on the improvements will begin at once. It is said they will include a trunk line to Council Bluffs and South Omaha, through lines to Sioux Falls, Yankton and Elk Point, a line to Worthington, Minnesota, to connect with the Tri-State company's line from Minneapolis, and an extension from Randolph to Lincoln, Nebraska. The latter extension will not be completed until next summer. The lines to Elk Point, Yankton, and Sioux Falls are practically completed now, and will be turned over to the operating department next week. The line to Council Bluffs is completed as far as Blencoe, Ia. The Worthington extension will be made north from LeMars.

These extensions will add about 500 miles to the company's system, which has at present about 1,000 miles of lines in service. The connection with the Tri-State company at Worthington will put the exchanges of the New State company, including that at Sioux City, into communication with 12,000 miles of copper wire toll lines in Minnesota and North Dakota, extending as far west as Grand Forks, North Dakota, and north to Duluth, Minnesota. The Council Bluffs line will connect with independent toll lines as far south as Kansas City and St. Joseph, having a mileage of many thousands.

The following directors were elected for the coming year: Charles G. Cockerill, Jefferson, Iowa; M. M. Head, Jefferson, Iowa; Ira Conger, Cherokee, Iowa; Joseph Mattes, Odebolt, Iowa; W. H. Leathers, Mapleton, Iowa; Fred Marquis, Onawa, Iowa; C. H. Smith, Sioux City, Iowa.

The following officers were elected: Charles G. Cockerill, president; W. H. Leathers, vice-president; Joseph Mattes, second vice-president; M. M. Head, treasurer; C. H. Smith, secretary.

THE CONSOLIDATED COMPANIES OF PENNSYLVANIA TO INSTALL SEVERAL LARGE EXCHANGES.

AT the annual meeting at Allentown the Consolidated Telephone Companies of Pennsylvania elected these directors: Robt. E. Wright, Wilson J. Hartzell, Geo. O. Albright, Thos. Daugherty, Allentown; Isaac Heister, A. J. Brumbach, Reading; Frank M. Green, Washington, D. C.; J. P. Helfenstein, Shamokin; George R. Bedford, W. H. Lathrop, George N. Reichard, I. A. Stearns, Wilkesbarre; C. W. Kline, Alvan Markle, Hazleton; C. D. Simpson, Scranton; A. P. Trautwein, Carbondale. The directors elected these officers: President, Robert E. Wright; vice-president, C. W. Kline; secretary and treasurer, C. M. W. Keck; general superintendent, Charles West. The company owns the Independent systems at Scranton, Carbondale, Wilkes-Barre, Hazleton, Slatington, Lehighton, Mauch Chunk, Allentown, Reading, and many other smaller towns in Eastern Pennsylvania. No dividend was declared, in view of the fact that the board has contracted for new exchanges at Allentown, Hazleton and Emaus, at an expense of $160,000.

MARYLAND TELEPHONE AND TELEGRAPH COMPANY ELECTS NEW OFFICERS.

AT a recent meeting of the directors of the Maryland Telephone Company Mr. H. W. Webb resigned as president and Mr. David E. Evans, vice-president, was elected to fill the vacancy. Mr. Benage S. Josselyn was chosen vice-president to succeed Mr. Evans. In addition to resigning the presidency, Mr. Webb resigned from the board of directors, and Mr. Josselyn was elected in his place. Mr. Webb also resigned as vice-president and director of the Baltimore Electric Power Company, and Mr. Josselyn succeeded him.

Mr. Josselyn, the new vice-president of the company, is a Philadelphian, and represents the Philadelphia interests in the

Digitized by Google

company. He has been in the president's office about three months.

After making the changes in the officers the directors elected the following executive committee: Messrs. Sidney L. Wright of Philadelphia, George R. Webb, John Waters, David E. Evans and Bernard N. Baker.

INDIANA INDEPENDENTS DENY MERGER WITH BELL.

MANAGER W. L. MOELLERING, of the Home Telephone and National Telegraph Company, has denied in most emphatic terms a story sent out from New York to the effect that the Bell Telephone Company had made overtures to purchase the properties of the local Independent company, and he stated positively that no such deal would be made or even considered. The story sent out was as follows:

"New York.—It is reported in electric and telephone circles in Wall Street that the American Telephone and Telegraph company, the corporate name of the old American Bell, is to quietly acquire through local capitalists all the desirable local systems in Ohio, Indiana, Illinois and Michigan and has secured the National Telephone system and Home Telephone Company, of Fort Wayne, also the local systems of South Bend, Cambridge City, Hagerstown, Kendallville, Auburn, New Haven and others. The story is neither affirmed nor denied at the office of the company here. President F. P. Fish is now in the West looking over properties. The company has just issued one hundred and fifty millions of bonds to buy the new lines."

Theodore Thorward, manager of the system at South Bend, has stated that George W. Beers, who is president of the Indiana Association of Independent telephone companiees, told him that the story sent out from New York was a series of fabrications, pure and simple, and that statements made in the New York dispatch could not possibly be true, as one of the conditions of the transfer of plants and exchanges to the Independent telephone corporation is that the plants must not pass into the hands of the Bell company.

W. B. Woodbury, who has been assistant general manager of the Cuyahoga Telephone Company, has resigned this position, and will represent the syndicate which intends to build up an Independent telephone system at Detroit, Mich., during the construction of its plant.

PROGRESS BEING MADE IN ARIZONA.

INDEPENDENT telephone service is being rapidly developed in Arizona. The Sonora Telephone Company is extending its lines from Hermosillo, Arizona, in several directions, connecting the capital with several widely separated localities. A line is in operation between Hermosillo and La Colorado (Minas Prietas), and this is now being extended to Suaqui de Batuc. It is at present in operation as far as Matape, a point about fifty miles eastward from Minas Prietas, and eighty-five miles from Hermosillo. Another line is being built up the Sonora River, connecting Hermosillo with the towns of San Miguel de Horcasitas, Los Angeles, and Rayon. It will reach Opodepe within a short time. From the latter place it will be extended to Tuape, Cucuripe, and other points northward, eventually reaching both Nogales and Cananea.

GOOD FINANCIAL SHOWING OF DULUTH COMPANY.

STATING that $26,779.38 was expended in improvements last year, and giving the cost of the plant at $379,597.37, the Zenith Telephone Company, of Duluth, Minn., has filed with the city comptroller, as required by the charter, its annual sworn financial statement.

With an expense of $43,908.43, and revenues of $62,437.37 from telephone rentals, and $1,646.13 from toll lines, the company reports the balance of receipts over expenditures at $20,175.07.

In its list of actual liabilities, debts, encumbrances and obligations, the company gives the following:

1862 shares of stock at $100	$186,200
Bonds	100,000
Preferred stock	104,300
Accounts	8,399
Total	$398,899

It is stated that in the matter of construction last year, the company expended $12,068.20 in salaries and wages, $13,887.98 for overhead, and $823.20 for underground material.

WEBSTER CITY IN THE CENTRE OF DEVELOPMENT IN HAMILTON COUNTY.

HAMILTON COUNTY, Ia., is at present the scene of great activity in Independent construction. The Martin Telephone Company of Webster City is building several new toll lines, and is making preparations to install new exchanges at Stanhope and Stratford. Two new lines are under construction to Waterloo, and others are being built into Blairsburg, Williams, Kamrar and Jewell.

By traffic arrangements with the Woolstock Company, the Martin Company will inaugurate a ten cent rate to that point.

INCREASED TOLL FACILITIES FOR SOMERSET COUNTY SUBSCRIBERS.

ARRANGEMENTS were recently made by the Somerset County (Pa.) Telephone Company, whereby its patrons could reach points in the territories of twelve other systems. Amongst the new toll points are Berlin, Boswell, Stoyestown, Lincoln, Hooversville, and Rockwood. The Somerset County Telephone Company was the pioneer in this part of the State. It has always been progressive, and, as a result, its lines virtually cover the county. The officers of the company are A. F. John, of Johnstown, president; F. W. Beisecker, vice-president; H. M. Berkley, treasurer; Josiah Swank, secretary. The directors include the officers and E. D. Schade of Johnstown, E. M. Beachley and Harry Straub of Meyersdale.

HOME COMPANY OF MOBILE REACHING OUT AND IMPROVING CONSTRUCTION.

COAST resorts in Alabama will shortly have Independent connection with Mobile. The Home company has recently finished laying submarine cables across the Mobile, Spanish and Texas rivers, which formerly prevented the extension of the lines of the Mobile company to those points. The entire system in Baldwin County, which was recently secured by the Home company, is to be rebuilt, and many other extensions and improvements will be made.

NEW INDEPENDENT COMPANY IN CYGNET, OHIO, GIVING EXTENSIVE SERVICE.

THE Oil Belt Telephone Company, of Cygnet, O., connects with all Independent telephone companies for long distance service and gives its subscribers free service to Bowling Green, Sugar Ridge, Scotch Ridge, Cloverdale, New Rochester, Portage, Rudolph, Dukay, Bays, Mermill, Mungen, Trombley, Cygnet, North Baltimore, Bairdstown, Van Buren and Galatea, and will extend its lines as rapidly as possible to other surrounding towns. There are now sixty-one telephones connected to the Cygnet switchboard and new business is coming in rapidly.

QUERIES

COIL CONNECTIONS.—(659.)

Will you please explain how the windings are placed on a coil to make them work against each other, also to work in unison? V. L.

In the accompanying illustrations, Figs. 659a and 659b, are shown the arrangement of connections to produce the results you mention. In Fig. 659a the coil is provided with two windings A C and D E. These two windings are connected to work together, that is, in such a manner that the lines of magnetic force will form a continuous circuit throughout the core. This method of connecting produces what is called an inductive winding, and when this is the result of joining two or more coils in series, as in this case, the coils are commonly said to "work together." The fact that the magnetic circuit is closed, and that the magnetic lines of force are continuous throughout the entire core, may be deduced from an application of a familiar rule to determine the direction of the magnetic lines when the direction of the current flow is given. The rule is that, when one is looking at the end of an electromagnet, the pole which is nearer to him is the south pole if the current is passing around the magnet in the same direction as the rotation of the hands of a clock; if passing in a reverse direction, the north pole is nearer to the observer. In applying this rule to Fig. 659a, if the observer stands at the right it will be seen that winding A C will produce a north pole, G, at the nearer end, and the winding D E a south pole, H. Looking at the coils from the left, the winding D E produces a north pole, F, at the nearer end, and the winding A C produces a corresponding south pole, I. In this manner it will be seen that the north pole is always adjacent to the south pole in every part of the core, and the lines of force are, therefore, continuous. It is advisable to state that it makes no difference in the application of the above rule whether the wire is wound on a right hand or left hand spiral; it is the direction of the current, considering it as passing from the positive pole of the battery to the negative pole which counts.

In Fig. 659b is shown the arangement of the same coil, connected up in such a manner that the magnetic lines are not

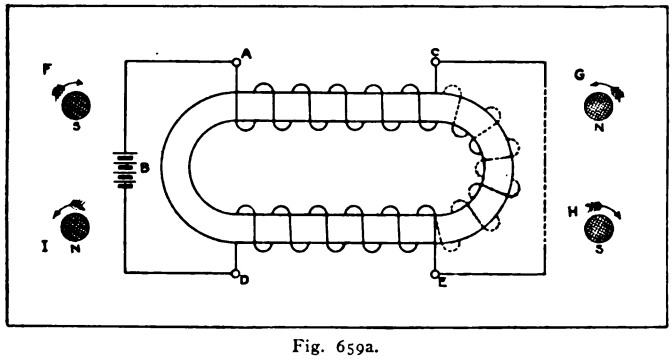

Fig. 659a.

continuous, at which time the two windings are said to work against each other. In this case the connections of the coil A C are such that the direction of rotation of the electric current is opposite to what it was in the previous case. By an application of the clock rule it will be seen that in the middle of the core a south magnetic pole is next to another south pole; and on the other side a north pole is next to a north pole, the polarity of sections II, I being opposite to that in the previous cases. As it is well known that like magnetic poles repel each other, the origin of the statement that the coils work against each other is evident. It will be observed that the method of securing this result is to reverse the connections of one winding. If both were reversed the magnetic polarity throughout the whole core would be reversed, but, at the same time, the magnetic force would be continuous in direction.

Another simple method of determining whether both windings are working together is illustrated in Fig. 659a. If the two coils are connected in such a way as to have the effect of a single spiral

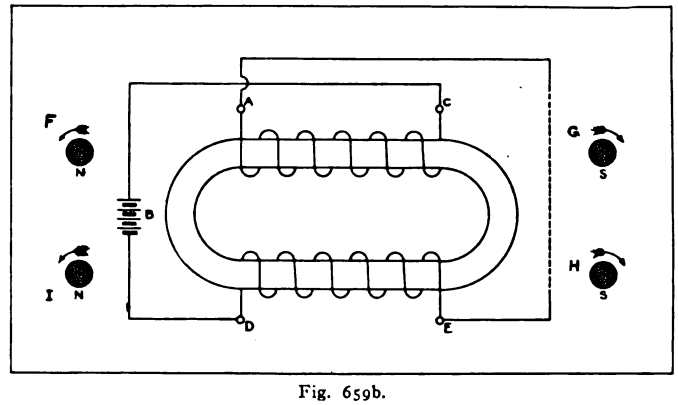

Fig. 659b.

winding carried continuously around the core in the same direction, as would be the case if the connection C E, instead of being through the line, etc., were carried continuously around to the iron, as indicated by the dotted spiral lines.

The diagrams show a battery as the source of current. The principle is the same if the current is due to ringing or other alternating current, which is only a succession of direct current impulses passing in first one direction and then in the other.

DISTURBANCE ON TELEPHONE LINES FROM WIRELESS TELEGRAPH FIELD.—(660.)

Is there any method for preventing the receipt on telephone lines of message from a wireless telegraph station located near the lines? Are such currents heavy enough to ground the carbons of an arrester? F. J. C.

When a telephone line is located near a wireless telegraph station, the electrostatic field of the wireless may be so intense that a constant stream of sparks will pass across the carbon plate lightning arrestors at the telephone station while the key is sending an impulse at the wireless station. This difficulty may be readily overcome by connecting two condensers of equal capacity across each of the two carbon plate arrestors. These condensers should have a capacity somewhere between .1 and .5 microfarads, so that they will not appreciably affect the transmission on the line.

The wireless electrostatic field above mentioned is of an alternating nature and has a period of between 500,000 and 1,000,000 cycles per second, so that these condensers act as an almost perfect short circuit to ground for alternating currents of this nature, while for telephone currents having about 800 cycles per second, they offer sufficiently high resistance to not put any material shunt on the line.

If the telephone line is in the wireless station itself, the currents passing between the carbons will be sufficient to ground them occasionally.

In the case of stations located near the wireless station, the currents will probably not be sufficient to ground the carbons, if well brushed.

In conclusion it should be noted that an ordinary telephone transmitter in operation is a more or less sensitive receiver of wireless telegraph emanations, and under certain local conditions will cause the reproduction of wireless messages on telephone lines where the transmitter is located near the wireless station.

GRAY TEL. PAY STATION CO.

HARTFORD, CONN.

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE, CHEAP—600 pairs self-soldering protectors. Also one 300 pair and one 500 pair main distributing frame, used less than two months. Will sell separately or together. Address Virden Telephone Exchange, Virden, Ill., or Girard Telephone Exchange, Girard, Ill. 420

FOR SALE—Switchboard and apparatus, outgrown and displaced by automatic equipment: Kellogg switchboard, twenty 8-panel, 3-position, mahogany, equipped for 5,200 main lines, ultimate capacity 6,000 lines; Kellogg toll board of 9 positions; Kellogg telephones, 4,064 wall and 2,136 desk; Sterling terminal rack, with protection; power plant, with charging and ringing machines and storage batteries; offered for sale in whole or in part. For particulars address The Columbus Citizens' Telephone Company, Columbus, Ohio. 548

SUPPLIES WANTED

For use of operating companies wishing to purchase or sell second-hand equipment or supplies. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

WANTED—Second-hand telephones. State make of magneto, transmitter, receiver, style of backboard, time telephones have been in service. Address LaFayette Telephone Co., LaFayette, Indiana. 536

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

WANTED—Experienced telephone men of good appearance and address as traveling inspectors for the Engineering Department. We need men to fill vacancies caused by recent promotions. Address George J. Yundt, Engineer, Southern Bell Telephone & Telegraph Company, Atlanta, Ga. 530

WANTED—Continued

A SQUARE deal is what we aim to render both employer and employee, when seeking the right man for a place, or the right place for a man. Without effort on your part, without endangering your present position, and without using your employers' time, we hunt up the position for which you are best qualified. Let us find the positon for you. Hapgood's, Suite 511, 309 Broadway, New York City. 464

WANTED—Permanent position in the West or Middle West by competent cable splicer. Address Box 545, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 545

WANTED—Young men not over 22 years of age, preferably high school graduates, to enter apprenticeship course of a large telephone factory where they will be trained to install and operate large modern switchboards. Address, stating age, education and electrical experience, Box 546, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 546

WANTED—Position as manager, superintendent or wire chief. Eleven years' experience; good, all-around telephonist. Can take complete charge of from 1,000 to 2,000 subscribers. Address G. W. J., manager Home Telephone Company, Uhrichsville, Ohio. 547

WANTED—Telephone salesman. A large telephone supply house located in the Southwest wants a first-class traveling man. As briefly as possible, give experience, references and description. Address Box 542, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 542

WANTED—An active partner with some money to put in a good paying telephone business. Owner is forced to take this action because of lack of capital to carry on rapidly expanding business. Address Box 543, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 543

HELP WANTED—Large telephone company desires a full equipment of good men and women, must be experienced; give full description in application. 549

TELEPHONE PATENTS

SELECTIVE SYSTEM.

William Palmer, Jr., Rincon, New Mexico, patents (No. 810,878, dated Jan. 23, 1906; filed July 18, 1902; serial No. 116,075) a selective call for telephone and telegraph systems.

This patent relates to that class of selective systems which rely upon a step by step movement to bring the desired station into circuit. Its novel feature is a circuit arrangement whereby two parties on the same wire can talk together without interference. Owing to the complicated arrangement of the parts of mechanical devices designed to accomplish the inventor's purpose, which require six sheets of drawings for elucidation, we are unable to fully describe this patent in the space at our disposal, and would, therefore, suggest that all parties interested secure a copy.

TELEPHONE HOLDER.

Louis S. Hallowell, New York, N. Y., patents (No. 808,983; dated January 2, 1906; filed March 28, 1905; serial No. 252,537) and assigns one-half to Thomas L. Ricart, Philadelphia, Pa., a telephone holder. The object of this invention is to provide a holder which will be adapted to retain a telephone stand at-

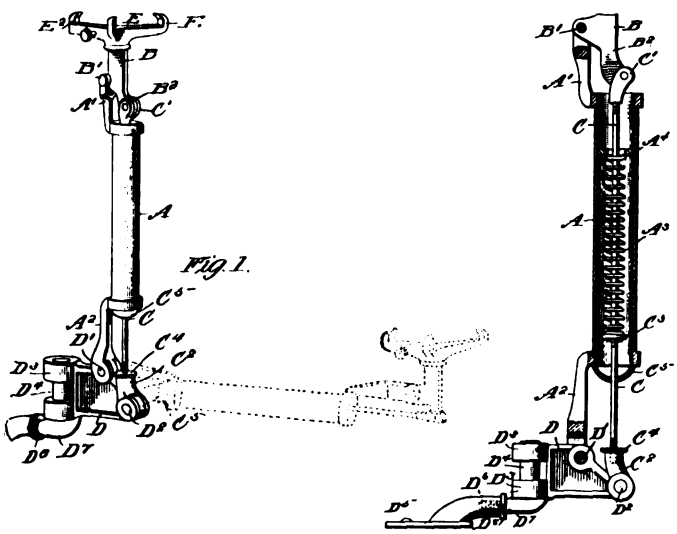

Fig. 1.

tached in any position within the arc of travel of a counterbalanced arm. For this purpose a hinged base *D* is provided, to which is attached a tube *A* and rod *C*. A clamping device *B*, to receive the telephone, is attached to the tube *A* by a pivot *H*, and to rod *C* by pivot C^1. Within the tube *A* is a flange A^4, having an opening in its center for the rod *C*. This flange acts as a stop for spiral spring A^3, surrounding the rod *C*, the other end of which is retained in position by an adjustable seat C^3 attached to the rod. Owing to the design of the arm and the relation of the pivotal points to the movable members the holder *E* will be maintained in a horizontal position undisturbed by the movement of the supporting arm. The spring A^3 acts as a counterbalance to offset the weight of the telephone and support and retains the arm in any position from the vertical to the horizontal.

WIRE CONNECTOR.

Nathaniel W. Lillie, Somerville, Mass., and Anton Freier, Boston, Mass., patent (No. 806,477, dated Dec. 5, 1905; filed Feb. 20, 1905; serial No. 246,428) and assign to the Holtzer Cabot Electric Company, Brookline, Mass., a wire connector.

This invention discloses improvements over the ordinary wire connector as follows: The central portion is made softer than the ends by tempering so that in the process of twisting a good electrical connection can be secured between the surface of the wire and the conductor; also it can be so made that when it is required to connect a branch conductor to a main line the main

Fig. 5.

Fig. 6.

line wire can be laid in a groove and the connection made without it being necessary to cut the main line wire.

These features are indicated in Figs. 5 and 6, the edge a^3 being formed into a recess into which a wire may be introduced. The closed loop portion serves to hold the branch wire and the joint is completed by twisting in the usual manner.

ANCHOR.

George F. Swortfiger, Newark, N. J., patents (No. 809,032, dated Jan. 2, 1906; filed August 1, 1905; serial No. 272,210) an earth anchor.

This device consists of a shaft having a threaded lower extremity, to which are attached two wings which normally fold upwards in a vertical position. After a hole has been made the anchor is inserted and the shaft revolved. This causes the supporting frame to be withdrawn along the threaded portion toward the surface of the ground, thereby forcing the wings to spread outward and engage the surrounding earth. By revolving the shaft the wings may be made to assume a position at right angles to it and thus offer a great resistance to its withdrawal. Revolving the shaft in the opposite direction causes the wings to fold up and in this way the anchor may be withdrawn.

GROUND ANCHOR.

Ezra C. Holden and Harry Holden, Des Moines, Iowa, patent (No. 809,374, dated Jan. 9, 1906; filed Dec. 9, 1904; serial No. 236,101) a ground anchor.

This device consists of a curved longitudinal plate having its ends rounded off into the form of scoops. Adjacent to each end is a strap which encircles the exterior and is provided with eyes to which rods or wires are attached. In operation a hole is first dug with an earth auger. The curved plate is then allowed to slide into the hole to the required depth in a vertical position. The wires or rods attached to the strap fastened to the lower end of the curved plate are then pulled, which operation causes the scoop-shaped ends to dig into the earth, and if the strain is continued long enough the plate will lie at right angles to the hole, with both ends firmly imbedded in the adjacent earth. The entrance hole is then filled up and the anchor is set. To withdraw, the wires or rods attached to one end of anchor plate are pulled till the latter is drawn into a vertical position, when its further removal may be readily accomplished by a continued strain.

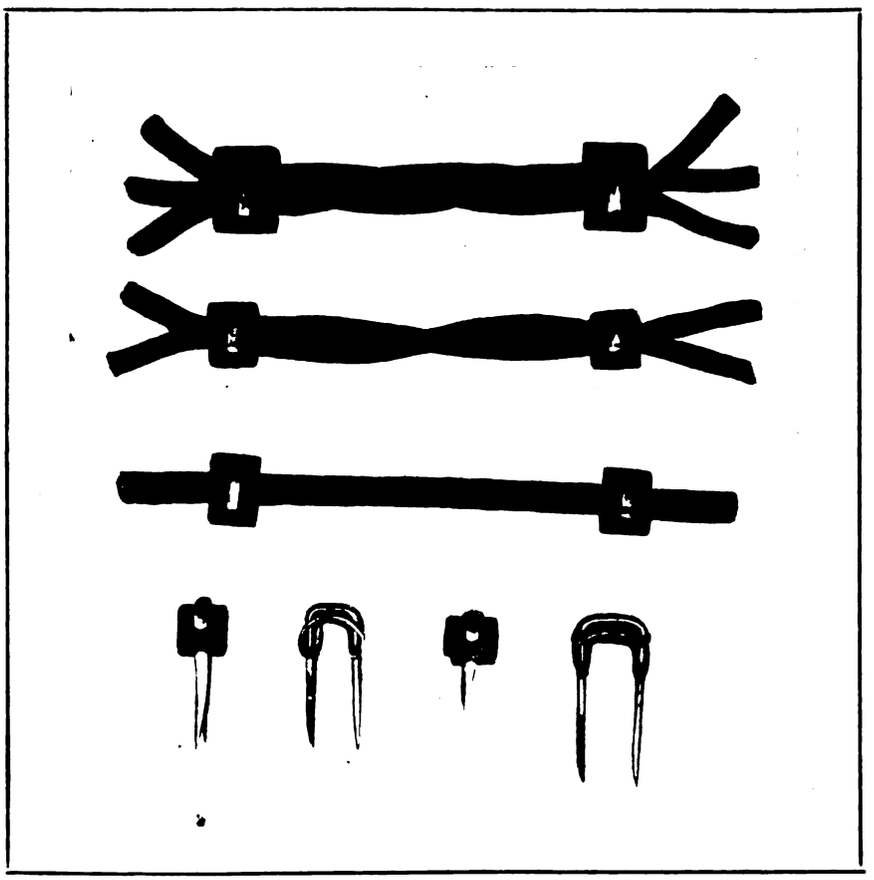
IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

A NEAT AND ECONOMICAL WIRE FASTENER.

THE advantages of the use of staples for fastening wires upon woodwork in exposed locations are generally recognized. A careful workman can by their use run a wire in a manner which makes it much more inconspicuous than when cleats are employed, and this method of fastening very frequently does away with the necessity for concealed work. It not only effects an economy for this reason, but also from the fact that a considerable saving in the workman's time may be made and the cost of the staples themselves is low.

To the plain staple there are numerous practical objections. It is likely to bend or turn when driven, and thus fail to secure a grip strong enough to securely hold wires of the size commonly used for telephone work. If used on paired or triple wire the staple cannot be used over the whole group of wires without introducing the danger of a cross, or, at least, a point of poor insulation. This is sometimes obviated by driving the staple over a single wire, but this method does not properly hold the run in place, and the wire soon sags, presenting a very unattractive appearance.



The Blake Insulated Staples May Be Used to Neatly and Firmly Fasten Single, Paired or Triple Wires.

The difficulties mentioned have been overcome in the Blake Insulated Staples, made by the Blake Signal and Manufacturing Company, 246 Summer street, Boston, Mass. These are standard, square shouldered staples, with good driving qualities. By a special process a fibre-insulated strip is attached to each staple, in a manner which may be clearly understood from the illustration. This provides a double thickness beneath the head of the staple, which, in addition to its insulating properties, gives a large surface of contact with the wire. When stringing long lines of wire the end staples will hold the slack until the wire is secured at intermediate points. The insulation gives an added protection on leaks to ground if the wire happens to be in a damp place, and enables the staple to be driven over two or more wires without danger of producing a cross. The staples are tinned to prevent corrosion. The insulation is made of gray fibre, unless black or red fibre is specified. The gray fibre is recommended by the manufacturers, as it it without coloring matter, although colored material can be readily furnished if desired.

The illustration shows the staples in use upon three standard wire combinations. The staples and wires are reproduced in the exact size of the original articles photographed. For managers who wish to secure a staple provided with an insulation that cannot come off in driving this will be a most satisfactory product. It is adapted for use not only on telephone wires, but for messenger call, annunciator and bell work, and, in fact, all low voltage interior wiring. The manufacturers state that wiring can be done with these staples in one-half the time required for cleat work, and that the staples cost less than the screws alone which are necessary for porcelain cleat work. They will furnish further information and prices upon receipt of inquiries.

THE MOUNTAIN STATE ELECTRICAL COMPANY, Wheeling, W. Va., is at present in an excellent position to quote prices and furnish its Hall type cable terminal. During the past year this terminal had a very large sale and is being used by many of the important companies in the country. It is expected that the demand will be greatly increased this year, and the company would therefore suggest that parties contemplating cable construction and extensions place their orders early to insure prompt delivery. Full particulars respecting this apparatus will be furnished upon request.

THE TOLEDO STORAGE BATTERY COMPANY of Toledo, O., has decided to erect a new building. The present quarters have become entirely too small for the concern's business, and it is expected that work on the new plant will begin in the early part of the summer. The structure, when completed, will give several times as much space as the present quarters. The officers of the company, which was organized recently to take over the business of the Toledo Storage Battery & Electric Company, are as follows: President, C. E. B. Lamson; vice president, C. A. Byers; secretary and general manager, L. B. Hamilton; superintendent, George J. Miller. The board of directors are the above and Joseph M. Grasser, L. A. Alexander and J. Tyler Green.

THE FAIRBURY TELEPHONE COMPANY, of Fairbury, Neb., which has just successfully completed one of the hottest telephone fights in the history of competition, is indicating aggressive tendencies by putting the Baird secret service system on its party lines. The company intends to make use of all facilities which will aid it in giving a most satisfactory service to its subscribers.

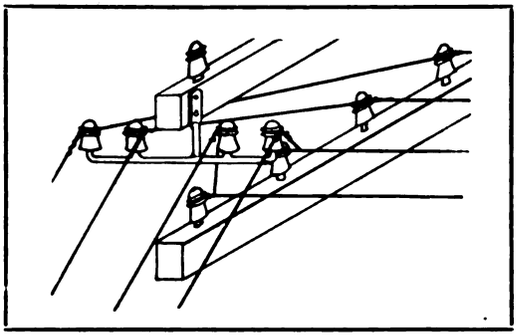
IN THE MANUFACTURING FIELD

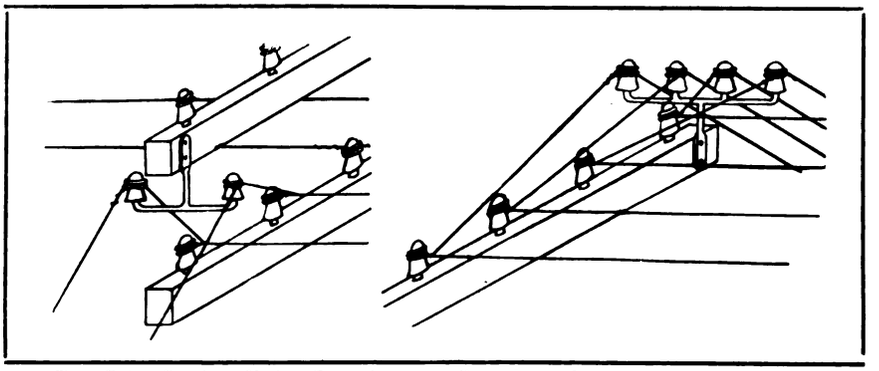
AUXILIARY POLE BRACKETS.

FOR taking off taps to subscribers' stations, or leads on party lines, and making turns where part of the wires upon a cross-arm continue straight ahead and the remainder are led down a side street, the use of a metal cross arm bracket presents some very definite advantages. It enables the wires to be taken off in a manner which presents a very sightly appearance, and this makes it especially satisfactory for use on open wire lines in thickly settled districts. The wires may be taken off in a line parallel to the cross-arm by their use, and this is frequently desired, as it lends itself to neat and workmanlike construction, without incurring the danger of a loop cross by too near approach of the separate conductors.



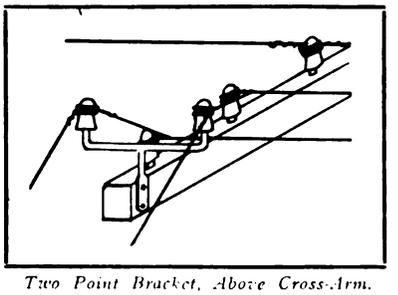
Four Point Bracket Set Beneath Cross-Arm.

The Norton Tool Company, of West Park, O., makes brackets which may be clamped on cross-arms in such a manner as to extend either above or below the arm. These are designed to have sufficient strength to stand any strain which may be put upon them by an ordinary length of span, even under extremely severe conditions. The illustrations upon this page show the methods of applying the two point and four point brackets to cross-arms, and give an idea of the appearance of this form of construction. As it not only improves the appearance of the line, but is likely to effect economies, by doing away with the use at these points of insulated wire which is likely to deteriorate, and by diminishing the frequency of crosses or low insulation at junction poles, the use of these brackets should be a valuable feature on line work in many places. The company manufactures a line of brackets, clamps and hangers, in which especial attention is paid to securing material and workmanship of the highest grade, as well as doing special work to order. It will be pleased to furnish further information and prices to all persons interested.



Two Point Bracket, Under Cross-Arm. *Four Point Bracket, Standing Above Arm.*

THE INTERNATIONAL TELEPHONE MANUFACTURING COMPANY, of Chicago, recently installed a special type Despatcher's switchboard for the St. Louis & Springfield Railway Company at Staunton, Ill. It is especially arranged to meet exacting conditions.



Two Point Bracket, Above Cross-Arm.

THE STROMBERG-CARLSON TELEPHONE MANUFACTURING COMPANY, Rochester, N. Y., and Chicago, Ill., is distributing an artistic folder which describes its new transmitter. This instrument is a radical departure from any heretofore devised and, the manufacturers claim, embodies the most approved details of transmitter design. Chief among these is the increased range of resistance variation, which especially fits it for long distance transmission, as well as extremely satisfactory work on short lines. The results of a long series of experiments are embodied in the arrangements of the parts which are contained within a heavy brass case. No pains have been spared to make this transmitter as nearly perfect as possible, and in the description furnished in the folder every part is clearly described. Copies may be obtained from the company on request.

THE ELECTRIC APPLIANCE COMPANY, Chicago and San Francisco, is manufacturing a special switchboard cord known as the Eaco. Each conductor consists of a highest grade piano steel wire surrounded with a spiral of fine copper wire. A covering of cotton braid is then placed on the wire; one of each pair having a distinguishing thread for bracing purposes. The wires are laid in position and protected by a covering of silk and cotton. They are then formed into a spiral and enclosed in a final covering of heavy waxed gray Gilling thread. On account of the combination of steel and copper the manufacturers claim to secure a cord which has an exceptionally long life with high conductivity. Prices and further particulars will be furnished upon request.

THE CENTURY TELEPHONE CONSTRUCTION COMPANY, Buffalo, N. Y., is meeting with an increasing demand for its common battery type instruments. Bulletins describing this apparatus will be sent upon request.

A PRIVATE LONG DISTANCE WIRE.

THE Standard Underground Cable Company has leased the exclusive use of an all copper line to connect its general offices and the factories at Pittsburg, branch offices at New York and Philadelphia and its Eastern factories at Perth Amboy. This private line will be available for either telegraph or telephone service. There could be no better evidence of the large aggregate volume of business and the growing condition of this important manufacturing company, for so far as known this will be the longest exclusive wire owned or operated by any company confining itself to the manufacture of copper wire and cables. This service went into effect January 1st, 1906, and while without doubt of great convenience and value to the company in facilitating communication between its offices and factories and the important market centers of New York, Philadelphia and Pittsburg, it is installed primarily to enable it to place itself in closer touch with its customers and to give these customers the same quick service that would be possible if its general offices were located in each of these cities instead of in one.

AIBMULOC

There is something wrong with that word. It isn't put together right. If you spell it backwards it will form the word "Columbia," the name of our telephones. It's just the same way with many of the telephones on the market. They have all the parts but they are not put together right. That's where they differ from ours.

When you buy a "Columbia" you get an instrument that is right all the way through.
You don't get a piano finish on the outside and a scrap heap on the inside.
Every part is built for efficient service under all conditions and it stays that way.
We'd like to have you write us for prices, we are sure you will never regret so doing.
We will buy your old telephones and switchboards.

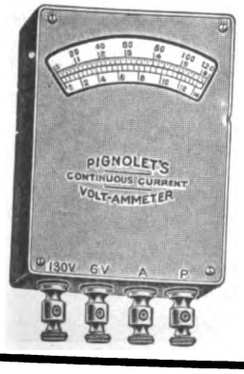
CHEAP VS. EFFICIENT SERVICE



The cheapest telephone service in the world is dear at any price if it is not efficient.

When a man installs a telephone he wants to be able to use it and not to abuse it.

A grounded line nine times out of ten is noisy, and foreign noise on a telephone line will arouse a feeling of anger in the heart of the user that isn't good for the company. You can keep your lines free from grounds and other troubles by periodic tests with a Pignolet voltmeter, and when they do occur, you can locate them with this instrument, and get them cleared often before the subscriber knew his line was in trouble.

If you need your subscribers' good will, you need my voltmeter to get it.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit
78 CORTLANDT ST., N. Y.

THE WEEK'S MESSAGES

FINANCIAL.

ALMA, MICH.—The Union Telephone Company, of Alma, has increased its capital stock from $500,000 to $750,000.

TILDEN, NEB.—The Tilden Telephone Company has increased its capital stock from $3,000 to $6,000.

NORTHWOOD, N. Y.—The West Canada Remsen & West Canada Creek Telephone Company, Northwood, has declared a 7 per cent. annual dividend.

MONROE, WIS.—The Monroe Telephone Company has increased its capital stock from $25,000 to $36,000.

THERESA, WIS.—The Theresa Union Telephone Company has increased its capital stock from $5,000 to $22,500.

FRANCHISES.

MILLSTADT, ILL.—The Farmers' Mutual Telephone Company has applied for a franchise to install an exchange at Millstadt, connecting with its party lines.

BERGEN, N. Y.—The Inter-Ocean Telephone Company has been granted permission to enter Bergen, connecting Le Roy and other places with Bergen.

COMBINATIONS.

FORT DODGE, IA.—The Fort Dodge Telephone Company has purchased the telephone system formerly owned by Ware and Leland. The Fort Dodge Company is installing a new switchboard that will handle double the toll service. It is to have a copper circuit to Dubuque, and three distinct routes into Des Moines.

SHEFFIELD, IA.—The People's Mutual Telephone Company, that operates toll lines and exchanges between and at several towns in Franklin and Cerro Gordo counties, has been sold to a new syndicate headed by C. F. Johnson. Associated with Mr. Johnson are E. N. Egge, of Rockwell, and C. M. Felland, of Joyce, Ia. Mr. Egge will be the new manager of the company, and the headquarters of the company will be moved from Hampton to Sheffield.

TAMA, IA.—C. W. Smith, former owner of the Tama Telephone Company, has bought from W. D. Spayth the Toledo exchange and lines. The system will be put in first class condition.

FORESTVILLE, N. Y.—The Hanover Telephone Company, owned by Silver Creek parties, has been transferred to the Inter-Ocean Telephone Company. The lines between Forestville and Silver Creek will be overhauled, and the exchange at Forestville considerably enlarged.

ELECTIONS.

BELVIDERE, ILL.—The Belvidere Telephone Company has elected the following directors: J. R. Balliet, F. S. Rowan, Wm. M. Marean, Geo. T. Keator and M. C. Marean.

GRAND MOUND, IA.—The Farmers' Mutual Telephone Company has elected the following officers: President, A. A. Barber; vice-president, A. M. Miller; secretary, John Mients; treasurer, Will Crowley; trustee, Henry Wieck.

HANLONTOWN, IA.—The Hanlontown Co-operative Telephone Company has elected the following officers: L. M. Gesme, president; N. N. Storre, vice-president; N. W. Phillips, secretary and treasurer.

HUBBARD, IA.—The Hubbard & Buckeye Telephone Company has elected the following officers: O. G. Lewison, president; Ed. Brightwell, vice-president; Herman Clute, secretary; T. Whaley, treasurer.

NORDNESS, IA.—The Nordness Telephone Company has elected the following officers: President, O. O. Lomen; manager, J. Brown; auditor, O. J. Thorgrimson.

BELLEVUE, O.—The Bellevue Telephone Company has elected the following officers: President, P. A. Knapp; vice-president, J. P. Ruffing; secretary, Fred Wolfrim; treasurer, J. H. Beattie.

WELLSBORO, PA.—The Farmers' Mutual Telephone Company has elected the following officers: President, Francis Kelley; vice-president, J. F. Haverly; secretary, Fred. H. Niles.

LACOHNER, WASH.—The Skagit Valley Telephone Company has elected the following officers: S. P. Kendall, president; O. J. Viurgren, secretary; N. A. Nelson, treasurer.

EVANSVILLE, WIS.—The Evansville Telephone Company has elected the following officers: A. S. Baker, president; A. C. Gray, vice-president; R. M. Richmond, secretary; Geo. L. Pullen, treasurer; G. W. Leyda, superintendent.

NEW COMPANIES.

MONTEZUMA, GA.—The Montezuma & Oglethorpe Company has been incorporated with a capital stock of $5,000.

ELBA, ILL.—The North Elba Telephone Company has been organized with the following officers: President, F. E. Potts; secretary Richard Murphy; treasurer, J. C. Breece. The company will build and operate a line between Elba and Williamsfield.

FLAGG CENTER, ILL.—The Farmers' Telephone Company, of Flagg Center, has been incorporated with a capital stock of $2,500. Incorporators: A. J. Bain, John Weiner and A. E. Slaughter.

TREMONT, ILL.—The Peoria, Pekin & Tremont Telephone Company has been incorporated with a capital stock of $2,500. Incorporators: A. J. Davis, Walter H. Ames and S. A. Hayward.

CRANDALL, IND.—The Excelsior Telephone Company, of Crandall, Ind., has been incorporated with a capital stock of $6,000. The company will establish an exchange in Crandall, and telephone lines throughout Harrison, Floyer, Orange, Washington and Crawford counties. John W. Gresham, chairman Board of trustees.

EVANSVILLE, IND.—The Citizens' Telephone Company, of Evansville, has been incorporated with a capital stock of $10,000. The company proposes to establish an exchange in Evansville, and extend its lines throughout Vanderburg and adjacent counties. Albert T. Karges, A. P. Lahr and others directors.

EXLINE, IA.—The Caldwell Mutual Telephone Company, with its principal place of business at Exline, has been incorporated with a capital stock of $1,000. The officers are as follows: President, F. M. Tull, Exline, Ia.; vice-president, Wm. Traxler, Exline, Ia.; secretary, John Leonard, Cincinnati, Ia.; treasurer, Euras Johnson, Exline, Ia.

KNOX, IA.—The Knox Mutual Telephone Company has been incorporated with a capital stock of $10,000. E. S. Murphy and others are the incorporators.

SEDAN, MINN.—The Sedan Telephone Company, of Sedan, Minn., has been incorporated with a capital stock of $2,500. Incorporators are William Wolfe, Henry Hess, W. E. Martin, of Sedan; A. Woodhall and M. C. Whitney, of Grove Lake.

CALDWELL, O.—The Noble County Telephone Company, Caldwell, has been incorporated with a capital stock of $100,000. Incorporators are F. H. Kuntz, P. H. Bowson, J. S. Jones, W. P. Shively and L. W. Wheeler.

NEW LEXINGTON, O.—The Citizens' Independent Telephone Company has been incorporated with a capital stock of $50,000. Incorporators: J. B. Rhodes, T. J. Smith, Charles H. Bell, J. W. Fry and J. G. Morris.

CARR, OKLA.—The Carr Gin, Milling & Telephone Company, at Carr, Day Co., Okla., has been incorporated with a capital stock of $6,000. The directors are: E. R. Black, A. Black, H. W. Carr, A. Standlee and J. J. Neally, all of Stone, Okla.

CLYDE, OKLA.—The Lyle and Clyde Telephone Company, of Clyde, has been incorporated with a capital stock of $10,000. Incorporators: William Wilson; Lester Lum and Fred Gum.

HEADRICK, OKLA.—The Navajo Telephone Company, of Headrick, has been incorporated with a capital stock of $1,000. The incorporators are W. J. Hastings, Jonathan F. Knox and others. The company will build a line from Headrick to Warner.

EAST HANOVER, PA.—An Independent Telephone Company has been

NEWS—WANTED

THE matter contained upon the Message and Operating Field pages of this paper is contributed largely by our special correspondents. We believe, however, that there are many valuable items of telephonic interest which are never brought to the attention of the public. There is no reason why this condition should exist, and the Editor, therefore, invites all telephone companies and the officials of such companies, to furnish any information that they can consistently make public relative to financial statistics, new construction, elections, franchises and personal items.

OUR MOTTO—QUALITY AND PROMPT SHIPMENTS.

KELLOGG "MICHIGAN WHITE" CEDAR POLES

THE poles we handle are all carefully selected, and are the best grade of stock.

All shipments are prompt, subject only to car supply.

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices.

We have recently published a little book giving some very valuable information about Cedar Poles. It contains Specifications, Inspection Comments, Shipping Data, Etc. "Yours for the asking."

THE WEEK'S MESSAGES

organized at East Hanover, with the following officers: President, A. S. Rank; secretary, J. R. Mader; assistant secretary, S. N. Ulrich; treasurer, Samuel Fry. The company has applied for a charter, and, as soon as it is granted, the company will begin the erection of a line between Jonestown and Grantville.

BONESTEEL, S. D.—The Gregory County Interstate Telephone Company, at Bonesteel, has been incorporated with a capital stock of $100,000. The company's lines will cover practically every town in Gregory County, with an estimated length of one hundred miles. The incorporators are M. Krotter and S. M. Lindley, of Bonesteel; C. A. Johnson, Fairfax; L. Simons, Herrick; R. A. Jackson, Dallas; N. E. Gardner, Gregory, and others.

CASCADE SPRINGS, S. D.—J. G. Neith and Fred Noerenberg, of Cascade Springs, have organized a telephone company to build a line from Hot Springs to Cascade Springs, and out into the Hot Creek County.

HENRY, S. D.—The Union Telephone Company has been incorporated with a capital stock of $10,000. Incorporators: John T. Belk, Henry A. Hanson, Nels M. Hanson and Ernest Roinecke.

HITCHCOCK, S. D.—The Pioneer Rural Telephone Company has been incorporated with a capital stock of $5,000.

HOT SPRINGS, S. D.—The Fall River Rural Telephone Company, at Hot Springs, has been incorporated with a capital stock of $30,000. Incorporators are D. O. Kimball, Jacob Burg, W. C. Timma, Thomas Getty, of Hot Springs.

LANGFORD, S. D.—The Langford Telephone Company has been incorporated with a capital stock of $22,500. The company will operate in the counties of Marshall, Day, Roberts and Brown. The incorporators are C. W. Platt, J. F. D. Cook, Howard Platt, C. B. Hersey, W. H. Sherrard and others at Langford.

LILLY, S. D.—The Lilly Local Telephone Company has been incorporated with a capital stock of $3,750.

MENNO, S. D.—The Menno Rural Telephone Company has been incorporated with a capital stock of $25,000. Incorporators: G. Munsmer, N. H. Claggett and Peter Gundmunson.

VALLEY SPRINGS, S. D.—The Red Rock Telephone Company has been incorporated with a capital stock of $1,500. Incorporators are A. L. Spies, Elmer Olson, Valley Springs; O. E. Fanske, Colman; N. N. Graff, Martin Lee, Brandon.

PECOS CITY, TEX.—The Reeves County Telephone Company, of Pecos, has been incorporated with a capital stock of $2,000. Incorporators are W. C. Kelly, R. S. Johnson and W. D. Cowan.

BICKLETON, WASH.—The Eastern Klickitat Telephone Company has been organized, with headquarters at Bickleton. R. E. Jackson, of Bickleton is one of the incorporators.. The company is to build a line from Bickleton to Cleveland.

BLUE CREEK, WASH.—The Blue Creek & Columbia Telephone Company has been organized with the following officers: B. Oppenheimer, president; C. W. Stanley, vice president; A. N. Anderson, secretary; C. G. Denison, treasurer. The company will build and operate lines between Blue Creek and Bissell, Cedonia and other points along the Columbia River.

REEDY, W. VA.—The Reedy & Spring Creek Telephone Company has been incorporated with a capital stock of $5,000.

COLOMA, WIS.—The Coloma Telephone Company, Coloma, has been incorporated with a capital stock of $3,000. Incorporators are F. W. Ploetz, J. N. Spalding, W. F. Gray and James A. Shorey.

HALE, WIS.—The Pleasant Valley Telephone Company, town of Hale, Trempealeau County, has been incorporated with a capital stock of $4,000. Incorporators: Leo L. Swain and others.

PERSONAL.

FRANK C. ADAMSON, formerly wire chief in the Michigan State Telephone Company's exchange at Detroit, has accepted a position as chief inspector with the Delaware and Atlantic Telephone and Telegraph Company.

J. SANDFORD BUCK has been appointed manager for the Rocky Mountain Bell Telephone Company at Missoula, Mont.

W. C. BUELL, formerly of Atlantic City, has accepted the position of division superintendent with the Interstate Telephone Company, with offices at Millville, N. J. The Millville District comprises all of Cumberland and part of Salem and Cape May counties.

CHRISTOPHER BUSSE, of Troy, Ind., has recently bought the Troy Telephone Company. The company has about 100 subscribers and secures toll connections over the lines of the Kinloch system.

ROBERT A. DAVIDSON has been appointed manager for the telephone company at Cheyenne, Wyo.

E. M. FORD, manager for the Wabash Valley Telephone Company at Effingham, Ill., has tendered his resignation. He will represent The Dean Electric Company in Illinois this year.

GEORGE A. FRENCH, formerly of the Southern New England Telephone Company, has been appointed superintendent of the Duluth and Mesaba Telephone companies, with headquarters at Duluth, Minn.

JAMES W. KRIEGER has been appointed local manager of the Consolidated Telephone Company at Pittston, Pa.

NED MATTERN has been appointed traffic manager for the Consolidated Telephone Companies with headquarters in Allentown, Pa.

A. V. SANBORN has been elected general manager of the Jewell County Telephone Company at Jewell, Kan.

MISCELLANEOUS.

FARIBAULT, MINN.—The Rice County Rural Telephone Company has issued a new telephone directory of thirty pages. It contains the usual instructions, a map showing the connections of the Tri-State Telegraph and Telephone companies, and has 765 local names classified and 13 which came in too late for classification, and 52 names on the rural lines running into Warsaw, Walcott, Shieldsville, Cannon City and elsewhere.

New Construction in the Field

STEPHENS, ARK.—T. A. Lewis and Gus Lewis have secured a franchise, and will build and operate a telephone system at Stephens.

DELTA, COLO.—The Delta County Co-operative Telephone Company contemplates the construction of many farmers' lines, and a number of improvements to its present system.

BOONE, IA.—The Boone County Telephone Company is to install about 20,000 ft. of cable in Boone and Ames. The improvement will cost in the neighborhood of $15,000. Additional improvements are also planned for the year.

DAYTON, IA.—The Dayton Telephone Company expects to extend its lines in the near future.

CAMBRIDGE, KAN.—The Pleasant Ridge Telephone Company is to construct fourteen miles of additional trunk line.

LEAVENWORTH, KAN.—The People's Telephone Company's system is to undergo a thorough modernization, including the installation of new instruments.

GLADSTONE, MICH.—The Finch Telephone Company of Escanaba, is to build a line to Gladstone, and install an exchange at that place.

STAPLES, MINN.—The Cass County Telephone Company, which has just completed a line to Staples, is to build a line to Thomastown.

BANNISTER, MICH.—The Bannister Mutual Telephone Company is to commence at once the construction of a line running west from the town.

HAVRE, MONT.—The Havre-Box Elder Telephone Company is to build a line thirty miles long, connecting Havre with Bear Paws. The company also plans to make connections with the Chinook-Lloyd line at Chinook.

WHITNEY POINT, N. Y.—The Chenango Valley Telephone Company is building a line from Whitney Point to Itasca.

ASHLEY, O.—The Ashley Telephone Company is to build lines to Marengo, Shawton and other points.

FORT SENECA, O.—The Farmers' Mutual Telephone Company is to build a line from Fort Seneca to Tiffin.

KENTON, O.—The Kenton Telephone Company is to build a farmers' line on Roundhead Pike.

SCHOLLS, ORE.—The Scholls Telephone Company is to have all its lines centralized to one point, and be connected direct with Portland by the Home Telephone Company.

BERLIN, PA.—The Berlin Telephone Company is to build a line to Nickleville and Kossuth.

CONESTOGA, PA.—The Conestoga Telephone Company is extending its lines to Stonersville and Yellow House.

VIBORG, S. D.—The Viborg & Center Point Telephone Company, which has recently completed a line between Viborg and Irene, is to build a line through to Centerville.

McKINNEY, TEX.—The Independent Telephone Company, which has recently been granted a franchise at McKinney, is to establish an exchange at that point.

EVERETT, WASH.—The Farmers' Independent Telephone Company is to install an up-to-date service at Everett.

BENWOOD, W. VA.—The National Telephone Company is to place a new toll board in its office at Benwood, and also contemplates the erection of a line to Moundsville.

SEVEN DISTRIBUTING YARDS

An Ounce of Prevention
is worth a pound of cure, especially when applied to poles. Unprotected poles do not last very long, and setting new ones takes time and labor in addition to the cost of the poles. We treat poles with creosote, which makes them invulnerable to the attack of insects or any of the rot diseases. If you are putting up poles to stay you must protect them. Creosoting them is the best way and we have the best facilities for this purpose.

THE D. & T. ANCHOR CO., La Crosse, Wis.

CABLE REEL WHEELS.

A HOME MADE DEVICE

may serve its purpose, but there are certain things that require expert knowledge in their design and construction. Take Cable Reel Wheels, for instance. They must be substantial to carry the heavy weights of cable and reels. They must be big enough to carry the largest reel, and they must be easily put together.

Ours have all these points and more, but we'd like to tell you about them by letter. We will say, however, that a complete equipment consists of a pair of six foot wheels with inside chafing plates, one 6-ft. reel bar, two outside locks to hold the wheels securely, and one adjustable tongue.

Our catalogue will tell you about several other devices that help make the manager's life more pleasurable. It's yours for the asking.

TYPE A—10-Pair Hall Cable Box.

CABLE TERMINAL EFFICIENCY.

A great deal of the efficiency of a cable plant depends upon the terminal and distribution facilities. And what is more, the type of terminal is of the greatest importance. Some of the points to be considered in its selection are protection, "getatability," compactness, rigidity. Considering these features collectively or individually you cannot find a terminal on the market that is superior to the HALL. Protection was given the greatest attention in its design so that when you buy a

HALL CABLE TERMINAL

you have bought protection against lightning, sneak currents, or crosses with dangerous circuits. The "getatability" of the Hall is unique. When the cover is taken off the top, bottom, front and back are exposed. No opportunity here for faulty inspection.

Compactness? Just look at the illustration. That tells its own story.

Rigidity? An all-metal framework carries the terminal plate. We couldn't make it stronger if we tried.

Seems to us you ought to get prices. Your name and address will bring them, and some more facts that will be of value to you.

NORTH'S Solid Back Transmitter combines ample volume, perfect articulation, deep penetration and natural pitch. It reproduces the voice high or low, loud or soft—a loud voice without breaking or blurring.

The full round volume is attained by entirely eliminating dampening springs; there is no unequal pressure on one side of the diaphragm, which is dish-shaped for confining its action to the path of the voice vibrations.

A small amount of polished granular carbon in a specially formed shallow cell eliminates packing.

All parts are made in jigs and tested accurately to a ten-thousandth part of an inch and there are no accidental transmitters in the product.

Just as a precaution, though, they are tested by an engineer before leaving the factory, under conditions approximating actual service.

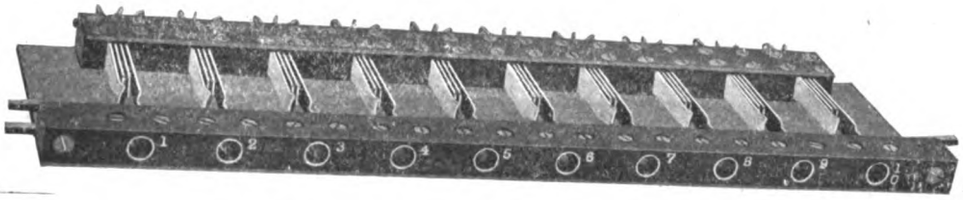
CENTURY
100% GOOD



Poorly Constructed Jacks Will Cause More Trouble and Bad Service Than Any Other Defective Switchboard Parts

Cross talk, noisy connection, "cutting-out," and other troubles that cause subscribers' complaints, and cost money, may all be traced to poor and faulty jacks.

The jacks in our switchboards are perfect mechanically. All parts are accurately made by expensive tools. When these parts are assembled, they fit together as they should, without any strain. The springs are of the proper size and shape. The sleeves are reamed out to the correct diameter to fit the plug. All parts are securely fastened together. This construction assures absolutely perfect connections at all times.

All insulation is of the very best grade of hard rubber—the best insulation for the purpose. The insulation is heavy enough to withstand a very high electro-motive force. This assures perfect service, free from all cross-talk.

Mechanically and electrically, you will find our jacks perfect in every detail.

When you are figuring on a new switchboard, let us show you some of our product. We know we can interest you—and our prices are right.

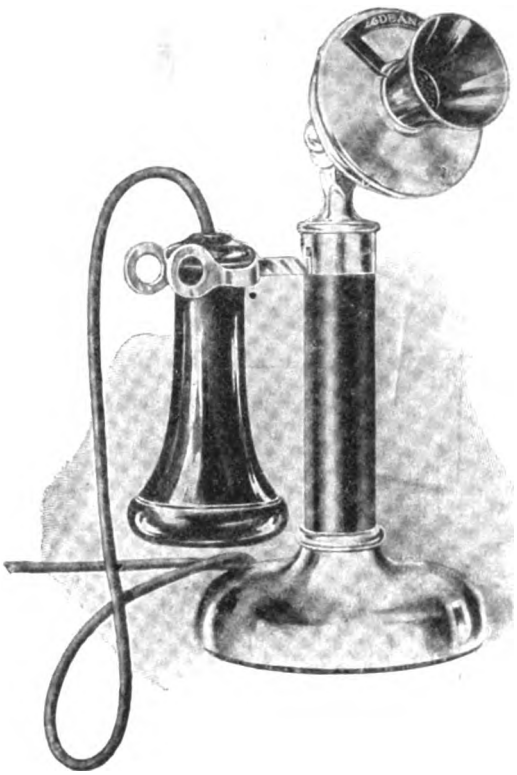
DEAN TELEPHONE APPARATUS

THE DEAN DESK STAND



The above illustration shows our Common Battery and Local Battery Desk Stand. There is nothing unusual about its external design, excepting plain lines with no crevices in which dirt can collect. But its internal mechanism and construction will bear careful study.

The inner framework is made from steel (no castings) rigidly put together.

The hook switch, contact springs, coil and connecting rack are mounted on a removable plate and located in the base—easy to inspect and not liable to get out of order. The wiring is carefully done.

The Common Battery Desk Stand only requires a two-conductor cord for connecting to its bell box.

The talking parts are full size standard Dean product capable of giving the best possible transmission.

The demand for this desk stand has heretofore been greater than our manufacturing capacity, the majority of the instruments having gone to the largest operating companies in this country—one exchange already having nearly 5,000 in operation. We have just greatly enlarged this part of our factory, and can now fill all orders promptly.

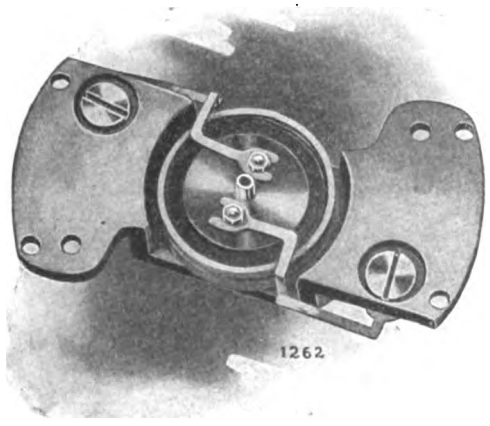
The Stromberg-Carlson Transmitter



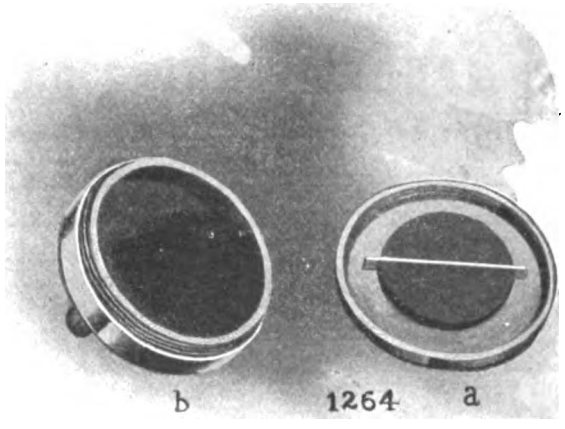
DIAPHRAGM WITH CONNECTORS AND CARBON CUP ATTACHED

Is decidedly different from any other you have ever seen. Different in ways that count for better transmission. This is quite noticeable when the transmitter is used on long distance lines. At a very slight cost you can prove this to your entire satisfaction.

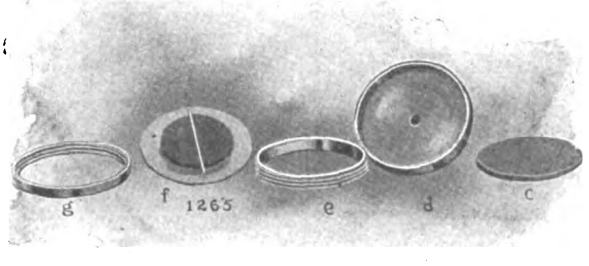
Why not do it?

THE ELECTRODES

Are made of carbon, and both are attached to the central point of the main diaphragm. There is thus produced a variation in the distance between the electrodes of twice the amplitude of variation of the central point of the main diaphragm. It is unnecessary to claim greater volume of transmission than if only one electrode moved.



CARBON CUP WITH CARBON REMOVED



PARTS OF CUP

We give the transmitter such an adjustment that under ordinary tones of voice the volume is not as loud as some of the forms of sensitive transmitters now on the market. As the voice is raised, however, the volume of transmission from the instrument is multiplied two-fold so that the transmission, when talking in a loud tone of voice, has much more volume than that of any other type. The advantage of this is readily seen.

Let us send you our new booklet describing and illustrating this transmitter. It tells the whole story; we mail it free. Just ask for Booklet No. 91-B.

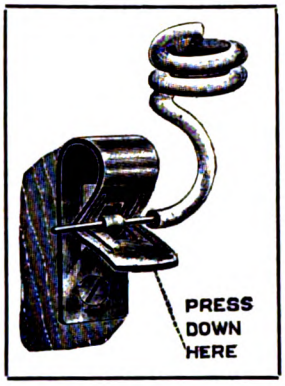
INDISPUTABLE FACTS

Euclid says that a straight line is one which lies evenly between its extreme points. No matter how you try, you can't gainsay that statement because it is a fact.



For the same reason, THE FAHNESTOCK SPRING BINDING POST is the best binding post made. If you have not discovered that fact, it is because you have not tried it. Reasons why it is the best are many. It is simple. Just a piece of brass bent into a special shape to form a spring clamp. It holds securely, because there is just a sufficient amount of tension to enable it to grip the wire tightly. It cannot cut, because the contact surfaces are designed to prevent this trouble. You have been using the old style screw post, and you know its faults. Don't you think it time that you substituted the Fahnestock?

Remember, YOU DON'T HAVE TO PAY A CENT MORE FOR BATTERIES SUPPLIED WITH IT, and you do save all the expense incurred by the faults of the screw post.

When you order your next lot of dry cells, specify FAHNESTOCK SPRING BINDING POST, or if you would like to see one first, *we'll send a sample free.*

Trumbull All Copper Battery Switch

GOING TO BUY

"BABY" KNIFE SWITCHES

Then you must get the Trumbull all-Copper Switch. It is immeasurably superior to any other type for several reasons. Note the shape of the contact springs. The inverted U formation gives greater elasticity and at the same time makes surer contact. No matter how carefully the porcelain bases are fired, some will warp slightly. In the old style switch this causes unequal contact between the blades and the springs and results in uneven wear. The Trumbull method of construction prevents this. Hadn't you better get posted upon switch details before buying. We can surprise you with facts and figures.

The Telephone and the Sleeping Car

How the Traveler Secures a Berth from Any One of Numerous Offices, While the Ticket Agent is Able to Handle His Sales Without Large Reservations of Empty Space

By Robert G. White.

EXAMINE any business that you like, you will perhaps be surprised to find how dependent it is upon telephonic communication for its success. In railroad operation the telegraph has for a long time been the principal space and time annihilator, but the simplicity and flexibility of the telephone is rapidly being appreciated, and ere long it will have almost superseded the older scheme of communication. Of the manifold intricacies of this business there are few with which the general public is brought in contact, and of these, there is at least one which relies almost entirely upon the telephone for its association with the traveller.

The exigencies of modern commerce make it imperative that the business man shall spend as little as possible of his working hours away from a point where he can be readily reached by telephone, telegraph or messenger. For this reason railroad journeys of any length are always taken at a time when the major portion of the ride will occur after office hours. If the trip necessitates the spending of a night on the train, a berth or stateroom in a sleeping car is required. It is in the reservation of these accommodations that the telephone becomes almost indispensible, not only from the standpoint of the prospective passenger as a time saver, but also on the part of the railroad company, which has incorporated it in the system employed for the sale of these tickets.

Branch Ticket Office of the New York Central and Hudson River Railroad. Pullman reservations are made from this office by telephone.

All long distance trains, and many others which travel between important points, carry one or more Pullman cars. As the seating capacity in these cars is limited, it is generally necessary that the traveller shall secure his reservation in advance. This he must do by calling at the station, or if he resides in a large city, at the most convenient agency. To thoroughly understand the method of procedure a concrete example will be given in the case of a prospective passenger from New York to Chicago over the lines of the New York Central and Lake Shore Railroads.

In New York City the company maintains twelve branch offices for the sale of tickets besides the regular bureau in the Grand Central Station. Each office is supplied with the necessary railroad tickets and carries a supply of numbered Pullman checks. Each branch office is bridged on a special line, which terminates at the Pullman division in the Grand Central Station.

Here there are a series of pigeon holes, each containing diagrammatic charts of the different cars attached to every train for every day of the week. Each card is provided at the upper left hand corner with a ruled space in which the following information is placed: Car number, line, train number, time train leaves, terminal points and date. The lower portion of the card is a diagram of the berths; one side for upper, the other for lower. If staterooms are included these are noted at the foot. These cards are made up two months in advance, and it is not uncommon for a party having a journey on a certain date to reserve space early enough to be sure of getting the desired location. Talking with Mr. Lahm, the ticket agent at the Grand Central station, the writer was informed that the calls for upper berths were so rare as to be noteworthy. Since these form one-half of the capacity of the car, it will be apparent that an early reservation is important if one wants a lower berth.

Should the prospective passenger desire to ride on the Lake Shore limited, he can call up the nearest city agency and inform the officials of the desired accommodations. The clerk then calls

Digitized by Google

the main office and finds out if such a space is available. If it is, the party calling is so informed and told it will be held for one hour, to give him time to get to the office and make the payment. At the same time his name is inserted in the space corresponding to the berth or stateroom he will occupy. At the time the tickets are bought the attendant again calls up the main office and gives the serial number of the Pullman check. This is then entered on the chart in the place of the passenger's name, and the car number and berth number and location are telephoned back. This information is then written on each of the four sections of the Pullman check, two of these being given to the passenger, together with his regular railroad ticket, and the other two are retained by the agent. Just before the train leaves a record is made of all the unoccupied berths or staterooms and this is telegraphed to the agent at the next stopping place, who is thus informed of the accommodations at his disposal for passengers from that point. After the train leaves, he repeats this operation and in this way an exact record is on hand at every office before the arrival of the train of the spare seats or berths.

Parlor Car Bureau of the New York, New Haven and Hartford Railroad, Grand Central Station, New York. Pigeon holes contain charts for parlor cars for every day in the week.

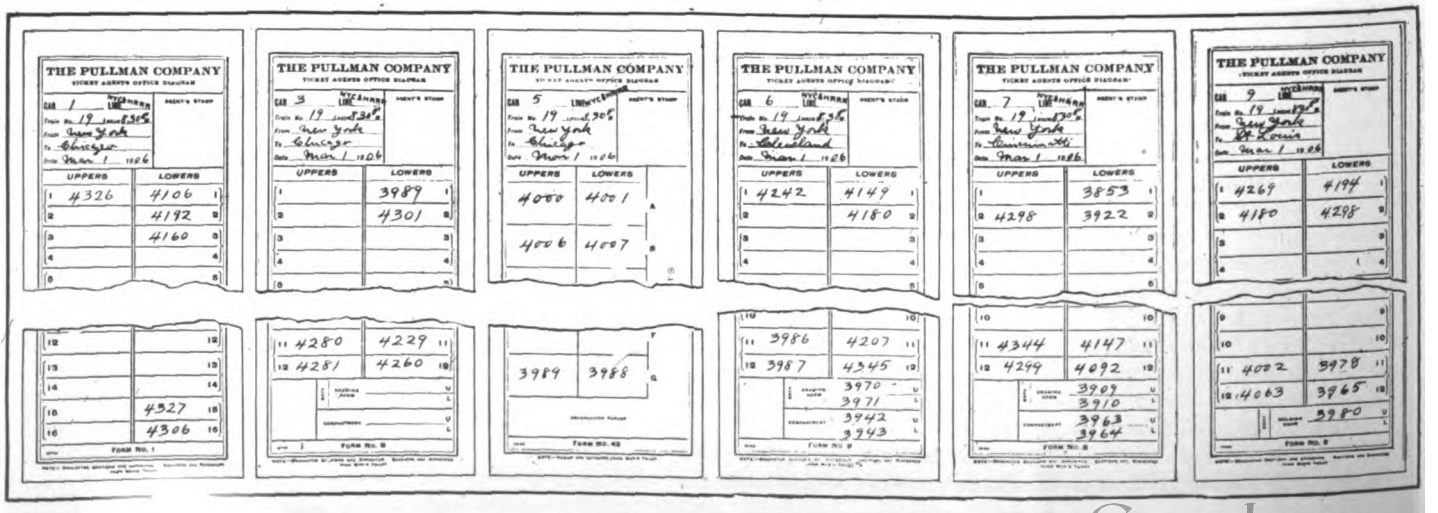
At intermediate points along the line, where the traffic is heavy enough, ticket agents are given reserved space for their disposal so that a passenger does not have to wait till the last minute to purchase his Pullman reservation. Before the train leaves the terminal station all the charts are given to the Pullman conductor and he uses them to check off the passengers. Upon the arrival of the train at its destination these checks are turned in to the company to be kept as a record.

The New York Central Railroad runs each day twenty-four trains to which are attached Pullman cars. Of these the Twentieth Century Limited has accommodations for sixty-two passengers, there being only three cars. So great is the traffic, however, that it rarely carries less than seventy-five per cent. of its passenger capacity. Over fifty per cent. of the berths on this and the other trains is contracted for by telephone. In round numbers an average of three hundred calls are received daily at the Grand Central Station over the official and exchange wires for information and sale of Pullman reservations. These calls come from every part of New York City and Brooklyn, and as the station is approximately in the centre of population it will be readily understood how absolutely necessary the telephone is. Out of town parties can reserve space by telephone and have it held till within ten minutes of the departure of the train, thus giving them equal facilities with the city passenger.

The New York, New Haven and Hartford Railroad operates its own parlor and sleeping car system, but the method of reservation is similar. A bureau devoted exclusively to this work is situated in the general passenger agent's office and shares the same room with the telephone exchange. Here a young lady is in charge who attends to all the details of the sales which emanate from the ticket office in the station or at the branch offices. The trains of this company while not traveling as long distances as those of the New York Central, have in comparison an equally heavy parlor car traffic. In this case, however, the sale of every ticket depends upon the use of the telephone. For this reason the number of calls received per day is equally as large as that of the New York Central bureau.

It may be interesting to note that the telephone has been used by the New York Central road for over fifteen years in the sale of Pullman tickets. This use dates back to a time when this traffic was not one-fourth of what it is at the present time.

Charts of all Pullman Cars on the Lake Shore Limited, Showing the Method of Inserting Numbers.



Digitized by Google

The utilization of the telephone for Pullman car reservation many well be considered to have been the entering wedge for its ultimate adoption as the principal scheme of communication in railroad operation. That it will eventually supplant the telegraph is now a safe prediction. Many of the most important railroads either have extensive telephone service, or are at present engaged in installing it. Just which line was a pioneer in this direction is uncertain, but for years the two railroads previously mentioned in this article have had very comprehensive systems, which, although not used for the actual dispatch of trains, have, nevertheless, proved of inestimable benefit in the transaction of those portions of the business closely allied with the commercial departments of railroad organization.

Besides greatly assisting in the internal affairs of a railroad, the telephone is of much value in the interchange of business with its customers. Every railroad is anxious to secure as much business as possible. When two competing roads cover the same territory keen rivalry exists, and it is safe to say that if one line has adequate telephone connections, it will, by being able to place its agents in immediate and direct communication with the public, secure a larger proportion of the business than the other, which is not so well equipped. It is, therefore, of the greatest importance that the telephone system shall not be a purely local affair, but available for use in the most comprehensive manner for the public service. By this plan the farmer, manufacturer, wholesaler, etc., can talk directly with the official desired, and not be subjected to delays which would otherwise occur.

Sleeping Car Atlantic No 3 to Chicago

State-room Car Marseilles No 3 to Chicago

John Jones Ticket Agent, Grand Central Station.

Telegraph Form to be Filled in With Information Sent on Ahead of the Train to the Next Stopping Point, to Show Available Space up to Time of Train's Arrival.

The benefits which can be derived from the use of the telephone are well illustrated in the reservation of sleeping car space, but this is only a very small item when the possibility of a comprehensive telephone system are considered, which will not only facilitate the internal business of the road, but also bind it into closer relationship with the public, from which it derives its support.

This has been an important result of the use of the system described in this article. The sleeping car, while it contributes greatly to the relief of the monotony which is usually felt on a long journey, is especially valuable as a time saver. The railroad companies, by the use of many ticket offices, located in the business districts of large cities in such a manner as to completely satisfy the demands of the public for quick service, has reduced the loss of time to the lowest terms. This has been made possible only by the use of the telephone.

Increased Cost of Telephone Service

ORDINARILY, the greater the number of patrons, the cheaper per unit can a public service corporation furnish service to its patrons. With the telephone, however, the rule reverses, and with an increasing list of subscribers the cost per unit for exchange telephone service increases. The reason of this is stated in the bulletin of the Indiana Independent Telephone Association to be due to three conditions, or factors:

First: *Cost of Operating.* The larger the exchange, the greater the value of the service to the individual subscriber on account of the greater number of persons with whom he is placed in telephonic relations. This is not true of other public service, such as gas or water. The service of a gas or water company with 500 patrons is worth just as much to the individual patron as a plant with 5,000. In fact, because of certain difficulties, such as purity and pressure, in furnishing these commodities in large quantities, the service of the smaller plant is often worth more to the individual patron than that of the larger. The value of the service of a telephone system increases, however, in direct proportion to the increase of subscribers, and with this increase in value to the individual patron comes a consequent increase, at a greater ratio, in operating expense. An operator can only answer a certain number of calls, whether in a large or small exchange. Estimating this number at 500 per day, in an exchange of 500 subscribers, and estimating that each subscriber uses his telephone four times a day, four operators will be required. Estimating that an exchange ten times as large, i. e., one of 5,000 subscribers, is worth, to the individual subscriber, twice that of one with 500 subscribers, he will then use his telephone an average of eight times per day, making a total of 40,000 calls daily, which will require eighty operators, each answering 500 calls per day. In the exchange of 500 lines, one operator is required for every 125 subscribers, while in an exchange of 5,000 lines one operator is required for every 62½ subscribers, which doubles the expense of operating per unit line. Theory and experience agree on the above ratios.

Leaving out of consideration all other factors, the following rule on operating has been found true by all exchange managers: *The cost of operating for each telephone in any system increases directly as the value of the service to the individual subscriber increases.*

Second: *Cost of Installation.* Telephone service is individualized. Each subscriber added to an exchange system that gives independent metallic service must have a *separate pair of wires* from his telephone to the answering jack on the switchboard. A gas or water company lays its main in the street—*one main for all residences along the street.* When additional patrons want service, the gas or water company only has to lay a service pipe from the main to the property line, and not from the patron's residence to the central power plant a mile or two distant. The gas and water in the mains is common property for the patrons, and one cubic foot of gas or water will answer the patron just as well as another. Not so with telephone service. Conversations must be individualized. One message will not answer the patron as well as another. Hence service wires must extend from each subscriber's telephone, not to the nearest pole line or cable, but all the way to the exchange. This means that aerial pole lines, heavy enough to take care of an exchange with a certain list of sub-

Digitized by Google

scribers, become too small and inadequate when that list increases, causing a consequent increase of wires. The lighter pole line must then be replaced by a heavier one. With the doubling of the subscribers' list, the heavier pole line becomes inadequate, and must be replaced with underground conduits and cables, which are much more expensive than light aerial leads.

The cost of switchboards increases for each unit with the addition of subscribers. A 500-line capacity board will cost, installed, about $5 per line. To add another 100-line section will cost no more per line than the first 500. But to add a hundred additional lines section to a 5,000 multiple board already filled, will cost approximately $50 per line. The unit equipment in a switchboard for subscriber No. 5001 costs ten times that for subscriber No. 601, and telephone engineers have never found the point where the cost per unit does not greatly increase with added capacity.

The question is asked, why does the telephone company not install underground conduits and multiple boards at the start? The answer is at hand. Because a prospective patron is unwilling to pay conduit-constructed, multiple-switchboard prices for service in an exchange of only a few hundred subscribers where such installation is not necessary.

Third: *Increase of General Expense.* Independent telephone companies have not hesitated to accept a maximum limit rate in their franchise. They have aimed to be open and fair with the people whom they served. A vast majority of these franchises were obtained when not only the commodities of life were lower than now, but also when almost all material entering into the general construction was much cheaper. Wages are constantly increasing in all lines of business. The telephone has come to be a business and social necessity. Service that was eminently satisfactory five years ago would not be tolerated by the patron to-day. With this demand for better and dependable service, the telephone company has been compelled to substitute skilled for unskilled help at greatly increased cost. The advent of traction lines, lighting and power systems, on account of inductive disturbances, has compelled telephone companies to substitute individual metallic circuits for grounded and common return systems, which doubles the amount of copper or iron necessary to install a subscriber's line.

With a list of subscribers three and four times as large as that anticipated at the time an exchange was installed, with a service much better and many times as extensive as that promised or contracted for, with the greatly added cost of operation and installation per unit line, due to conditions which no one foresaw and over which the company has no control, it is not unreasonable that telephone companies should have an additional rental per unit line, providing the rate charged under former conditions was reasonable and equitable for the amount and class of service furnished.

Economical Telephone Accounting and Filing Systems

ARTICLE III.—BRANCH EXCHANGE REPORTS, CONTINUED.

*By Charles C. Wilmot, Telephone Accountant.

This article and all forms reproduced have been protected by individual copyrights.

Copyright, 1906, by The American Telephone Journal Company. All rights reserved.

THE forms illustrated and explained in this article were designed and put into actual service in January, 1905, and have stood the practical test of use since that time in many exchanges. A careful comparison of these forms with the very complete report of the Special Tariff Committee of the New York Independent Telephone Association (published in The American Telephone Journal, issue of July 1, 1905) will show with this article.

The "Monthly Toll Report," form No. G-65, is made up from totals shown on form No. G-89. A careful study of the printed headings on this form, makes it self-explanatory. The form is not made in duplicate, but printed in copying ink so that a letter press copy can be taken if desired. Letters A-B-C, etc., on the monthly statement shown on the back of form can be used as a

that all the necessary details therein mentioned are fully provided for. A reprint or copy of the above report should be posted in the office and operating room of every telephone exchange in the country, and the report should be read carefully in connection reference in correspondence, e. g., "Your item A, or R, etc., is not correct, etc."

The printed part of this form (in duplicate) is 10¾x9¼ inches when folded, ready to insert the carbon sheet. In a large system using a great many of these reports, the back of the original portion of this form should be "carbonized," doing away with loose

*Editor's Note: Mr. Wilmot is manager of the Telephone Systems Department of the Edwards & Hine Company, Grand Rapids, Mich.

Digitized by Google

carbon sheets. The form is arranged with a stub, punched for a loose leaf binder, and is to be inserted between tabbed index sheets. With this arrangement they may be quickly and easily referred to for the current month's work. For large exchanges we recommend the vertical system of filing between tabbed guide cards, both for the current month sheets, as also for their permanent system of filing. For exchanges not caring for the duplicate carbon copy the form can be printed flat, three forms on a sheet, put up in perforated pads. Paper stock used should be of a tough but inexpensive quality. A separate duplicate set of toll ledger sheets (Form G-89) must be used for each station with which the reporting station does business, a line being given for each day of the month.

In the "Monthly check report, or Check Ledger," form No. G-89, it is necessary to fill in the blank spaces at the top of each sheet with the name of the originating exchange or station, and the name of the exchange or station from which toll messages have been received or to which messages have been sent. Spaces are provided for the amounts of the day and night rates and the routing of messages. This information is very necessary to a state traffic or clearing house association which handles the interchange business for the state.

The first column must show how many messages were day and how many were night. The second column must show overtime minutes for both day and night messages separately. Great care should be taken in placing all amounts in their proper columns.

In the columns headed "Out messages" and "Toll sent paid" are to be shown the total amounts of all messages paid for at the station making out the report. The "Tolls sent collect" column is provided for the total amounts of all the reversed messages, charges for which are to be collected at the station to which the messages are sent. The amounts in the "Messenger fees collected" column show the total amount charged for messenger service on originating business. The first four columns headed "In messages" are to be used in the same manner as those for "Out messages." In the column headed "Toll received paid" is to be entered the total amount of all messages received but paid for at the forwarding station, while the "Tolls received collect" column is for the total amount of all reversed messages for which payment has been collected at the station at which the report is made out. The total amount of fees earned in getting patrons

OFFICIAL BULLETIN NUMBER EIGHT OF THE NATIONAL-INTERSTATE TELEPHONE ASSOCIATION.

MAPS:

We have begun toll line maps for Nebraska, Kansas, Kentucky and Minnesota, making thirteen States to date for which maps are being prepared.

If you have not already done so—please SEND US THAT MAP OF YOUR LINES.

COMMITTEES:

The following Committees have been appointed. Communications in regard to the work they will take up are invited and can be sent addressed to the Chairmen of the respective committees in care of this office.

Standard Forms of Accounting: Chas. F. Bender, Chairman, Pittsburg, Pa.; C. J. Myers, Kansas City, Mo.; Geo. T. Hewes, Des Moines, Ia.; R. E. Mattison, Lincoln, Neb.; H. W. Spooner, Minneapolis, Minn. Standardization of Equipment: M. H. Clapp, Chairman, St. Louis, Mo.; W. C. Polk, Birmingham, Ala.; Edmund Land, Grand Rapids, Mich.; O. F. French, Cleveland, Ohio; J. W. Kelly, Jr., Philadelphia, Pa. Standard Operating Rules and Regulations: J. B. Casey, Chairman, St. Louis, Mo.; W. C. Handlan, Wheeling, W. Va.; L. R. Herrick, Freeport, Ill.

STATISTICS WANTED:

We should like to hear from the companies operating rural telephone systems in regard to the increased value of real estate in country districts due to the introduction of the telephone. It is a commonly recognized fact that such increase in value invariably follows the completion of rural telephone lines, and we think the compilation and publication of statistics with reference to this will be of interest and value to all Independent operators.

SUPPLY DEPARTMENT:

Judged by results, the Independent telephone people appreciate the efforts of this department to thoroughly introduce the "Official Shield." Just now we are making a special endeavor to have all independent companies, who are not at present doing so, display the standard toll sign at exchanges and toll stations. Will you co-operate by seeing that your company gives us the proper amount of support? An illustrated catalog will be sent on request.

KEYSTONE COMPANY OF PHILADELPHIA AIDS REVIVALISTS.

IN Philadelphia great interest is being aroused by the work of the revivalists Torrey and Alexander. Thousands have found it impossible to crowd into the armory to hear the services. Having come from far and near to hear the revival leaders, they were not at all satisfied with the inducements made them to attend meetings in nearby churches where the preaching and singing were conducted by local mission workers. The Keystone Company has arranged to solve the difficulty by the transmission over its wires of the proceedings at the Armory. When Dr. Torrey speaks and Mr. Alexander's choir of 600 sings they may be heard by every subscriber to the system of the Keystone Telephone Company.

Connections have been made with the telephone company's hospital outfits for an extension of the service to the beds of the sick, and in many of these institutions the revival spirit will cheer the suffering. All who desire to take advantage of the unique arrangements have only to ask for telephone connection with the Armory.

The system was installed under the supervision of John W. Kelly, Jr., who has secured most successful results.

SEWARD COUNTY, NEBRASKA, SERVED BY RAPIDLY GROWING INDEPENDENT COMPANY.

SINCE the two companies originally organized to give independent telephone service in Seward County, Neb., were consolidated under the name of the Seward County Telephone Company it has to-day the entire south and west part of the county covered with its wires. A splendid exchange has been erected in Seward, and the company is now reaching out for business in all directions. It has recently gone into Germantown, and a large number of patrons have been secured there and in the surrounding country. An Independent line has been built in the northwest part of the county with headquarters at Staplehurst, and while it has a separate organization from the Seward County company, they are both connected with the Seward exchange and a patron of one in any part of the county can talk with a patron of the other. The total number of telephones now in use is 1,083, while orders have been taken for 116 more, which will be installed as soon as possible. These will carry the total number up to 1,199. The exchange at Seward has been in operation a little over six months, and the total number of subscribers is 198. Two farm lines are being built out of Seward, and others are likely to be constructed within a short time. Seven exchanges are maintained in the county at the present time, including the one at Seward, the others being at Staplehurst, Tamora, Beaver Crossing, Utica, Germantown and Milford.

The company is capitalized at $50,000, and at the close of the past year $28,650 of the stock had been sold. Since then, however, the amount sold has been increased to nearly $40,000. Every share of stock is owned by Seward county people or people living across the line in other counties but who are patrons of the system. According to the annual statement published the first of the year the company has invested in lines constructed over the county and supplies the sum of $32,779.70, and in addition thereto the Seward plant is carried at $12,593.62, which is the amount it cost. Last year the company earned dividends on the capital stock to the amount of 16 per cent., of which 4 per cent. was placed in the maintenance fund, and 12 per cent. paid to the stockholders. The following are the officers of the company, all of whom reside at Beaver Crossing:

President, Jacob Geis; vice-president, J. P. Mayhew; secretary, J. H. Ritchie; treasurer, L. G. Gake. The board of directors is composed as follows: E. H. Strayer, Milford; O. D. Thygeson, Utica, and J. J. Thomas, Seward.

INDIANA INDEPENDENTS BLOCK MOVEMENT OF THE BELL BY REFUSING SERVICE TO TOWNS CONNECTED WITH BELL LINES.

THE Independent Telephone Companies of Northern Indiana have successfully blocked a move made by the Bell Company to establish sublicense toll stations through independent exchanges. The step was taken during the past week in Ligonier, Leesburg, Milford and other towns in Northern Indiana. The Independent Companies ordered the Bell connection cut off. The order was emphasized by a declaration that refusal would mean that the Independent Companies would cease to give the towns service. It is stated that the connections have been cut. It is quite certain that the sublicense plan of the Bell Company will be effectively headed off in Indiana through this movement.

QUERIES

CABLING LAYOUT.—(661.)

Will you kindly explain the method of arranging cabling for a standard Bell line circuit? R. Z.

A standard Bell line circuit employs an answering jack associated with calling in lamps at one part of the switchboard, and the line is also connected to the multiple jacks located in the upper part of the switchboard sections. The line signal is operated by relays, which are located upon the relay rack.

The line enters from the outside of the building through the cable, and is connected to terminals upon the main distributing frame. Two types of standard frame are used. In one type the outside cable is connected to the arresters, mounted vertically upon one side of the frame, and the line passes through heat coils in these arresters, and from the inner terminals cross wiring in twisted pairs is extended to terminals on the horizontal side. From these terminals the line is continued through a cable made up of twenty twisted pairs of wires, which extends to the horizontal side of the intermediate distributing frame. In the main frame of the other class the cables from the outside are terminated upon strips on the horizontal side of the frame, from which cross wiring extends to the arresters. The cable to the intermediate distributing frame is connected to the other terminals of the arresters, the line passing through the heat coils as before.

At the intermediate distributing frame on the horizontal side are provided terminal strips containing twenty sets of three punchings each. Two of the punchings of each set are connected to a pair of wires in the cable from the main distributing frame. It will be seen that one entire terminal strip, therefore, corresponds to a single cable from the main frame. From the two line terminals each pair of wires is extended in another cable to the multiple jacks on the switchboard. These cables are made up of twenty pairs and twenty single wires, the pairs being connected to the tip and ring of each jack, and the single wires connected to the sleeve of each jack, and the third terminal of each set as referred to above. It will thus be seen that upon the horizontal side the terminal strips have connected to them two sets of cables, those from the main frame and those to the multiples, both of which are arranged to run to the lower halves of the blocks. The punchings extend through the blocks, and from the top cross wiring is run to the terminal strips which

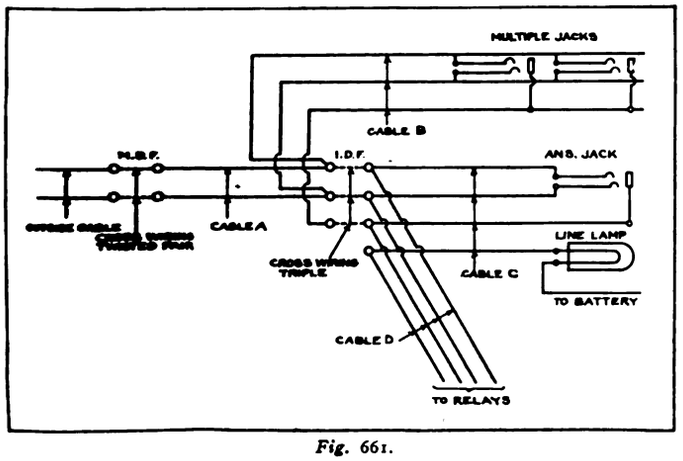

Fig. 661.

are mounted upon the vertical side of the frame. Three wires twisted up together are used for each line. Each block on the vertical side is provided with 20 sets of four terminals each. Three of the terminals are for the tip, ring and sleeve connections of the answering jack, and the fourth is for the line lamp. One cable, containing 40 pairs of wires, is run from each terminal strip to the switchboard, where it is divided in the answering jack space, taking two strips of answering jacks and the two associated strips of line lamps. The line lamp wire receives positive battery through a contact of the line relay, and the cir-

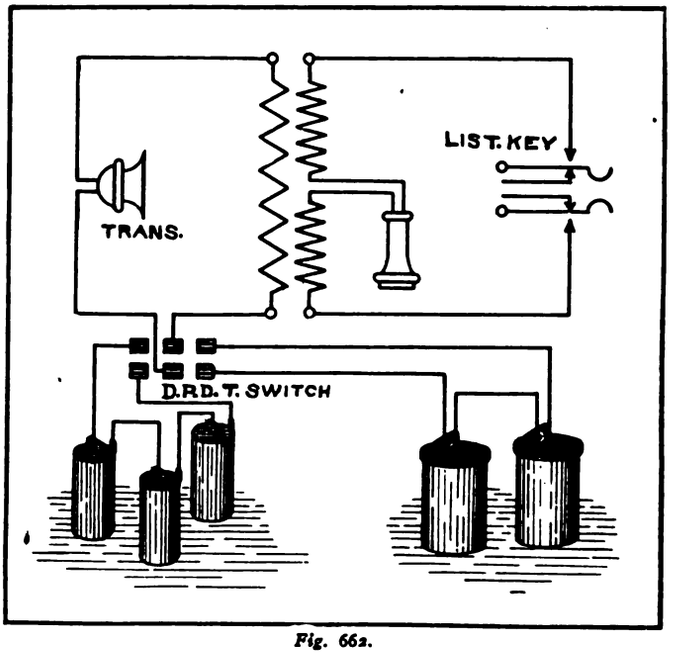

Fig. 662.

cuit through the lamp to negative battery is completed by means of a common wire run directly to the lamps in the switchboard from the fuse board.

The relay rack, which is usually set parallel to and immediately opposite the vertical side of the intermediate distributing frame, has mounted upon it one relay for each answering jack. These are connected to the line circuit at the terminal blocks on the vertical side of the frame by means of a cable made up of 40 twisted pairs of wires, there being four wires for each line.

In Fig. 661 this arrangement, as carried out for a single line, is shown diagrammatically. The cables A, B, C and D are used to carry the line from the main frame to the intermediate frame, intermediate to multiple jacks, vertical side of the intermediate frame to answering jacks and the vertical side of the frame to relays, respectively.

AUXILIARY BATTERIES.—(662.)

We have a small exchange located at some distance from headquarters and sometimes we are troubled by the batteries giving poor service when it is inconvenient to send a man to change them. Can you tell us of any method by which the operator can tell when the batteries are nearly exhausted, in order that we may avoid having the service give out at unexpected times? L. F.

A battery gauge of some good type may be used to determine the condition of the cells from time to time. This, however, is not a sure protection, and we would suggest that you have two sets of batteries, so arranged that either may be used upon the operator's transmitter circuit. This can be readily brought about by carrying the battery wires from the primary circuit of the operator's set to the middle points of a double pole, double throw, baby knife switch. The regular set of batteries may then be wired to one pair of terminals, and the opposite pair should be connected to three dry cells wired in series. Whenever the wet batteries give out, the operator may cut in the others by simply throwing the switch, and the defective batteries may be renewed when it is convenient for the inspector to visit the station.

THE EDITOR'S PAGE

PROPERTY VALUES AND THE RURAL TELEPHONE.

THE eighth bulletin of the National-Interstate Telephone Association contains a request for statistics showing the effect of rural telephone lines upon the value of real estate. It is well known that this effect has been to greatly increase the worth of the land located outside of local centres of population.

With the exception of methods of increasing productiveness, there is nothing which will operate so quickly to raise the value of property in a rural community as the establishment of additional facilities for communication. For a long time it was an axiom that prosperity followed the railroad. With the introduction of electric lines, also, the prosperity of the country surrounding these systems was immensely increased.

The extra value which has been thus added to the property is due, in a large measure, to the increased ease with which residents may learn the condition of the market. The industry of these communities, to a large extent, consists in the raising of food products, which are especially subject to fluctuations in price. On account of their perishable nature and bulk, they cannot be retained at distributing centres to await a favorable opportunity to sell, and, in order to obtain the best prices their producers must get their wares into the market and sell them immediately after the fact of a temporary rise in value is learned.

With proper methods of transportation a farmer can visit the nearest local market frequently and learn within a short time of any change in conditions which it is to his advantage to know. The telephone, however, enables him to be informed of a special demand instantly, and it only remains for him to get his goods transported, and thus more than half the time required to dispose of his goods is saved.

In addition to the direct money gain which comes from the advantage in selling the property, there is usually a distinct saving possible in the buying of goods. Purchases may be made over the telephone line, and time which would be lost in a visit to the place where the goods are bought can be profitably expended at home in directing operations that will be more productive.

There is no industry which is more dependent for success upon the earliest knowledge of weather changes than that of agriculture. The rural line enables the farmer to receive the earliest reports of probable changes. In fact, a regular weather service is frequently given by warning the subscribers by a special ring at a pre-determined hour of the day, and reading the weather forecast to all who come in on the line and listen. This service very often enables a saving from frost and other disastrous conditions to be made, which vastly increases the total value of harvests in certain regions.

In addition to these things, which have a direct effect upon money values, the telephone contributes to the greatest extent to the features which make life in isolated regions less lonely. In the evening the telephone line is frequently used for social diversions which bring whole communities together, and its value in this respect cannot be overestimated.

As a means of insurance against sudden danger, as has been shown in instances where it has quickly called members of a scattered community together to extinguish fires, it again operates directly to save property, and so adds to the accumulated wealth of the people whom it serves.

While the general effect of a rural telephone system in increasing values of property may be rather widely recognized, it is very important that statistics should be at hand which will give definite information. The use of these statistics will obviously enable telephone managers to use a very powerful argument when endeavoring to secure additional subscribers to such systems. The benefit to the people offered by the presence of the line should be a useful argument in securing rights of way when there is a tendency to oppose these, or charge for them at excessive prices. In financing a company such figures as the National-Interstate Asociation proposes to gather should furnish very good arguments to present to prospective stockholders in the region to be tapped by the system. Definite figures, from known sources, are in all cases much more reliable and more convincing than estimates.

The work of gathering these figures is so great a task that it can only be successfully undertaken by a body able to collect from all available sources. The development of the rural systems has received a good start, and every effort should be made to push it forward as rapidly as possible. The plan under discussion offers to every telephone manager an opportunity to aid this movement materially, and, incidentally, to increase his knowledge of local affairs in a way that will be directly and immediately beneficial to himself. It is to be hoped that no time will be lost in giving all possible assistance to this undertaking.

THE TELEPHONE AND THE RAILROAD.

THE way in which modern methods of communication fit together to form a system adapted to serve the public interests to the fullest possible extent is very clearly illustrated by the special uses of the telephone service which have been adopted by the railroads. As described in another part of this issue, a traveler takes the first step in the accomplishment of a journey by the use of the telephone. From the time he reaches the station he is using a system in which the telephone contributes in almost innumerable ways to aid him to reach his destination quickly and safely.

It goes without saying that a large part of the administration of a railroad system is done over telephone lines, as is the case with any other business. More recently the use of the instrument has been widely extended to take in many classes of information used in the handling of trains, which have been previously transmitted by telegraph. It has been found that the telephone is thoroughly reliable, and possesses the immense advantage which comes from the fact that the atendance of a specially trained person is not required. If an office is called, it is not necessary that the regular operator should be present; anyone who is there may take the message.

The service is being even further extended so that a train on a siding, or even one delayed between two stations, may attach an instrument to the wires running alongside the track, and communicate with headquarters. In this manner all danger resulting from uncertainty may be eliminated. A conductor may speak to the dispatcher's office at any time.

The usefulness of affording these facilities for direct communication between trains and offices has proved to be so great that the system is being extended rapidly to almost all the railways in the country. In many minor ways this system of communication is used to secure more complete and efficient control of the traffic. On at least one railroad experiments are even being made with instruments for the connection of the engine driver's cab with the cars of the train, in order that the conductor may carry on a conversation with the engineer.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

REVERSAL OF ORDER DISSOLVING TEMPORARY INJUNCTION SECURED BY THE VILLAGE OF CARTHAGE, N. Y.

THE following letter has been received giving additional information about the temporary injunction secured by the village of Carthage against the Central New York Telephone & Telegraph Company restraining the defendant from setting poles in the village and attaching to any pole set since January 1, last, any cross arms or wires. We are grateful for the information.

Under your items on page 61 in the issue of THE AMERICAN TELEPHONE JOURNAL dated Jan. 27, I note an item relating to the case of the village of Carthage against the Central New York Telephone and Telegraph Company, and for your information I beg to say that this injunction was dissolved by Judge Andrews on Nov. 10, 1905. The case was appealed by the village of Carthage to the Supreme Court, Fourth Appellate Division, and Judge Andrews' decision was reversed, which restored the injunction, and the case will now be tried upon its merits. This decision of the Supreme Court was made Jan. 9. The decision of Justice Andrews in dissolving the injunction was a great surprise to the legal profession in this vicinity, and it did not take the Supreme Court long to restore the injunction.

The circumstances of the case were that the local or Independent company had just completed over-head construction one year ago, the local telephone company occupying one side of the streets and the Electric Light Company the opposite side. The village did not care to have a third set of poles, and as the Independent company had a franchise and the Bell company did not, they asked the Bell company to place its wires in conduits in the principal streets. This they refused to do, on the ground that the Independent company had not been required to do the same thing. The village did not see its way clear to ask the Independent company to reconstruct its system, after it had just been completed; therefore, they insisted that the Bell company should put wires in conduits.

At the time the franchise was applied for by the Bell company it had very few telephones in the village of Carthage, probably not more than twelve or fifteen, while the Independent company had over three hundred and furnished most of the business. It remains now to be seen whether the village has any right to say whether the Bell system shall be constructed underground, or a third set of poles be placed in the streets. In the meantime the injunction is in effect.

INDEPENDENTS WIN INFRINGEMENT SUIT INVOLVING SCRIBNER AND McBERTY PATENTS.

IN the case of the Western Electric Company against the Rochester (N. Y.) Telephone Company and others, the United States Circuit Court of Appeals for the Second Circuit has affirmed the decision of the court below in favor of the defendants. The Scribner and McBerty patent, on which suit was brought, was considered one of the most valuable owned by the Bell interests, and the Independents are correspondingly elated. While the defendant was the Rochester Telephone Company, it was well known that the Stromberg-Carlson Telephone Manufacturing Company maintained the defense.

The case came to the Court of Appeals from a decree of the Circuit Court for the Western district of New York, dismissing a bill of complaint in a suit in equity for alleged infringement of United States patent 559,411, granted May 5, 1896, to complainant as assignee of Charles E. Scribner and Frank R. McBerty for "improvements in apparatus for telephone switchboard." The opinion of the Circuit Court is reported in 132 F., 814.

The court said that while it did not find in any single prior patent a distinct anticipation, it fully concurred in the conclusion of the lower court that the device of the patent "was a mere improvement without involving the exercise of inventive faculty." The court further said that there was a wide difference and an extended controversy between the experts for the respective sides as to opinions, theories and deductions, but that as to the facts which establish the prior art, there is really no conflict, nor indeed, any ground for conflict since they were set forth in the earlier patents which were put in evidence. At the close of the record one of the patentees finally stated the improvement of the patent to be the devising of a "system of supervisory signals in which the interruption of the talking current in the line circuit is caused to apply the current or power for displaying the positive supervisory signal, which current or power is later withdrawn when the plug is withdrawn from the jack, permitting the signal to disappear." This "system," said the court, is brought about by a rearrangement of old parts, and in the literature of the art, these parts had already been brought together in such a variety of ways, and there have been so many substitutions of one device for another, so many methods shown of controlling one current by another and of displaying and obscuring signals, such a transposition of parts and shifting of currents, that it seemed entirely clear that the rearrangement of the patentees, clever though it may have been, and in its details perhaps novel, was nevertheless one of thosse minor improvements which was easily within the ordinary skill of the telephone engineer. The court added: "If the expert who is called to testify in such cases would only appreciate that he is not addressing electrical engineers, but laymen; and if, when undertaking to describe what some particular patent showed to a man skilled in the art, he would take the specifications and drawings of the patent as his text instead of some conventional paraphrases of his own devising with its lettering entirely changed, he would materially lighten the labors of the court." To be reported in Federal Reporter.

FURNISHING MARKET QUOTATIONS.

ON the relation of the Hammond Elevator Company, the State of Indiana applied for a writ of mandamus against the Western Union Telegraph Company to compel it to sell and deliver to relator the continuous market quotations of the Chicago Board of Trade. From a judgment granting the application, the telegraph company appealed and judgment was reversed by the Supreme Court of Indiana. The court held that where a telegraph company, in the exercise of its charter rights and in connection with its other business, has been engaged in buying continuous quotations of prices of products of the board of trade, and selling the same at a fixed price to such persons as desired them, for such a length of time as to make such quotations necessary to the successful conduct of business in such products, the quotations and the system of supplying them have become impressed with the public interest, so that, so long as the company continues in such business, it must supply those desiring the quotations on equal terms. The answer of the company alleged that the relator was, at the institution of the suit, engaged in prolonging such quotations and using them in conducting a bucket shop and that relator desired the quotations for the purpose of a bucket shop. This answer was held a good defense to the application for mandamus. The telegraph company had agreed with the board of trade not to deliver the market quotations to the board unless the applicant would agree not to use them for the purpose of conducting a bucket shop. The relator would not so agree and this was held a good defense. Western Union Telegraph Company v. State 76 N. E.; 100.

IN THE OPERATING FIELD

GOVERNMENT OF MANITOBA ACTIVELY INTERESTED IN SECURING INDEPENDENT TELEPHONE SERVICE.

THE formation of an Independent telephone company of mammoth proportions in Manitoba is now being considered by the local government. Several months ago petitions began to come in from the smaller towns of the province urging the government to secure the public ownership of all telephones in use in the province. When the first petition arrived Hon. Robert Rogers, minister of public works announced that he had under consideration just such a scheme. At the present session of the legislature the question was taken up and the house decided almost unanimously in favor of government control of telephone rates. Experts gave their evidence before a special telephone committee with the result that it was learned that a company could be formed and by charging considerably less than half the rates in force by the Bell company could make a very handsome return on money invested. At the present time practically half the members of the local legislature have left for the south to inspect various Independent companies in operation. It is reported that the government will offer a company every inducement to operate by guaranteeing its bonds, etc. The government plan is to finance some Independent company that will agree to government control of rates and will equip the cities, villages and towns of Manitoba with telephone systems and will also build trunk and rural lines wherever necessary. A prominent member of the government stated a few days ago that the Independent company of Manitoba, as it will be called, will be in operation within a year.

MEETING OF THE IOWA ASSOCIATION TO BE HELD AT DES MOINES.

THE next meeting of the Iowa Telephone Association will be held at the Chamberlain Hotel, Des Moines, on March 13, 14 and 15. The program will be announced later. Matters of wide general interest will be discussed, and Independent telephone men throughout the State will not fail to receive substantial benefits from attending.

LONG DISTANCE COMPANY PROPOSED IN ARKANSAS.

A MOVEMENT for an Independent long distance telephone company to extend all over Arkansas and through Texas, Louisiana and Tennessee has been started at a meeting held at Little Rock by the Independent telephone men. At the conclusion of the business it was announced that a system of Independent telephones covering 1,500 or 2,000 miles in Arkansas, and representing an expenditure of about $750,000, would probably be in operation within a year. If the plans of the Independent telephone men mature, cheaper telephone rates and improvements of great advantage to business men in the cities will result. The scheme is now being pushed by the Independent men to form a compact organization of Independent companies distributed over Arkansas, Texas, Louisiana and Tennessee. It is then planned to connect all of these companies, beginning first in Arkansas, then going to Texas, and finally into Louisiana with Memphis and Little Rock as central points. With every city of any importance in these states banded together by a long distance Independent organization, it is declared that an Independent system covering the entire South will soon follow. The first move made at the meeting was to form a temporary organization. This consisted of Dr. R. M. Drummond, of Russellville, Ark., as chairman, and John B. King, of Texarkana, as secretary. Among the Independent companies represented at the meeting were: the Russellville Telephone Company; Atkins Telephone Company; London Telephone Company; Dover Telephone Company; Citizens' Telephone Company, of Paris; Branch Telephone Company; Franklin Telephone Company, of Charleston; Home Telephone Company, Ozark; Western Telephone Company, Ozark; Lawrence County Telephone Company, Walnut Ridge; Pine Bluff Telephone Company; Memphis Telephone Company, Memphis, Tenn.; Jonesboro Telephone Company; Paragould Telephone Company; Batesville Telephone Company; Little Rock Telephone Company; Commercial Telephone Company; Pan Telephone Company, Ft. Smith; Texarkana Telephone Company; Long Distance Telephone Company, Texarkana.

CUMBERLAND TELEPHONE COMPANY FAILS TO SECURE ENDORSEMENT OF BUSINESS MEN IN KENTUCKY.

AT an open meeting of the Commercial Club at Carrollton, Ky., held on January 30th, representatives of the Cumberland (Bell) Telephone Company appeared and asked for an endorsement of an application for a franchise. After a long and thorough discussion of the question the club unanimously rejected the Bell company's proposition.

MEMBERS OF THE NINTH DISTRICT OF THE INDIANA INDEPENDENT TELEPHONE ASSOCIATION HOLD QUARTERLY MEETING.

THE third quarterly meeting of the Ninth District of the Indiana Independent Telephone Association was held at Evansville on February 1st. The meeting was called to order by W. D. Curl, vice-president of the district. Twenty-six companies out of a total of 27 in the district were represented. These companies reported nearly 15,000 telephones in operation in the district at this time. Following the disposition of some routine business, Allen Gray, of Evansville, in greeting and welcoming the members to the city, took occasion to review the local situation. Mr. Gray said conditions were never better; that the Independent companies are all operating on a safe and paying basis and the prospects of getting a foothold in Evansville are so bright as to make it almost a certainty. Mr. Gray's review of the situation was productive of a number of inquiries and resulted in the adoption of a memorial to the mayor and board of public works asking that no franchise be granted to an Independent company to operate in Evansville unless it has not only the financial ability to establish an up-to-date modern telephone system in Evansville, but one also able to make connection with the vast Independent systems surrounding Evansville and through Indiana and the central states. It is understood that the Pocket Long-Distance Telephone Company, of which Mr. Gray is president, will be the company to make the application for an opening in Evansville.

"Service Between Exchanges" was the subject of an interesting paper read by W. H. Moore, manager of the Knox County Home Telephone Company at Vincennes. Mr. Moore's paper provoked a generous discussion and a number of new ideas advanced will be put to the test at once.

The attendance was the best and the interest manifested was the most gratifying in the history of the association. The next meeting will be held at Huntingburg the first week in May.

The following are some of the more prominent telephone men present and the companies they represented: Henry Landgrebe,

INDEPENDENT TELEPHONE DEVELOPMENT IN STEPHENSON COUNTY, ILL.

STEPHENSON COUNTY, ILL., has one of the best developed Independent systems in the state. The last issue of the directory of the Stephenson County Telephone system shows a list of twenty-five towns in the county with which it connects by direct lines, besides long distance service with Ogle, Lee, Whiteside, Jo Daviess and Carroll counties in Illinois, and adjoining counties in Iowa and Wisconsin. This service will be greatly augmented in the near future, new toll lines being under construction which will enable patrons to this system to reach a very much larger number of important points in every direction.

The compilation of the directory shows that an exceptional amount of care and forethought has been spent on its composition. Every page carries at the foot some strong, pointed paragraph which draws attention to the advantages and superiority of the service rendered by this company.

The head office of the company is at Freeport, where it has about 1,400 subscribers. Patrons are able to reach nearly 2,000 more in Stephenson County. This company is essentially a home institution, it having amongst its stockholders many of the most prominent men in the county. The officers are Dr. D. C. L. Mease, president; W. A. Hance, vice-president; E. T. Morse, treasurer; L. A. Herrick, secretary and manager.

INDEPENDENT TELEPHONE COMPANIES ORGANIZE AN ASSOCIATION TO AID COMPETITION FOR BUSINESS.

THE Independent telephone companies of Boone County, Ind., have organized the Protective Telephone Association, with headquarters in Thorntown. B. P. Lielle is president and George Lyster secretary. The purposes of the association are to devise plans for mutual protection against designing agents of the Bell company, and to improve the telephone service throughout the county.

MINNESOTA COMPANY REPORTS RAPID EXTENSION OF ITS PLANT.

THE North Star Telephone Company, of Mountain Lake, Minn., has been enjoying an exceptionally prosperous year. A yearly dividend of 10 per cent. was recently paid to its 44 stockholders. During the season of 1905 this company has built 42 miles of new toll line, and strung over 100 miles of No. 12 iron wire for farmer's lines. Fifty-five telephones have been installed in connection with this new construction. On June 1, 1904, the company had 12 farmer's telephones in operation and 76 instruments in the village of Mountain Lake. Now there are 81 instruments connected on farmer's lines, 103 in the village of Mountain Lake and 39 in Butterfield, making a total of 223. In addition to those who already have connections, a considerable number of persons have forwarded applications for service, and are awaiting the construction of new lines, which will be taken up early in the spring. The directors have decided to make important extensions during the coming year. The directors of the company are: S. Balzer, Frank Balzer, J. H. Dickman, C. C. Quiring, J. D. Schroeder, and the officers are: S. Balzer, president; Frank Balzer, vice-president; J. H. Dickman, secretary and treasurer; J. D. Schroeder, manager.

INVALID IN OGDEN HEARS MINSTREL SHOW BY TELEPHONE.

THE installation of special telephone equipment for transmission from a theatre has not as yet been widely put in practice, and the Utah Independent Telephone Company has made a novel application of this comparatively new branch of service. A minstrel show was recently conducted by the Elks, and a prominent member was confined to his home by paralysis. The telephone company installed special apparatus comprising a transmitter, megaphone horn, etc., on the stage, and by connecting this to the line of the absent member made it possible for him to hear every song and joke as readily as did the rest of the audience.

NEW INDEPENDENT COMPANY FOR CRAWFORD COUNTY IN PENNSYLVANIA.

TWO hundred and fifty subscribers have been secured for the new system of the Eastern Crawford Telephone Company. This concern, which was recently organized with a capital of $15,000 will operate in Crawford County. Lines will be built from Meadville to Blooming Valley, Guy's Mills, Townville, Centerville and Spartansburg. All patrons of the new telephone company are to have free service to Meadville and subscribers of the Meadville Telephone Company are to be given free service over the lines of the new company. Construction has already commenced and it is hoped that the work will be finished early in the spring.

The officers of the new company are: President, James R. Andrews; vice-president, W. J. Maddox; secretary, H. M. Dickson; treasurer, C. S. Burwell, and general manager, John H. Wright. The directors are as follows: J. R. Andrews, C. S. Burwell, H. M. Dickson, of Meadville; John H. Wright and W. J. Maddox, of Jamestown, N. Y.; D. C. Smith, of Guy's Mills; W. H. Boss and George E. Marsh, of Townville.

EGG HARBOR, N. J., INDEPENDENT COMPANY IN A PROSPEROUS CONDITION.

BUSINESS men in and around Egg Harbor, N. J., are unanimous in their praise of the service furnished by the Egg Harbor City Telephone Company. This company, which is comparatively new in the field, has by persistent attention to the wants of the public built up an efficient system and obtained numerous subscribers. In its directory for January there is hardly a business house in town that is not listed. New subscribers are being constantly added, so that it was found necessary to reserve space in the directory where the new numbers could be inserted. At the foot of every page there are some convincing remarks relative to the value of telephone service. The officers of the company are Geo. W. Otto, president and manager; Henry Voss, vice president; H. C. Schliehting, secretary, and Lorenz Krein, treasurer.

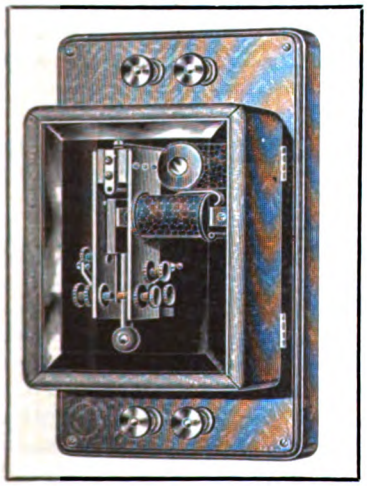
"DO YOU GET OUR RINGS"

NON-INFRINGING.

To Those of Our Customers Who Have Already Inquired and Those Who May Desire to Know:



That the Sandwich Pole-Changer, "while its appearance in the cut is strikingly similar to the Illinois," it is a very different and much better instrument. The Sandwich Pole-Changer Company is not the successor of the Illinois Electric Specialty Company. They simply purchased the tangible property of the Illinois Company last June, who had been doing business at a loss for several years, and this is the reason why *their suit went by default.*

The Sandwich Pole-Changer was put on the market by E. C. Hennis, who employed the most careful and able Patent Attorneys to see to it that this instrument was absolutely non-infringing, and it infringes no patent, then or since issued on Pole-Changers.

The Sandwich Pole-Changer Company is strongly backed financially, and is placing these instruments on the market by the hundred each month, and will protect the interests of its customers and users, as well as its own, to the end.

The Sandwich Pole-Changer is an up-to-date instrument made by the best of mechanics, of first class material. Sent on thirty days' free trial, and is in the market to stay.

TELEPHONE PATENTS

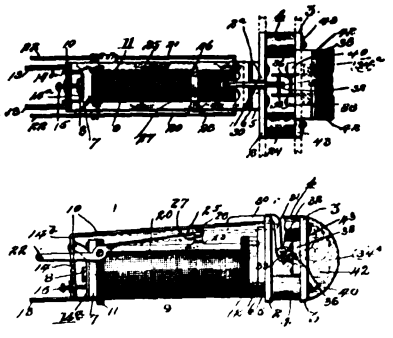
SELECTIVE SYSTEM.

Edward A. Buell, De Kalb, Ill., patents (No. 807,596; dated Dec. 19, 1905; filed Oct. 6, 1904; serial No. 227,463) and assigns to the Selective Signal and Telephone Mfg. Co., Sycamore, Ill., a party line selective system.

The essential feature of this invention is a means whereby the operator is enabled to determine whether any other than the party called is listening on a line. The selective mechanism is provided at the substations, consisting of a prolonged electromagnet which is employed to operate an escapement, which in turn revolves a wheel carrying a contact finger. A relay is so arranged with relation to the contact finger on the wheel that its armature carrying a contact point will be brought into circuit with the finger of the wheel when the latter has been moved around the desired number of points by movements of a key, controlling a battery for operating the prolonged electromagnet. The object of the relay is to momentarily attract its armature to cause its contact finger to become locked with the one on the selective wheel and thus cut-in the telephone circuit. A pole changing key is included in the operator's cord circuit. Moving it in one direction causes current to traverse the line to the substations to step around the selective wheel. Moving it in the opposite direction the prolonged magnet releases the wheel, which is returned to normal by a spring. To determine whether a party other than the desired one is listening on a line an indicator is placed in circuit with a ringing key. The removal of a receiver from a hook opens the circuit of the indicator at that station, and thus the operator, by lifting each one, is immediately apprised of the act by the non-operation of the indicator.

ANNUNCIATOR.

Halvor M. Olsen, Chicago, Ill., patents (No. 811,083; dated January 30, 1906; filed May 16, 1901; serial No. 60,792) and assigns to the American Electric Telephone Company, Chicago, Ill., an annunciator. In this invention means are disclosed for the

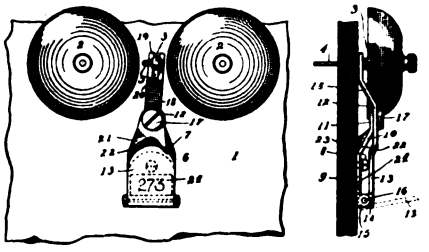


design of an annunciator signal embodying several novel features. Referring to the diagrams, 2 and 3 are plates separated by means of blocks 4. To the plate 2 is attached the coil 9, which carries insulating blocks 11, 12; 6 and 7 are pole pieces of the magnet core 8. Terminal strips 20, 21 are fastened to these blocks, one of which, 20, has a stationary contact 23, the other being provided with a spring strip 25, having a projecting contact member 27. The armature 10 is pivoted at 14b and is provided with a downward extension 14, having an adjusting screw 15 for regulating its movement. At the front end of the armature is an arm 30, which engages the arm 34 of the arc-shaped target 35, pivoted at point 36. A curved cover or case 40 serves to enclose the target 35 and is provided with an opening through which the number can be disclosed.

In normal position the target is depressed. When an electric current traverses the magnetizing coil 9 the armature 10 is attracted, causing the target to be raised into position by means of the extension 30 attached to the lifting lever 34. At the same time the contacts 23 and 27 are closed by means of the extension 30 attached to the lifting lever by reason of the pressure exerted by the armature through the medium of the insulating block 26, thus making provision for an auxiliary alarm circuit.

ANNUNCIATOR.

Walter R. Horning, Cleveland, Ohio, patents (No. 811,063; dated January 30, 1906; filed December 5, 1904; serial No. 235,617) and assigns to the Williams Telephone and Supply Company, Cleveland, Ohio, an annunciator. The object of this



patent is to provide an attachment operated by the movement of the hammer rod of a magneto bell which shall be capable of releasing an annunciator shutter to indicate that a call has been made.

An indicator 6, mounted below the bells, is provided with a base plate or support 7, having an upwardly extending portion 11. To this extension is pivoted a member 12. Its upper portion is slotted to receive the hammer rod of the ringer and the lower part is provided with two prongs beveled on their lower outer surfaces. In normal position either one or the other of these prongs engages the shutter and holds it in position. When the ringer is actuated this pronged member is vibrated and the shutter, under the action of gravity, falls forward between the prongs. It is restored to its vertical position in the usual way, the bevelled surface of the prongs making it easy of accomplishment.

TELEPHONE BRACKET.

Henry F. Foersterling, St. Louis, Mo., patents (No. 806,790; dated December 12, 1905; filed March 6, 1905; serial No. 248,686) a telephone bracket. The essential features of this device consist of means whereby a telephone supported upon a movable arm can always be maintained in a vertical position irrespective of the movement of the support in the arc of a vertical circle. This the inventor accomplishes by means of a pair of parallel bars attached to a base by several joints. The upper ends of the bars are joined together by a vertical plate to which is attached a bar terminating in a clamping device to engage the post of a desk stand. The parallel bars are hinged at both ends so that they can be moved in a vertical arc and the supporting post has a swivel point so that the bracket can be rotated in a horizontal direction. A latch is provided so that the bracket may be retained at any angle in its vertical sweep.

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

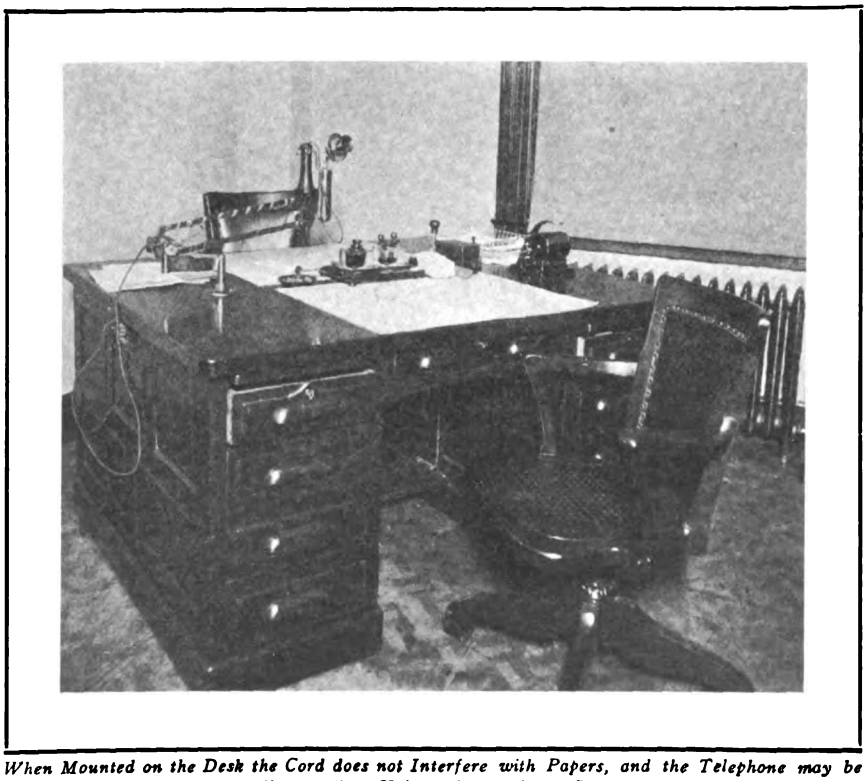
A CONVENIENT AND PRACTICAL TELEPHONE HOLDER.

THE accompanying illustrations represent a telephone swinging arm, etc., all combined in one fixture having a universal joint. The bracket is covered by patents in the name of Charles H. Borden, and owned by the Fox-Borden Manufacturing Company, 110 W. 34th St., New York, of which Charles H. Borden, of Stamford, is general manager, and Farnham Fox, of New Rochelle, is president.

This company's bracket has the following points which make it extremely satisfactory in operation. The cam spring motion gives an absolutely perfect balance of the telephone at any point from a perpendicular down to a considerably lower point than the horizontal. This is made possible by the use of a spring which may have its tension changed to exactly balance the weight of the telephone. This does away with friction of any kind, so that the instrument can be moved by a slight pressure of the hand. The company claims that there is absolutely no bearing surface to wear out, or to require oiling. The best material and finest workmanship are employed in its construction. It is an article designed for the very highest grade of service.

The Telephone Holder May be Mounted Behind the Desk, and When Not in Use Folds Back Against the Wall.

The bracket has many different motions, by means of which the telephones can be brought to any position desired by the user, so that he may speak into the transmitter when standing up or sitting down, or even to a lower position as will be required by a small child. The base of the bracket turns on a pivot, giving the whole arc of the circle. In a few words, the transmitter reaches and faces any point within a radius of two feet from a given centre. An improved switch and terminal post are used, being concealed in the heart of the bracket. As the bracket brings the telephone below the horizontal point many advantages may be secured in the location of the fixture for use by different persons.



When Mounted on the Desk the Cord does not Interfere with Papers, and the Telephone may be Adjusted for Use at Any Height, from Either Side of the Desk.

This combination makes an attractive apparatus for the wall, it being possible to stand up and use the telephone, and if a long conversation should take place, the telephone can be drawn down and the user sit in a chair and continue the conversation with great comfort. The spring causes the telephone to remain where it is put, with or without the receiver on the hook, and no friction is developed in the machine. The lower illustration shows the hook holding the receiver on a level with the transmitter, so the receiver will clear the arm and allow the whole stand to be rotated, to bring the transmitter into any desired position.

The fixture to hold the instrument can be placed anywhere that screws can be fastened. The instrument is very compact and beautifully made, and is an extremely attractive piece of apparatus.

THE ELECTRIC CABLE COMPANY, of 42 Broadway, New York, has received an order from the New York and Long Island Railroad Company for fifteen miles of cable insulated with Voltax, the new high potential insulating compound. This order follows within a week upon that of the Interborough Rapid Transit Company for the same amount of material. Severe tests are said to have shown that this material retains its elasticity and insulating properties

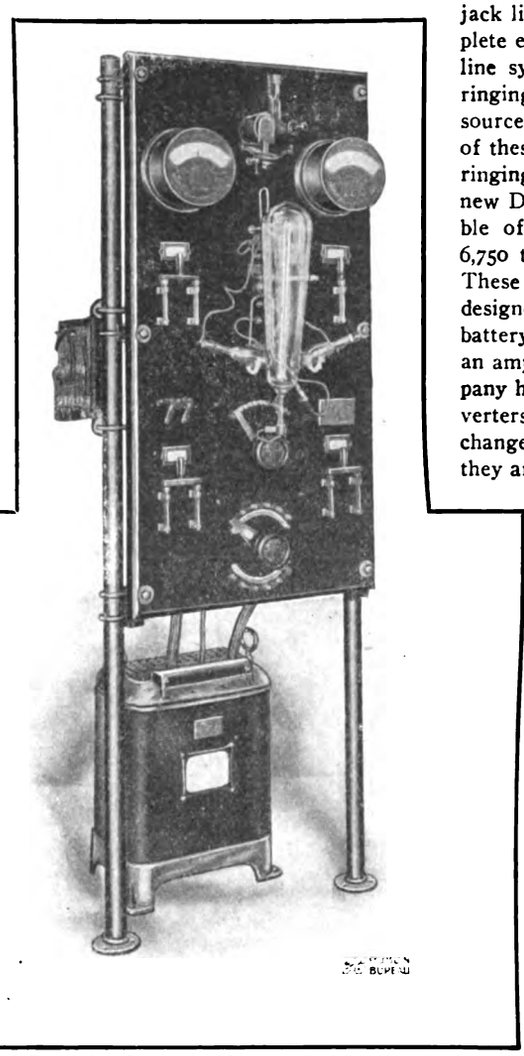
for an indefinite period, is impervious to atmospheric conditions, and is water, acid and alkali proof. Recent tests by the Electrical Testing Laboratories of New York show that the Voltax Compound will not drip under 200 degrees Fahrenheit.

A NEW METHOD OF CHARGING TELEPHONE BATTERIES.

THE mercury arc rectifier, manufactured by the General Electric Company has been most extensively used in automobile work, where it has been found to afford an extremely simple and convenient method of charging automobile storage batteries. The same reasons which have led to its adoption for this purpose also adapt it to the requirements of telephone battery charging. Owing to the comparatively low cost, compactness and high efficiency of this method of transforming alternating into direct current, there has arisen a demand for a telephone charging panel, and this has been met by an outfit developed by the General Electric Company.

The neat and compact appearance of one of these sets is seen in the accompanying illustration of a 30 ampere outfit. It consists of a mercury arc rectifier tube mounted on a black enameled slate panel with switches, measuring instruments, etc., and the necessary reactance coils. This panel stands 76 inches high and is 24 inches wide, and, as it need stand but 24 inches from the wall, is compact and self-contained. In the center of the panel, the rectifier is mounted in a substantial holder in such a manner that the shake necessary to start the tube in action can be easily given.



Special Panel for Operating Mercury Arc Rectifier Outfit.

Grouped about the rectifier are the switches and instruments, the whole presenting a neat and attractive appearance. High-grade instruments are supplied, the ammeter having its zero at the center of the scale, so as to read in either direction. There is also furnished an extenral shunt, with thirty-foot leads, to provide for a separate measuring instrument.

On the floor beneath the panel proper is located the reactance coil for adjusting the alternating current supply, thereby controlling the direct current. In addition, the General Electric Company furnishes with this outfit a suitable reactance which is so connected that it reduces the humming on the telephone circuits to a minimum. Tests of this rectifier, made by the American Telephone and Telegraph Company indicate that there is no noise on the line when the batteries are being charged. This is a point of great importance in the satisfactory operation of any charging device for telephone service.

A number of these outfits are in commercial operation in telephone exchanges, and letters from purchasers bring out the fact that their operation has afforded satisfaction.

THE STUTTGART TELEPHONE COMPANY, of Stuttgart, Ark., is installing the Baird Secret Service system and is putting in metallic lines for the purpose of securing the advantages claimed for this system.

MODERN EQUIPMENT AT QUINCY, ILLINOIS.

THE switchboard which will soon be installed at Quincy, Ill., is for a complete common battery multiple system and is to be arranged for 6,400 lines ultimate, and with an immediate equipment of 3,300 answering jack lines and 3,000 multiple jack lines. The exchange is to have a complete equipment of the Dean harmonic party line system, including individual indicating ringing keys in each cord circuit, and three sources of harmonic ringing current. One of these is to be a Holtzer-Cabot multicycle ringing set and the other two are to be the new Dean Harmonic Converters, each capable of ringing the entire exchange when 6,750 telephones are connected for service. These new Dean Harmonic Converters are designed to operate from a 24-volt storage battery and consume less than a quarter of an ampere no load current. The Dean Company has a number of these Harmonic Converters operating in common battery exchanges in various parts of the country, and they are said to not only give the best possible results in regard to the quality of the ringing current, but stand up under load and require absolutely no attention. Their extremely high efficiency renders them applicable to the smallest as well as the largest exchanges.

The power plant for this new Quincy exchange is to be complete in every respect, consisting of duplicate apparatus and power lightning protection equipment. A two-position combined chief operator's and monitor's desk and a three-position wire chief's desk are also to be included. The woodwork of the switchboard, desks and Harmonic Converters is to be of solid mahogany. The contract for this switchboard equipment, which has been awarded to the Dean Electric Company, of Elyria, Ohio, also includes the furnishing of 3,000 common battery telephones.

Messrs. McMeen & Miller have charge of the engineering of this new exchange, and the work of construction is being done by the Union Construction Company, of Quincy, Ill.

THE BLAKE SIGNAL AND MANUFACTURING COMPANY, 246 Summer street, Boston, Mass., has recently received a very satisfactory expression of approval of its insulated staples and compressed cleat, as follows: "From my inspection of the sample cleats sent us they seem to be what I often longed for when directing work in the field. For many places these are superior to your very excellent staples, as where it is necessary to run the wires on lath and plaster walls. They are superior to the staple in that they may be removed subsequently without damaging the insulation. I wish to congratulate you on your success in producing such good staples and cleats." (Signed) ARTHUR BESSEY SMITH.
Prof. Telephone Engineering, Purdue University.

THE WEEK'S MESSAGES

FINANCIAL.

KENESAW, NEB.—The Kenesaw Telephone Company has declared a dividend of 8 per cent.

WARREN, N. H.—The Baker River Telephone Company has increased its capital stock from $1,000 to $3,500.

RUSHVILLE, O.—The Rushville Telephone Company has increased its capital stock from $5,000 to $10,000.

GLENWOOD, WIS.—The West Wisconsin Telephone Company has increased its capital stock from $7,000 to $15,000.

OCONOMOWOC, WIS.—The Badger Telephone Company has increased capital stock from $5,000 to $10,000.

FRANCHISES.

OAKLAND, CAL.—A franchise has been granted to the Home Telephone Company of Alameda County for a complete telephone system in this city.

SALEM, ORE.—C. E. Sumner has been granted a franchise at Salem. Telephone franchises have also been granted to the Home Telephone Company of Puget Sound at Tacoma and Bellingham.

SPOKANE, WASH.—A franchise has been granted to C. E. Summer, of Portland, Oregon, for the Home Telephone & Telegraph Company to operate a telephone system in Spokane.

WALLA-WALLA, WASH.—The Home Telephone & Telegraph Company has been granted a franchise at Walla-Walla.

COMBINATIONS.

RICHMOND, IND.—It is reported that the Richmond Home Telephone Company and the New Paris, Ohio, Telephone Company have consolidated, and that the two plants will be operated from Richmond. Both plants are among the best in existence.

PIPESTONE, MINN.—The Enterprise Telephone Company, which is extending its system in Pipestone, is to dispose of part of its system to the South Dakota Rural Telephone Company.

MILLERSBURG, O.—The property of the Marshallville & Rittman Telephone Company has been transferred to its purchasers, The Millersburg, Wooster & Orville Telephone Company.

ELECTIONS.

JESUP, IA.—The Farmers' Telephone Company has elected the following officers: Dr. Haradon, president; John Burrill, vice-president; C. L. Bright, secretary, and Charles Brush, treasurer.

LIBERTYVILLE, IA.—The Libertyville Telephone Company has elected the following officers: President, R. O. Sherrick; vice-president, Emery Wilson; secretary, Dan Garber; treasurer, Frank Glotfelty.

MALCOM, IA.—The Malcom Central Telephone Company has elected the following officers: President, Wm. McClure; vice-president, Chas. Eisele; treasurer, C. O. Bowers; secretary, S. E. Royce.

MT. AUBURN, IA.—The Mt. Auburn Telephone Company has elected the following officers: President, John St. Clair; vice-president, L. C. York; directors, C. H. Lawson, K. K. Lamb and George Larmor.

NEVINVILLE, IA.—The Nevinville Telephone Company has elected the following officers and directors: R. H. Gregory, manager; directors: Fred Johnson, Frank Spellman and P. M. Gregory.

ROLAND, IA.—The following officers have been elected by the Roland Mutual Telephone Company: President, Dr. E. Rice; vice-president, J. H. Larson; secretary and treasurer, J. H. Jondall.

WHITE OAK, IA.—The White Oak Telephone Company has elected the following officers: E. F. Varnholt, president; George Miller, vice-president; D. C. Bowers, secretary; Amandus Lehr, treasurer.

ATCHISON, KAN.—The Atchison Telephone Company has elected the following officers: President, Theodore Gary; vice-president, J. I. Berry;

SALINA, KAS.—The Salina Telephone Company has elected the following officers: J. O. Wilson, president; John Anderson, vice-president; Clarence Wilson, secretary; Fred H. Quincy, treasurer; D. A. Van Trine, general manager.

MARSHALL, MICH.—At a meeting of the North Marshall Telephone Company the following officers were elected: President, Frank Bell; vice-president, Fred Huggett; secretary, Frank Lovejoy; treasurer, John Sackett.

PENTWATER, MICH.—The Lake Shore Telephone Company held its annual meeting and elected the following officers: H. S. Newton, president; G. F. Sands, vice-president; J. K. Flood, secretary; L. P. Hyde, treasurer; E. A. Fuller, manager. The present number of telephones in the Oceana Division is 852.

MORRISTOWN, MINN.—The Morristown Telephone Company has elected the folowing officers: J. C. Knauss, president; W. F. Sweetser, vice-president; L. A. Kisor, second vice-president; L. J. Eisert, secretary; S. R. Miller, treasurer.

TECUMSEH, NEB.—The Johnson County Home Telephone Company has elected the following officers: President, S. D. Davidson; vice-president, P. W. Hopkins; treasurer, Harry Phelps; secretary, F. F. Cobb.

BAINBRIDGE, N. Y.—The Bainbridge Telephone Company has elected the following officers: President, W. H. Hastings; vice-president, B. G. Allen; secretary, A. A. Hoyt.

COOPERSTOWN, N. Y.—The Otsego Home Telephone Company has elected the following officers and directors: President, George R. Fuller; vice-president, Geo. Whitman; secretary, John Losee; treasurer and manager, H. P. McDonough. Directors: Geo. R. Fuller, T. S. Lane, H. A. Harrison, Geo. Whitman, T. Harvey Ferris, H. P. McDonough and John Losee. The company will spend $30,000 in new construction this year.

GALWAY, N. Y.—The Galway Telephone Company has elected the following officers: President, M. McWilliam; vice-president, Walter L. Cavert; secretary and treasurer, F. L. Smith.

PORT JERVIS, N. Y.—The Port Jervis Telephone Company has elected the following officers: President, Moses Depuy; vice-president, Dr. Cuddeback; secretary, A. Parshall; treasurer, E. F. Mapes.

CONNEAUT, O.—The Conneaut Telephone Company has elected the following officers: H. H. Hunt, president; A. J. Jacker, vice-president; M. Goebricher, secretary and manager; treasurer, G. M. Brown.

DAMASCUS, O.—The Damascus Telephone Company has elected the following officers: President, A. R. Cobbs; vice-president, J. S. Walker; secretary and general manager, L. F. Pearce; treasurer, G. A. Kinsey; financial secretary, E. H. Walker.

HIRAM, O.—The Hiram Telephone Company has elected the following officers: President, F. W. Hurd; vice-president, W. D. Dudley; secretary, W. N. White; treasurer, H. F. House; manager, H. C. Hurd.

URBANA, O.—The Urbana Telephone Company has elected the following officers: President, C. H. Marvin; vice-president, J. I. Blose; secretary, E. R. Cheney; treasurer, J. C. Powers.

CLARKSVILLE, TENN.—At a meeting of the Board of Directors of the Home Telephone Company the following officers were elected: Dancey Fort, president; B. F. Gill, vice-president; W. E. Beach, treasurer; H. M. Perry, general manager and secretary.

NEW COMPANIES.

FORREST CITY, ARK.—The Caldwell Telephone Company, with its principal office at Forrest City, has been incorporated with a capital stock of $5,000. The incorporators are: W. C. Beazley, president; F. M. Satterfield, A. L. Bynum, Henry Hughes and others.

BURRITT, ILL.—The Burritt & Winnebago Telephone Company, Burritt, has been incorporated with a capital stock of $2,450. Incorporators: James McNair, W. H. Keith and Frank Colahan.

CARBONDALE, ILL.—The Ohio & Mississippi Valley Telephone Company, Carbondale, has been incorporated with a capital stock of $100,000. Incorporators: J. B. Bundy, F. W. Willard and Wm. H. Warder.

GREENVILLE, ILL.—The Bond County Telephone Company, Green-

NEWS—WANTED

THE matter contained upon the Message and Operating Field pages of this paper is contributed largely by our special correspondents. We believe, however, that there are many valuable items of telephonic interest which are never brought to the attention of the public. There is no reason why this condition should exist, and the Editor, therefore, invites all telephone companies and the officials of such companies, to furnish any information that they can consistently make public relative to financial statistics, new construction, elections, franchises and personal items.

OUR MOTTO—QUALITY AND PROMPT SHIPMENTS.

KELLOGG "MICHIGAN WHITE" CEDAR POLES

THE poles we handle are all carefully selected, and are the best grade of stock.

All shipments are prompt, subject only to car supply.

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices.

We have recently published a little book giving some very valuable information about Cedar Poles. It contains Specifications, Inspection Comments, Shipping Data, Etc. "Yours for the asking."

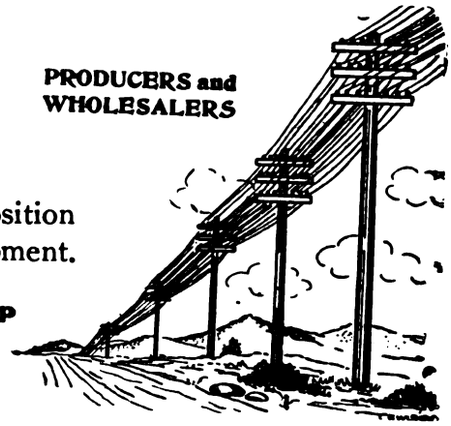
KELLOGG SWITCHBOARD & SUPPLY COMPANY - - - CHICAGO ILL.

PITTSBURG & LAKE SUPERIOR IRON CO.,
ESCANABA, MICHIGAN.

PRODUCERS and WHOLESALERS

WE always carry a large stock of all sizes of White Cedar Poles, and having yards on all principal railroads in Northern Michigan and Minnesota, are in position to make immediate shipment.

"From the Stump to the Line."



CEDAR POLES

Upon a foundation of SQUARE DEALING we have built a pole business excelled by none. Our reputation is of more importance than your order, therefore if you buy from us, you will be assured of getting what you want.

We solicit your orders and can please you in quality and prompt shipments.

THE WEEK'S MESSAGES

ville, has been incorporated with a capital stock of $6,000. Incorporators: J. S. Bradford, E. E. Wise and G. V. Weise.

CINCINNATUS, N. Y.—The Otselic Valley Telephone Company is to be incorporated with a capital stock of $10,000. The following are the directors of the company: P. C. Wheeler, F. M. Davis, E. W. Terrill, William Edwards, A. Fowlson, J. M. Murray and J. M. Lotridge.

NEWFIELD, N. Y.—The Cayutaville Telephone Company, Newfield, N. Y., has been incorporated with a capital stock of $3,000. Incorporators: J. F. Smith, T. J. Smith and Wheeler Smith, all of Newfield, N. Y., and others.

TRUMANSBURG, N. Y.—The Trumansburg Independent Telephone Company has been organized. The officers of the company are: President, Walter McKeel; vice-president, Frank Miller; secretary, Frank Carman, and treasurer, I. McKeel.

PERSONAL.

LELIO BORNO has assumed the direction of the telephonic service of Port au Prince, the capital of the Island of Hayti, West Indies.

CECIL FEARIS has been appointed manager in Waxahachie, Texas, for the Ellis County Independent Telephone Company.

LELAND HUME has been promoted from the office of assistant general manager to that of general manager of the Cumberland Telephone Company. Mr. Hume was also elected president of the Nashville Board of Trade.

FRED LININGTON, who has been manager of the exchange of the Southwestern Telephone and Telegraph Company at Houston, Tex., has been appointed superintendent of construction in the State of Arkansas, with headquarters at Little Rock.

WILL T. VAUGHAN has been appointed manager at Mayfield, Kentucky, by the Cumberland Telephone Company.

MISCELLANEOUS.

CARTHAGE, IND.—R. S. Hamilton, of Morristown, Ind., has recently closed an active canvass for the Independent Telephone Company. A rental list of 790 was raised to 1,005 in sixty days.

JUDSON, IND.—The co-operating telephone lines entering Judson have organized the Judson Switchboard Association, and claim to have the system on a paying basis. A new contract with the Park County Telephone Company, on the same basis with the local company's contracts now in force with other co-operative companies, provides that the patrons of the Park County Telephone Company shall pay a line charge of five cents per call for the use of the Judson line.

ORLAND, IND.—A fire alarm service has been inaugurated on the lines of the local telephone system.

HOLT, MO.—The Holt Telephone Company has severed connections with the Bell company and will hereafter be connected with the long distance lines of the Home Telephone Company of Kansas City. The company has installed new central office equipment.

HURDLE MILLS, N. C.—The North Carolina Telephone Company now has in operation 60 miles of line and is giving excellent service. Its plant is so well constructed that no damage was done by the recent heavy sleet storm. The company recently paid a quarterly dividend of 12 per cent.

WASHINGTON, O.—The Institute Telephone Company has been reorganized.

VIBORG, S. D.—The Tri-County Telephone Company's exchange was destroyed during a recent fire at Viborg.

EFFINGHAM, ILLS.—The Wabash Valley Telephone Company has been rapidly increasing the number of its subscribers during the past three months. The number has been raised from 110 telephones three months ago to 225 at present.

READING, MICH.—The Reading Central Telephone Company has closed a contract with the Steuben County Electric Telephone Company by which rates to Indiana points are materially lowered. The Steuben company owns 18,000 telephones in the county with 26 toll stations and has trunk line connections with 145,000 telephones in Indiana.

HOMER, N. Y.—The Cortland Home Telephone Company has agreed to install a fire alarm system for the town.

TOLEDO, O.—The Toledo Home Telephone Company has decided to extend the system of four-party, selective call, lockout telephones. The rate for service from these instruments will be $18 a year net.

New Construction in the Field

OAKLAND, CAL.—The Home Telephone Company is to place its wires underground.

NEZ PERCE, IDAHO.—The Nez Perce Co-operative Telephone Company is to build a line into Grangeville.

DECATUR, ILL.—The Citizens' Telephone Company, of Decatur, is to build party lines in all directions from Berne.

CARYDON, IND.—The Harrison County Telephone Company is extending its lines to the Floyd county line near Georgetown, where connection will be made with the line of the Home Telephone Company of New Albany and Louisville.

OWENSVILLE, IND.—The Independent Telephone Company of this city is to install a new switchboard.

ELK HORN, IA.—The Marne & Elk Horn Telephone Company is to extend its lines to Audubon.

KINSLEY, KAS.—The Kinsley Telephone Company is to build a line to Kirkfield.

BOWLING GREEN, KY. The Home Telephone Company is to establish an exchange at Russellville.

ELLSWORTH, ME.—A. M. Fogg has completed the construction of 51 miles of metallic lines and installed 50 telephones for the Union River Telephone Company in Hancock County. The line runs from Ellsworth to Great Pond, via Waltham, Amherst and Aurora.

ST. PETER, MINN.—The Cannon Valley Telephone Company is to spend $4,000 in improving its system.

PATERSON, N. J.—The Paterson, Passaic & Suburban Telephone Company is to build lines into most of the surrounding towns.

CHAMPLAIN, N. Y.—The Champlain Telephone Company is to extend its system to Mooers Forks.

DELPHI FALLS, N. Y.—Messrs. Cummings and Stoddart are to extend their telephone lines to Pompey Hollow.

ITHACA, N. Y.—The Ithaca Telephone Company has commenced the construction of its underground system.

HURDLE MILLS, N. C.—The North Carolina Telephone Company will soon install a new switchboard at Rougemont, N. C., and is putting in a metallic line from Rougemont, via Bahama, to Durham, N. C.

NANTICOKE, N. Y.—The Glen Aubrey and Whitneys Point Telephone Company is building a line from Ketchumville toward Newark Valley; also south toward Maine through a territory which has been without service. From Nanticoke lines are being extended northward to Caldwell Settlement. Another pair of wires will be run from Nanticoke to Whitneys Point and from Aubrey to Lisle.

RUSHVILLE, N. Y.—The Seneca-Gorham Telephone Company is building several new lines.

WARREN, N. Y.—The Warren Telephone Exchange of the Union Telephone & Telegraph Company is to be connected with Yankee Bush.

CLEVELAND, O.—President Frederick S. Dickson, of the Cuyahoga Telephone Company, has recommended the expenditure of $600,000 for construction work.

LEBANON, OHIO.—The Valley Telephone Company is to install a complete new exchange.

PORTLAND, ORE.—Work is progressing rapidly on the underground system of the Home Telephone and Telegraph Company. When completed, there will be more than fifteen miles of trench, and of this amount more than one-half is now ready for the cable.

ASHLEY, PA.—The People's Telephone Company is to establish an exchange.

DUNN'S STATION, PA.—The Farmers' Telephone Company is to build a telephone line from Dunn's Station to Amity.

SUGAR RUN, PA.—A Farmers' telephone line is to be built from Sugar Run to connect with the Bradford County Telephone Company at Wyalusing.

IPSWICH, S. D.—The Edmunds County Telephone Company plans many important extensions to its system in the near future.

KNOXVILLE, TENN.—The People's Telephone and Telegraph Company is preparing to put down more underground conduits for its lines. Two car loads of material have arrived and the work of laying underground wires will be begun in a short time.

NASHVILLE, TENN.—The Nashville Mutual Telephone Company is to construct lines to Venedy, Okawville and Addieville.

CANADIAN, TEXAS.—The Stockmen's Telephone Company, of Canadian, Texas, is building lines to Lipscomb and Ochiltree, as well as towns in Beaver and Woodward Counties, Oklahoma.

PULLMAN, WASH.—The Ewartsville Telephone Company is to build lines to Pomeroy, Dayton and Walla Walla.

ELM GROVE, W. VA.—The National Telephone Company, of Wheeling, W. Va., is to establish an exchange at Elm Grove.

OSCEOLA, WIS.—The Osceola Farmers' Mutual Telephone Company is considering the construction of a telephone line to Milltown.

An Ounce of Prevention
is worth a pound of cure, especially when applied to poles. Unprotected poles do not last very long, and setting new ones takes time and labor in addition to the cost of the poles. We treat poles with creosote, which makes them invulnerable to the attack of insects or any of the rot diseases. If you are putting up poles to stay you must protect them. Creosoting them is the best way and we have the best facilities for this purpose.
The Norfolk Creosoting Co., Norfolk, Va.

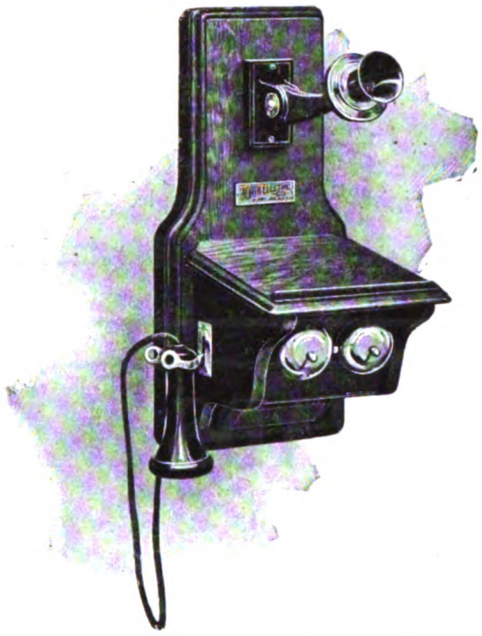
NORTH COMMON BATTERY TELEPHONES



The hinged front of "NORTH'S" common battery wall type telephone renders the condenser and instrument wiring accessible without removing from the wall.

The cabinets are not veneered, but every stick of lumber is from a veneered mill; for they handle nothing but the most beautifully figured woods. The stock is 18 months old, kiln dried 30 days and given a hand-rubbed finish involving 7 processes.

They are equipped with the following standard parts, and will operate on any standard common battery system.

"NORTH'S" Solid Back Transmitter that combines ample volume, perfect articulation, deep penetration and natural pitch.

"NORTH'S" Permanently Adjusted Receiver. The diaphragm does not rest on the outside shell, but on a bell-shaped metal seat—it isn't thrown out of adjustment by unequal expansion of hard rubber and magnet metal.

"NORTH'S" New Ringer, provided with a knife-edge, weighing-scale bearing armature—it can't tighten or drop out of place.

"NORTH'S" Horizontal Lever Adjustable Tension Switch-hook with long flexible contact springs—they can't break or become misplaced, and always resume their normal positions.

The parts are individually tested—the transmitter by an engineer. There are two inspections during assembling, a final test on completion and again a test before shipping—just to make sure.

DEAN TELEPHONE APPARATUS

THE DEAN ELECTRIC COMPANY
HARMONIC CONVERTER
TRADE MARK

A New Harmonic Ringing Machine

We have published from time to time the name Harmonic Converter in our advertisements. This new device has now passed the experimental stage and has been thoroughly tried in practice so that we now feel at liberty to make an announcement.

This Harmonic Converter is a new device for economically supplying alternating ringing currents for harmonic selective party lines, and to do all of the regular ringing of the exchange.

It operates from any direct current source, primary battery, secondary battery or from the power plant of a common battery exchange.

The ringing current delivered by the Harmonic Converter is strictly alternating in character and so designed to give the best possible results without causing noise in the talking circuits or any inductive disturbances in the lines when ringing.

The current consumed to operate this Harmonic Converter is 1-50 of that required to run a motor generator set of equal capacity.

This machine can be made for any size exchange, local or common battery. In fact we now have a great number of these Converters already supplying all the ringing current in exchanges ranging in size from one position up to 6,400 lines.

If you are conscious of your geniousness in the telephone field, you can demonstrate it no better way than by using the Dean harmonic selective system with a Dean Harmonic Converter for supplying the ringing current. Write for our folder No. 5 which gives complete details of this remarkable invention.

The Harmonic Converter is manufactured only by

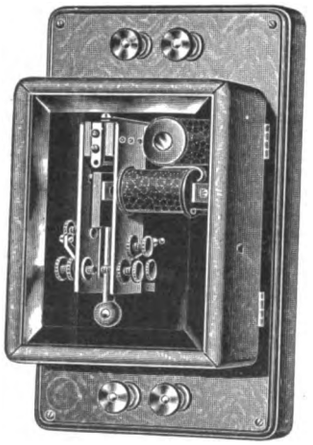
SIMPLICITY
is the Keynote of Success

A simple device which accomplishes the same results as a more complex one is certainly more preferable. The Sandwich Pole-Changer is the simplest device ever constructed for ringing purposes. There are but three contact springs and as these engage alternately with their opposite sides they cannot be forced out of position by constant use.



It requires no adjustment, as this is done at the factory and is permanent.

The use of a primary constant current battery to operate the vibrator has been dispensed with; a minute quantity of current, hardly a milliampere, being taken from the ringing battery, through suitable resistance coils for this purpose.

It will work in either a vertical or horizontal position, which permits it being hung on a wall or mounted on a cabinet. Another excellent feature is that it is practically noiseless. There are others which are described in our free booklet. Let us send it to you.

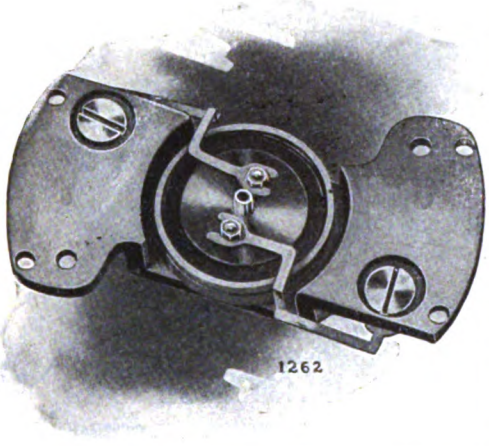
The Stromberg-Carlson Transmitter



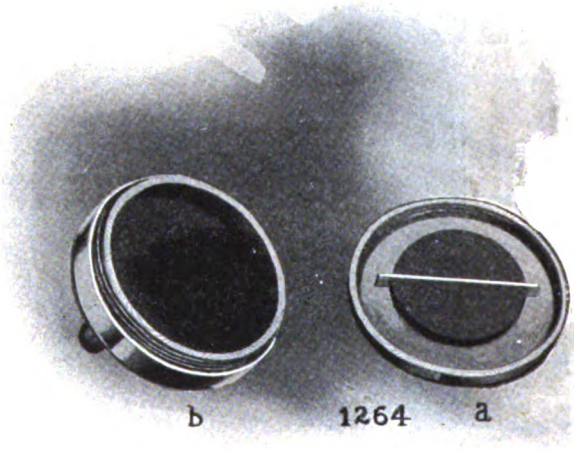
DIAPHRAGM WITH CONNECTORS AND CARBON CUP ATTACHED

Is decidedly different from any other you have ever seen. Different in ways that count for better transmission. This is quite noticeable when the transmitter is used on long distance lines. At a very slight cost you can prove this to your entire satisfaction.

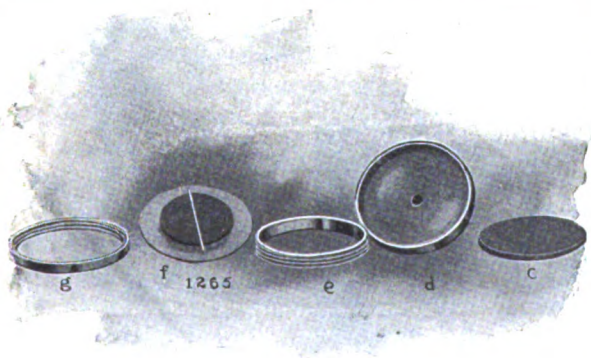
Why not do it?

THE ELECTRODES

Are made of carbon, and both are attached to the central point of the main diaphragm. There is thus produced a variation in the distance between the electrodes of twice the amplitude of variation of the central point of the main diaphragm. It is unnecessary to claim greater volume of transmission than if only one electrode moved.



CARBON CUP WITH CARBON REMOVED



PARTS OF CUP

We give the transmitter such an adjustment that under ordinary tones of voice the volume is not as loud as some of the forms of sensitive transmitters now on the market. As the voice is raised, however, the volume of transmission from the instrument is multiplied two-fold so that the transmission, when talking in a loud tone of voice, has much more volume than that of any other type. The advantage of this is readily seen.

Let us send you our new booklet describing and illustrating this transmitter. It tells the whole story; we mail it free. Just ask for Booklet No. 91-B.

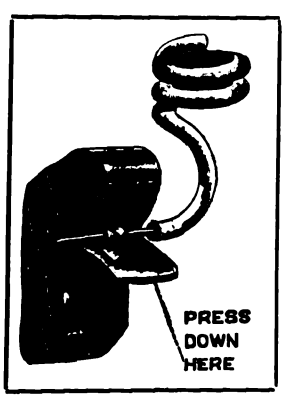
Not Yet But Soon

we expect that every dry battery sold will be equipped with FAHNESTOCK SPRING BINDING POSTS. There are several reasons that confirm us in the belief. It is the only post ever devised which eliminates uncertain contacts. When a wire is introduced between the spring clasps of a Fahnestock post, it is going to stay. No amount of vibration will work it loose.



Those who have tried it, know this to be true, and what is more, they would as soon buy telephones equipped with the old Blake transmitter as to accept a barrel of dry cells which are furnished with screw posts.

Any man that is honest and who has tried the Fahnestock post will tell you that everything we claim for it is true, but if you want to demonstrate its good points for your own satisfaction, we'll send you a sample free.

All battery makers equip their dry cells with this post free of charge if you demand it, and we are sure you will if you see a sample.

Some Telephone High-Tension Crossings

By John Putnam.

Illustrations from Original Sketches by B. S. Stevens and Photographs by the Author.

RISING in the Berkshire Hills, and flowing south and southeast, along the western border of Connecticut, is the Housatonic River. In the Algonquin Indian dialect its name was Wassatunick, meaning "bright stream flowing through the rocks." It has been called the most beautiful river in Connecticut, for along its banks there is a variety of scenery of the most charming description. It is navigable for small boats for a short distance from its mouth, perhaps nine or ten miles, but it has a more practical value fifty miles farther above. There, in the northwestern part of Connecticut, the river drops about a hundred feet in each five miles. The early settlers appreciated this source of power, and along the river banks they built their saw and grist mills. These were, in their turn, driven out by the steam engine. Engineers, however, are again turning their attention to the river's bountiful strength, and aided by long distance electric power transmission are delivering that power where it will be most useful.

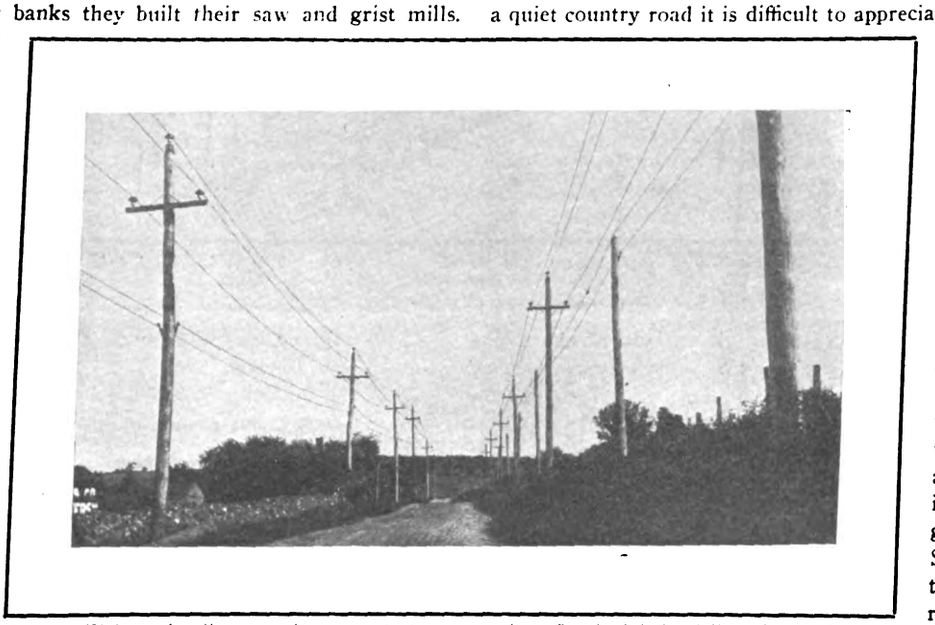

Fig. 1. High tension line, carrying current at 33,000 volts. On the left hand line of poles is a private telephone line used by the power company.

The introduction of the transmission of power by high voltage electric currents has caused the Telephone Company to develop special methods of construction for carrying its lines across the routes followed by the high tension lines. These circuits have recently been built for the conveyance of power to various centers of industry from generating plants located on the Housatonic and other rivers.

Among these power plants is one that transmits its energy from the Housatonic River near New Milford over a double line (Fig. 1), about sixty miles long to Waterbury and New Britain, to which cities it furnishes light and power to run the street railways. At these terminals are the usual step down transformer stations. This power is transmitted by a three-phase current at a voltage of 33,000. The wire used is seven-strand No. 6 aluminum, and the insulators are of the three petticoat porcelain variety. Originally there were glass insulators on the line, but the experiment was not a success. Thirty-three thousand volts is hard to confine; it is a veritable streak of lightning.

The genius who invented the method of splicing the high tension wires deserves mention here. He has evolved a combination of three ideas, the McIntyre sleeve, a pipe union and that dear old solid geometrical figure, the cone. The sleeve is, of course, single. Imagine two hollow aluminum cones, cylindrical near the base, one threaded right hand, the other left. These are strung onto the two ends to be spliced, the base of the cones towards the end of the seven strand. Smaller plain cones with a straight hole through their centers are now strung onto the central wire of the strand, which is riveted over the base of these cones. The strand is pulled back through the first mentioned cones, which now clasp the ends tightly. Then the union, which is a single cylinder of aluminum, threaded right and left at each end, is screwed on to both cones and the splice is complete. Try to think out how to splice a wire rope, without solder, without a sailor's splice, or a clumsy knot, making a joint that is electrically good, and see if you can improve on the above method.

As one follows those three seven-strand aluminum wires along a quiet country road it is difficult to appreciate the enormous force carried by them. It is asserted by the power people, however, that an arc fifteen feet long may be drawn from them. Some one else is welcome to try this interesting experiment, for we have passed the door bell, induction coil, experimental age.

In fact, the 33,000 volt line seems to work as well broken as when it is intact if the weather is good and wet. South of Washington, Conn., one very rainy day, the third wire of the power line broke down, one broken end dangling down the pole for a distance of about six feet, the other laying on the ground possibly sixty feet from the pole. At this point the Telephone Company had an underground crossing about 200 feet long. The conduit was of iron pipe, and in it was a single pair lead covered circular loom cable. This was burned in two about six inches from where it came out of the pipe. At the central office in Washington the manifestations of a heavy foreign current were noticed and the pair of wires in trouble were immediately short circuited. Later the power line break was reported to the telephone exchange, which in turn reported it to the power company in New Milford. The power company would not at first credit the report and, strange though it may seem, used the line with the broken third wire from 5:30 in the afternoon until about 7:15, when they switched over to the north line, and the telephone bells at the subscriber's stations stopped ringing after having dinned melodiously for nearly two hours.

The reader will notice that the pole at the left of the picture in Fig. 1 is charred between the cross arm and the brackets. When the power line was on glass one of the insulators snapped, the wire fell on the arm, neatly and quickly burned it in two, and charred the pole to the depth of an inch or two for a distance of six or eight feet down before the current could be thrown on to the other

Digitized by Google

line. Thirty-three thousand volts loves old mother earth. As said before, this line furnishes the entire power for the lights, motors and street railways of the cities of Waterbury and New Britain, and these cities have 46,000 and 26,000 inhabitants, respectively.

In Fig. 1 the line on the brackets below the power line, on the left, is the Power Company's private telephone line. By shifting the brackets and crossing the wires it is transposed every three sections.

Normally the brackets are directly opposite each other on either side of the poles. When it is desired to transpose the wires they are placed perhaps twelve or eighteen inches apart, the right hand bracket over the left on one pole, under it on the next one. One wire of the metallic circuit then passes from the right of one pole to the left of the next, the other wire from the left of one pole to the right of the next. Thus the lines cross at every third pole.

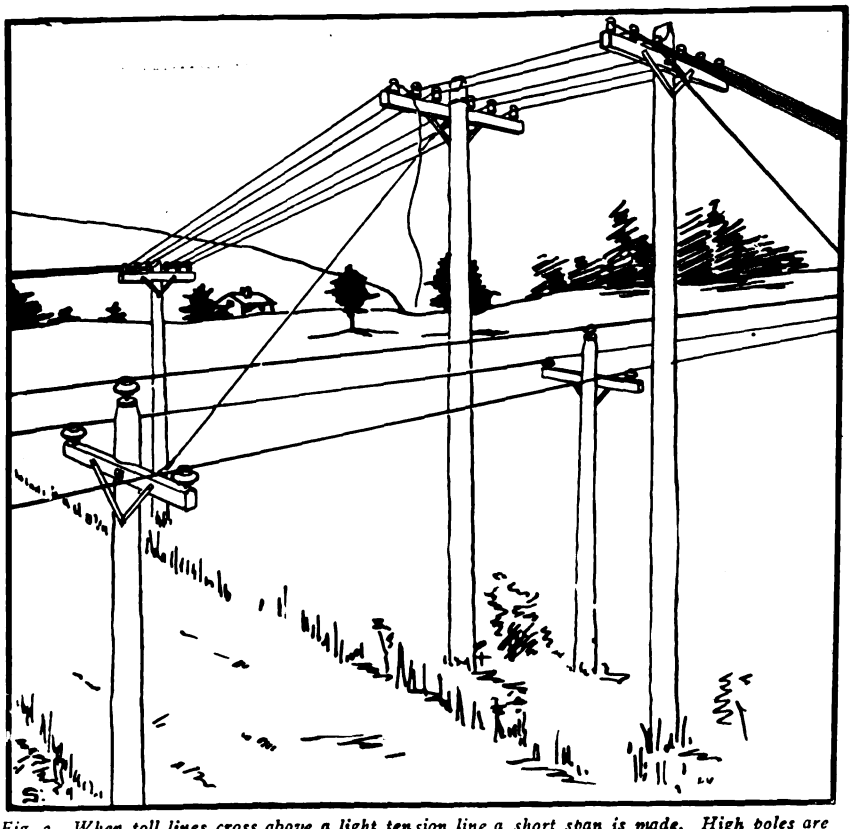

Fig. 2. When toll lines cross above a light tension line a short span is made. High poles are used, so that if a telephone wire should break the end could not reach the power company's conductors.

The superintendent of the Power Company says that there is an induced alternating current of 700 volts on this telephone line when they are running the high tension over it. In the graphic language of the day the Power Company's telephone line is a hot proposition. The writer was one day in the Telephone Company's Washington exchange when sparks began to fly between the carbons in a certain pair of wires. The heating coils were pulled out and after half an hour the trouble having come clear they were put back. The symptoms were those of a high resistance cross with an alternating electric light circuit. Later in the day about six miles from the office we found that one of the conduit foremen was getting ready to place this line underground where it crossed the high tension line. One of the men had cut a guy which slacked the telephone line down onto the Power Company's telephone line with the above result. A native told the foreman that his bell which was on the line had rung hard for quite a while. No bells on the line, however, were burned out.

Between the telephone instruments on the Power Company's wire and the line are repeating coils and fuses. Between the fuses and the line are helices of heavy wire, one helix in each side of the line, their purpose, of course, being to retard any foreign high voltage current.

The usual spark gap form of telephone protection was tried, copper blocks being used instead of carbons, but there was a constant discharge to the ground of the 700-volt induced current, and a consequent constant disturbance in the telephone. The power people were equal to the emergency. They inserted a single pole, single break and throw, knife switch in the ground wire and left it open.

One telephone man who read the preceding sentence remarked wonderingly that this would take the ground off the protector. When it was painstakingly explained to him that that was the correct answer and was what made it humorous, he was very much pleased and grateful.

That the influence of the high voltage circuit is far reaching was shown by the following incident which brought the fact forcibly home to the Telephone Company. Extending from the central office in New Milford are a few telephone lines which parallel the high tension lines for several miles, being as near to it as fifteen feet in some places. One day there was a snap and a crack in the main frame and three lines were found open. The trouble was finally located in an aerial cable which showed three pairs of open conductors in spite of the fact that the cable terminals were provided with the usual fuse and carbon protection. The cause of the above trouble was at first perplexing to the telephone men, for the day was clear and there was absolutely no sign of any atmospheric electrical disturbance. Later it developed that the discharge into the Telephone

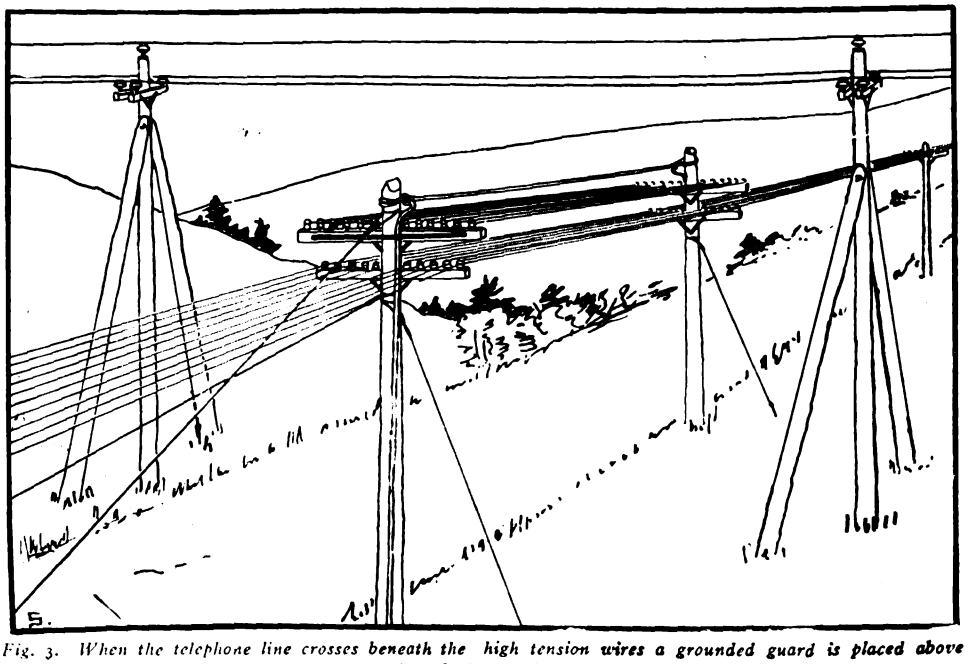

Fig. 3. When the telephone line crosses beneath the high tension wires a grounded guard is placed above the telephone wires.

Digitized by Google

Company's cable was coincident with a person's touching one of the incoming power wires at the Waterbury transformer house. This, of course, threw a ground on the power wires, and some of the telephone wires were then within their influence. Normally, a section of the field of force surrounding the three phase line might be represented by a trefoil, the center of each leaf being a section of one of the high tension wires. When the line is grounded the field of force is suddenly enlarged, extending then from the line to the earth, and bringing within its influence any unfortunate telephone wires that are too near. Although not pertinent to this article, it may be of interest to the reader to know that the inquisitive person who felt of the high tension circuit in the Waterbury transformer house was not killed.

Now, a mile of 25 pair 22 gauge aerial cable in the air and spliced up is worth about $700, or $28 per pair of conductors. A loss of three pairs in that cable means a depreciation of 12 per cent. or $84. Plainly, the Telephone Company can afford to spend a few dollars to prevent such depreciation.

There are several high tension lines in the State of Connecticut of various voltages and the lines of the Telephone Company cross them no less than 65 times.

Some provision out of the ordinary should be made when it is necessary for telephone circuits to cross high tension lines, both as a protection to the telephone plant and to prevent loss of service to subscribers. Certain conditions should be fulfilled in case of a break in either type of circuit, telephone or high tension. If possible, they should not touch at all after a break. This condition would leave them in practically the same electrical relation to one another as they were before. If this condition could not be fulfilled, artificial means should be constructed to so damage the falling circuit that it would shortly be beyond harming itself or its neighbor. Still a third method would suggest itself to any thoughtful engineer, that of introducing insulated or grounded protection of some kind about the under circuits.

Let us start with the electrically self-evident truth that our telephone high tension crossings should be made at right angles. Fig. 2 shows what might be called the ideal way to make these cross overs. In it, we simply set two poles of the line crossing over as near to the line it crosses as we can. These poles should be so high that if a wire of the span breaks it will swing clear of the line under it. In the drawing is shown a wire broken and swinging clear. The insulators on the arms of the two high telephone poles should be of the transposition type and the cross over span and line each way should be dead ended on them. The line wires should then be sleeved around the glass. This guards against the span slacking down on account of a break on either side of it.

One designer proposes grounding the arms and pins of the high tension lines on each side of the crossing, when the high tension line crosses the telephone line. The theory of this is very pretty, but it does not take into consideration the necessity of obtaining the permission of the Power Company to put it into practice. One can imagine the enthusiasm with which such a proposal would be received by a company maintaining a 33,000 volt transmission line, which to avoid metallic guys is braced.

Unfortunately, however, this crossing shown in Fig. 2 is frequently impracticable. Maybe poles cannot be set near together on account of highways or railroads. Perhaps the grade of the line is such as to call for impossibly high or expensive poles. In Fig. 3 we guard against a break in a high tension line crossing over a telephone line. A special twelve-pin arm is placed on the poles on either side of the high tension line above the arms carrying the telephone wires. These arms are back-braced and a screen of No. 6 iron wire strung between them. Over the screen, from the tip of pole to pole is erected a steel hoisting rope which is grounded at the base of each pole. This rope is of a sufficient diameter to carry the high tension current to ground, in case of a cross, without itself being fused. Theoretically, should the high tension line slack down on to this crossing it would immediately burn in two on the grounded hoisting rope. The twelve-pin arm screen would prevent the broken wires from striking the telephone lines on their way to the ground. It would be very interesting to know what would actually happen should the above accident take place. The Telephone Company has not in the past had any experience with such a trouble and the strength of construction of both lines would not seem to invite it in the immediate future. One theoretical fault is, however, at once apparent with this crossing. The screen is insulated and by pony glass insulators. These would not offer any great opposition to the passage to ground of a 33,000 volt current. Consequently, should a high tension wire carrying the above voltage fall on such a sereen it would probably burn through it and the telephone wires below it with the greatest facility. The writer knows of one instance where a lineman on the top of a pole pulled up a telephone wire against a high tension line carrying 11,500 volts. The No. 12 telephone wire was burned in two instantly, and the man was unharmed. The telephone wire terminated in a coil that lay on the ground.

(To be continued.)

Secret Cord Circuits

By Albert DeVries.

As the old question of secrecy in telephone exchange systems seems to have been recently revived, it may perhaps be of some interest to the readers of The American Telephone Journal to note what has been done in Europe along this line.

The first system which could claim secrecy was the old Law system, which, under the name of the "call wire" system, was used in England by the National Telephone Company a long time ago. This system solves the question of secrecy in the simplest way, the operators being unable to connect their speaking instruments to the subscribers' lines, but receive their orders, to connect or disconnect, verbally through the call wire, which is permanently connected to the operator's receiver. As, however, the advantage of secrecy and simplicity in this system did not counterbalance its many drawbacks in other respects, it is now almost everywhere replaced by other systems. We believe the only exchange which still uses the call wire system is the older branch of the Glasgow Corporation exchanges.

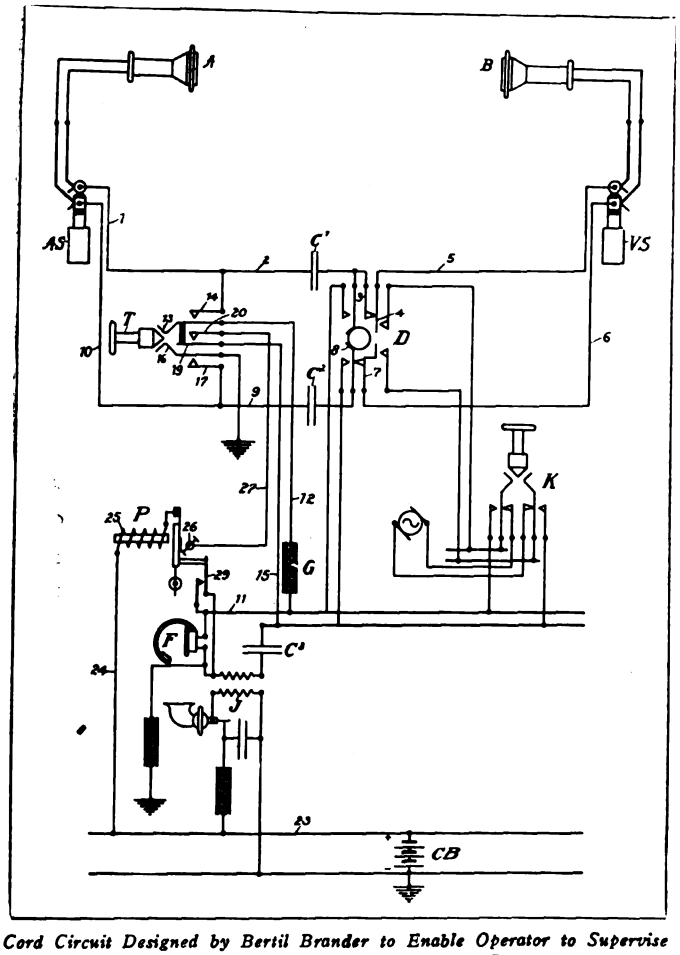
Further there are systems using a plug switch for disconnecting the operators' instruments from the cord circuit as soon as the calling plug is lifted. This system, as well as a system with speaking keys which interrupt the talking circuit in the speaking position, similar to the Beard system, has been in use in England and Germany for some years. These systems are, however, not suitable for modern multiple systems with multiple jacks, because the devices in question do not prevent the operators from overhearing a conversation by plugging the multiple jack in the next section, even if the precaution is taken that a double break answering jack is used. Thus the said secret systems are mainly applicable to small private exchanges or exchanges using the express or similar systems, for which the secret device is undoubtedly of great value.

Of the secret systems in use in Europe there is one, invented by a Swedish telephone engineer, Mr. Bertil Brander, which seems to be a desirable solution of the problem of secrecy. This system enables the operator to listen in and hear whether the parties are talking, but at the same time prevents her from understanding the conversation by means of an automatic interrupter which cuts out the operator's receiver intermittently while she is listening. Mr. Brander describes his system as follows:

"It is a well-known fact that the general method of arranging the cord circuits in telephone systems in such a manner that the operator can easily overhear the conversation is a very undesirable and, particularly from a public point of view, objectionable feature. Various attempts have also been made to overcome

Digitized by Google

this drawback, but in most cases without success, owing to difficulties arising from the lessened supervision, particularly in systems without automatic supervisory signals. It is thus obvious that in every secret system where the operator has to *rely exclusively on signals* for the disconnection, the possibility of a connection being cut off either too soon or too late, is greater than if she is able to ascertain by listening whether the parties have finished or not.



Cord Circuit Designed by Bertil Brander to Enable Operator to Supervise While Preventing Her from Understanding Conversation.

"For these reasons I arrange the circuits so that the operator can ascertain, by listening, whether conversation is going on, but at the same time she is prevented from conceiving the content of the conversation by means of an automatic interrupter, which intermittently and with short intervals short circuits or cuts out the operator's receiver when she is listening, thus breaking up the sentences which come to the operator in fragments and resulting only in inarticulated sounds. The usual key for speaking and ringing is in this case arranged to interrupt the talking circuit when turned in the speaking position. This key can, of course, easily be arranged in such a manner that the operator can converse with either of the two subscribers, but not with both simultaneously.

"In carrying out the invention any suitable interrupter can be used for cutting out the receiver. A simple device is an electrically driven pendulum, similar to the familiar automatic pole changer used for ringing purpose in small exchanges. This pendulum need not be kept permanently in motion, but is preferably arranged in such a manner that it is set to work only while the operator is listening.

"The accompanying diagram indicates the arrangement of the automatic interrupter in connection with the cord circuit. The answering and calling plugs, AS, VS, are as usual connected by means of the flexible cords, and the combined speaking and ringing key D is arranged to interrupt the talking circuit in the answering position, as will be easily understood from the arrangement of the springs 7, 8, of the said key D. A separate listening key T is arranged similarly to listening keys in other systems, with the addition of the springs 19, 20. When the key T is pressed, the springs 19, 20 close a local circuit of the battery CB through the windings of the coils of the automatic interrupter P, which is provided with an oscillating pendulum arranged to close intermittently the contact between the springs 29, which are directly connected to the terminals of the operator's receiver F. A retardation coil G may be arranged in series with the receiver in the listening circuit, and in case of a common battery system a condenser or polarization cells C' are also inserted in the same circuit, in order to prevent any disturbing sound when the operator listens.

"The contact springs 29 are normally kept out of contact by the pendulum 30 of the interrupter, but if the listening key T is pressed the pendulum will be set in motion, causing the springs 29 to touch each other momentarily, and thus the receiver is intermittently short circuited so long as the key T is pressed.

"This listening device is of course applicable to all kinds of central exchange systems, sub-exchanges and intermediate stations, and it may even with advantage be used for intercommunicating telephone systems, to prevent a third party overhearing a conversation."

There is undoubtedly some truth in Mr. Brander's opinion that it is not altogether safe to rely only on the signals. For instance, in the Western Electric Company's system, if the clearing out relay would not close the contact properly for the shunt of the clearing out lamp, this lamp would burn during the conversation and cause the operator to turn the key and interrupt the conversation, whereas in the Brander system she would first press the listening key and then, in case there is no conversation going on, she would turn the speaking key and inquire if the subscribers have finished.

ORGANIZATION OF INDEPENDENT COMPANIES OF ARKANSAS COMPLETED.

By Charles F. Speed.

THE Independent companies of Arkansas have not only formed plans for establishing a complete and satisfactory toll service, but have perfected the organization of a State association. A meeting of Independent telephone companies was held at Little Rock to consider the questions of toll lines and a State association. Neither subject had received any definite attention heretofore, although the importance of both had been generally recognized. Sixteen companies sent representatives, and the meeting was called to order on February 12 with Dr. R. M. Drummond as chairman and John B. King secretary. The meeting was for business from the start, and committees were appointed to consider membership, by-laws and the subject of taking in those who are now connected with the Bell lines as members.

The committees made their reports at the hour set for the afternoon meeting. The committee on membership reported that all present desired to become members and were ready to sign the constitution and by-laws when adopted.

The committee on by-laws reported with a full constitution and by-laws, which, after being considered in detail, were adopted. The committee, whose duty it was to consider the subject of taking in those who were at present connected with the Bell lines, reported favorably to taking any one into the association who is now or who shall at any future time be engaged in the Independent telephone business in the State of Arkansas, and who would sign the constitution and by-laws. This permits all those who are now connected with the Bell lines to become members upon declaring their intention to become completely Independent.

The election of officers was then taken up and resulted as follows: Eugene Hale, Ozark, president; Dr. R. M. Drummond, Russellville, vice-president; John B. King, Texarkana, secretary, and P. C. Ewing, Little Rock, treasurer. The officers and Mr. O. W. McClintock, of Walnut Ridge, were made directors.

The president was directed to take the necessary steps to secure membership in the National-Interstate Telephone Association, and

Digitized by Google

instructed to appoint a delegate to attend the meeting to be held in St. Louis in June.

At the evening meeting the question of toll lines was taken up, entering into every detail of the situation.

The question of toll lines was again taken up on the second day of the meeting, and resulted in an agreement to organize a long distance company, to be known as the Telegraphone Company of Arkansas, with the following officers and directors: W. D. Hearn, banker, Pine Bluff, president; L. Minor, banker, Newport, vice-president; Chas. F. Speed, Texarkana, secretary; W. B. Worthen, banker, Little Rock, treasurer; W. A. Latham, Fort Smith; J. S. Warren, Memphis; John B. King, Texarkana; Mack Hammett, Pine Bluff; W. M. Rickert, Little Rock, directors. The capital is $300,000, divided into 12,000 shares of $25 each.

All the Independent companies of the State have agreed to sell this stock to their subscribers, which assures the success of the undertaking right from the start, not only in the sale of stock, but in getting the business after the lines are built. With twelve thousand people directly interested in the success of the company it cannot fail to give the desired results.

The lines are to be built from Memphis to Fort Smith, and from Texarkana to the Missouri Line, where it is expected to get the connection with all the Northern Independent companies.

The Telegraphone Company does not propose to put up a foot of iron wire, making everything copper of a size not less than No. 10. Whatever lines are built are to be of the highest standard construction. In this way ample provision will be made for securing the highest quality of transmission on these lines, which may be required to carry messages over long distances. At the same time their durability will insure the smallest proportion of expense for maintenance.

CHARLES F. SPEED, Secretary of the Company which will furnish toll service in the South.

The meeting was attended by many prominent telephone men, including J. S. Warren, Memphis; W. P. Ritchie, Camden; P. C. Ewing, Little Rock; R. Brink Tyler, Louisville, Ky.; J. E. Tunis, Carlisle; Eugene Hale, Ozark; W. Arthur Latham, Fort Smith; Dr. Keith Hudson, Dahoma; Conrad Elsken, Paris; O. W. McClintock, Walnut Ridge; John B. King, Texarkana; Mack Hammett, Pine Bluff; I. Minor, Newport; E. C. Brewerоff, St. Louis; Edward Bowers, Dewitt, and Dr. R. M. Drummond, Russellville.

Economical Telephone Accounting and Filing Systems

ARTICLE IV.—OPERATORS' TOLL TICKETS AND RENTAL AND TOLL BILLS.

*By Charles C. Wilmot, Telephone Accountant.

This article and all forms reproduced have been protected by individual copyrights.

Copyright, 1906, by The American Telephone Journal Company. All rights reserved.

METHODS of taking care of the complex details of the long distance toll business and of handling the collection of toll and rental bills with the least amount of time, expense, and labor, are worthy of the most careful investigation and study on the part of all telephone officials. The subjects of operators' toll tickets, toll and rental bills and billing systems are of vital importance to every telephone manager in the country. False economy should not so influence the management that it will force the office manager to continue in old deep ruts of worn out methods.

The accompanying reproductions of copyrighted forms for operators' toll tickets for "In," "Out," and "Through" messages have stood the practical test of actual service in many exchanges. All the information necessary for recording and billing a toll message is fully provided for, as well as space for the use of a "Calculagraph" in recording elapsed time. The size of this form is 3½ x 5 inches.

These forms should be printed on a fair quality of paper, of a different color for each form, which will give a good legible record for the use of day or night operators. It is poor policy to overtax the eyesight and time of operators by using cheap thin paper and poor printing.

Fig. 11. Operators' tickets for In, Out, and Through business. These tickets are 3½ x 5 inches in size.

*Editor's Note.—Mr. Wilmot is manager of the Telephone Systems Department of the Edwards & Hine Company, Grand Rapids, Mich.

Digitized by Google

It will be noticed that the information on these forms is entered in the natural order of the usual method of receiving details for calls, and also arranged to expedite the work of bill clerks. These tickets should be sorted by telephone number and arranged in consecutive order. This classification should be done by a night operator, so that the billing clerk can proceed each morning to bill the charges of the previous day and night messages. The subject of an economical and quick reference method of filing of toll tickets will be covered in a later article.

In Fig. 13 is shown a form, No. G-84, for toll bills, for use in small exchanges. Bills are to be made out with an indelible pencil or stub pen and carbon sheet, thus giving a bill for subscriber and a carbon copy for the office record. Collector's coupons are to be torn off of the original bill and turned in to the cashier with the cash by the collector, or by the office clerk who takes the money. Each line of a bill is numbered for the convenience of the subscriber or collector in telephoning or writing

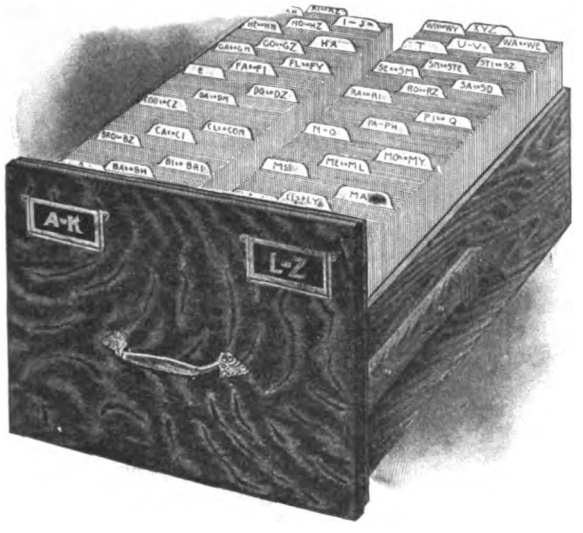

Fig. 12. The vertical system of filing toll bills, as shown in this illustration, is a time-saver.

in to the office regarding a disputed charge. The duplicate portion of the bill can be made with stubs wide enough to be punched for filing in a loose-leaf binder by telephone number or alphabetical arrangement. The vertical system of filing, as shown in Fig. 12 is strongly advocated. Sheets in this system should be arranged by telephone numbers between stiff cardboard guide cards in preference to an alphabetical arrangement. This method, with a numbered guide card for every 10th number, will be found to save time in making out the current month's bills, which should be charged up daily, as well as in filing the carbon copies after the originals have been torn off and delivered. In small, or branch exchanges, monthly toll bills can be posted directly from these duplicate bills to the "Monthly toll charges report," form No. G-76 shown in the previous article, on "Branch exchange reports."

(To be continued.)

POOR BELL SERVICE AT SEATTLE CAUSES PEOPLE TO UNITE IN THROWING OUT INSTRUMENTS.

NOTICES to the number of over a thousand on the first day, followed by hundreds of others signed by the leading business and professional men of Seattle, Wash., demand the removal of Sunset telephones as the result of a determination made at a mass meeting on Feb. 21.

The report of the investigating committee at the mass meeting, embodying the results of the committee's investigations of the local telephone situation, presented by W. T. Dovell, was a severe arraignment of the service the Bell company has given to Seattle for years past. He said:

"I am here to report to you the condition in the telephone systems as the committee in charge has found them. I shall call attention to what we believe, and to what Seattle citizens believe, are abuses of the system. One of these is the necessity we are under of using and of paying for two entirely different telephones.

"Now we believe that payment for one telephone is enough. The question is, which telephone shall we choose?

"During the past few years it is a notorious fact that the Sunset service has been inadequate and inefficient. This is not the time for the telephone management to apologize. It will not do to say that the growth of the city has been so great as to outstrip the telephone service, when at the same time another telephone company has put in many more telephones and given a complete and efficient service. We have nothing against the Sunset management. It is a question of discarding the one that has not given satisfactory service or the one that has given fair treatment and fair prices.

"The people must pledge themselves to take out one telephone, and, manifestly, that must be the Sunset.

"I am advised that the Independent company is prepared to install at once four to six thousand telephones. By the first of next August all those who desire to change can get the Independent. By the first of next year we could supplant every Sunset telephone in the city. The Independent now has made its long-distance connections certain.

"The suggestion I offer is this: Let every person present sign to-night a notice to the Sunset Telephone Company to remove its telephone by the 1st of August. The removal slips read as follows:

"Seattle, Feb. 21, 1906.

"Sunset Telephone and Telegraph Company, Seattle, Wash.—Gentlemen: On August 1, 1906, please remove my Sunset telephone, which number is now ———— street, Seattle, Wash., and oblige,

"....."

The Independent system was praised for fair play and good management, and the whole tenor of the committee's report was overwhelmingly in favor of the Independent as against the older system.

MISSISSIPPI VALLEY COMPANY TO MAKE IMPORTANT IMPROVEMENTS.

PLANS are now being considered which have for their object extensive improvements in the system of the Mississippi Valley Telephone Company. A meeting of the officials was held recently at Burlington, Ia., at which W. H. Taylor, representative of John E. Andrus, of Yonkers, N. Y.; S. S. Thorpe,

QUERIES

CAPACITY OF CONDENSER.—(663.)

Would a 4 microfarad condenser in a telephone receiver circuit give better results than one of 2 m. f. capacity? J. W. N.

THE use of a 4 m. f. condenser in a receiver circuit would produce very slightly better results than would one of the lower capacity. The function of the condenser is chiefly to keep direct current from passing through the receiver. Its disadvantage is its resistance to alternating current. The amount of this resistance for a condenser of a given capacity is determined by the frequency of alternations. For voice frequencies in a 2 m. f. condenser the resistance is about 50 ohms. This figure is so small when compared with the total resistance of the circuit including the receiver and induction coil at the subscriber's station and the repeating or retardation coil at the central office that a 4 m. f. condenser, although having approximately one-half the resistance of one of 2 m. f. capacity, does not make sufficient improvement to be commercially worth while.

REPEATING COIL IN NOISY LINE.—(664.)

How does a repeating coil cure a noisy line? J. W. N.

A REPEATING coil separates one section of a line conductively from the other, and prevents leakage or inductive disturbances in one part from finding a path to ground in the other. Its use is beneficial only in cases where a part of the line which is well balanced and well transposed, but subject to some electrical disturbance which raises the potential of both wires, is connected to a portion which is not so exposed to the external cause of a rise or variation in potential, and which is unbalanced through partial grounds or otherwise. In this case the passage of a varying current over the wires is due to the unbalanced condition of the whole circuit which is the result of poor balance in one of its parts. As the presence of foreign potential in equal amounts upon both wires of a well balanced pair, and likewise the presence of slight grounds upon wires which are not otherwise subject to external influence, is not usually sufficient to produce a noise in the receivers, the separation of the two parts of the line will bring about some improvement. It should be noted, however, that the reduction in the amount of noise is accompanied by a diminished efficiency both in ringing and in transmission, and the use of a repeating coil is to be considered only as a makeshift. The proper remedy is to clear the line from the disturbing influence.

BRANCH EXCHANGE TRANSMISSION.—(665.)

Would a 500 ohm coil across a cord circuit of a branch exchange interfere with the transmission? J. W. N.

A 500-ohm non-inductive resistance would seriously shunt transmission in accordance with Ohm's law. A 500-ohm inductive coil, provided with a continuous iron core in order to give as great an inductance as possible, when properly wound does not produce sufficient effect to be appreciable from a commercial standpoint. The loss is probably not greater than 3 per cent.

HOLDING COIL.—(666.)

Which would give the best results, a coil of plain resistance or a retardation coil, when placed across a cord circuit as a holding coil? J. W. N.

IT depends on what is to be done while the holding coil is on the line. If the coil is to be on during communication it should be inductive, in order to offer the least shunt to the transmission current. If not it may be non-inductive.

LONG DISTANCE TRANSMISSION.—(667.)

Why has communication across the continent never been established? J. W. N.

FOR two reasons. The first is that the amount of business would not pay returns on the tremendous investment necessary for the building of the lines. The second is that if the lines were built the current waves would be so distorted that speech could not be intelligibly transmitted over such long lines.

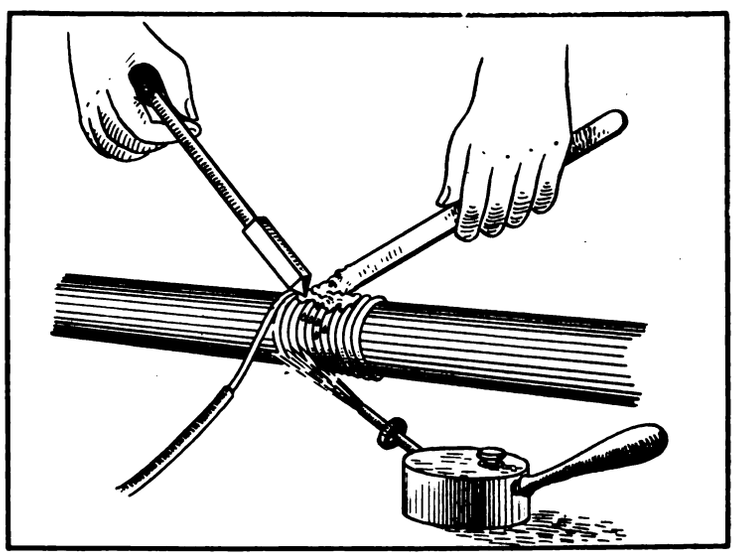

Fig. 668.

BATTERY GROUND CONNECTION.—(668.)

I notice in your issue of February 10th you say that central office batteries should be grounded. Will you please describe the method of making a ground connection? R. W. A.

ON storage batteries of the tank type a copper lug should be burned into the positive terminal bus bar of the battery, and the ground connection should be made by means of this lug. No. O wire should be run to the nearest available good ground. The best ground is obtained on a water pipe connected to the street mains. The next best thing is a gas main, with the ground connection made between the meter and the street. If neither of these is available, a buried ground may be used. This should preferably consist of a coil of buried wire having a great many turns, say about one hundred feet of wire, loosely coiled up. This coil should be placed in a hole deep enough to reach permanently moist earth. It is well to pack the bottom of the hole to the depth of an inch or two with finely divided coke. In this way a good ground is certain to be obtained.

To make a ground connection on a water pipe the wire, beginning at the point where it reaches the pipe, should have the insulation removed, and the surface of the copper should be scraped until it is clean and bright. The surface of the pipe at the point where the wire is to be wrapped on it should be filed until it is clean and bright over the whole area to be covered by the wrappings. The surface of both the wire and the pipe should then be thoroughly covered with soldering paste. The wire is then wrapped tightly around the pipe for ten or twelve turns. The next process is the soldering, and for this it is necessary to use not only a large, well heated soldering copper, but also to keep the flame of a small blow torch applied constantly upon the surface to be soldered (Fig. 668). In this way the pipe and wire are kept thoroughly heated, and no attempts should be made to apply the solder until it will melt when touched to the wire, without the aid of the soldering copper. The solder should be spread with the copper, and care should be taken that every portion of the wire is thoroughly sweated to the pipe.

THE EDITOR'S PAGE

RECENT PATENT DECISIONS.

DECISIONS against the Bell interests in two recent patent cases relating to circuits should be extremely gratifying to Independent telephone men. The failure to accomplish the object of these suits has a much wider significance than is involved in the mere attainment of a right on the part of the Independent operators to use the circuits which have caused the litigation. It is likely to act as a distinct damper upon the tendency to endeavor to restrict Independent development by this annoying form of litigation.

The patent suits instigated in the past by the Bell interests have had two distinct objects. One of these has been, of course, to limit the resources of the Independent manufacturers. There are certain well defined principles applying to the design of telephone circuits which must be followed to produce satisfactory results. As was so clearly pointed out in the opinion of the court, which we printed last week on the legal editor's page, some of these principles are matters of common knowledge to those skilled in the art of circuit design. While their successful combination into working circuits may involve a high degree of ingenuity such an adaptation of principles to practice is capable of being made, and is being carried on every day, by numerous designers. Where so many men, working with the same materials, are able to produce similar results, it is difficult to say where genuine invention begins. For this reason, the only method which has seemed to be available has been to assume proprietorship in the principles themselves, and it is this attempt which was made in the two instances recently decided.

This method of procedure strikingly suggests the mode of operation in the case of the original patent on the telephone. In this instance the right to the exclusive use of the instrument was granted before a single Bell telephone had ever transmitted a clearly articulated word. It was established in the subsequent litigation that the patent was granted solely on the strength of the inventor's claims based on a conviction that a successful instrument could be made on the lines laid down in the description. In this case the patent on the principle was sustained. In the two more recent cases, however, the attempts to secure the exclusive rights in the development of other principles involved in modern practice have most signally failed. This will result in much greater freedom to Independent manufacturers in the design of switchboard circuits.

Another and most important blow to the Bell interests lies in the injury which these decisions have done to one of the annoying arguments which have been used with the object of preventing the building of Independent plants. In times past the establishment of an Independent system has been the signal for the appearance of numerous articles in the press hinting at the dangers of adopting a system liable to be tied up by an injunction brought in the course of patent litigation. Such statements must necessarily weaken the confidence of prospective investors in the territory to be covered by the new company. As the Independent plants depend to so large an extent upon local capital, often obtained from persons who have neither the knowledge nor inclination for an investigation of such claims, the serious effect of such statements is evident. Moreover, they have been intended to discredit existing systems in the popular mind, by creating the impression that the Bell companies control patents which enable them to use systems capable of giving service immensely superior to that which can be obtained by the use of circuits and apparatus which do not conform to their designs. The decisions show conclusively that the field of circuit design is sufficiently open to allow the Independent manufacturers to use systems which conform to the highest standards of modern practice.

BRANCH EXCHANGE OPERATING.

SUCCESSFUL service to private branch exchanges requires the careful completion of calls by the branch exchange operator. Inasmuch as this class of operating is seldom completely under the control of the telephone companies which establish the main connections the supervision of this service presents numerous special difficulties.

In small branch exchanges the switchboard is frequently cared for by an operator who is not continuously engaged in the work of handling telephone connections. As the companies using this class of service are usually anxious to obtain the fullest returns for the operator's salary she is given other duties which may presumably be carried on without interference with her work at the switchboard. The greatest care should be exercised in the choice of these secondary duties. It is evident that they should be of such a nature that they may be properly carried on without incurring the necessity of even a momentary absence from her position at the board. Any appliances necessary for their completion should be so arranged that their location on the switchboard is not necessary, and that the abandonment of the objects in hand at the moment a call is received can be accomplished without delay. Above all things it is essential that the operator should be thoroughly drilled in the practice of giving first attention to telephone calls, and making all her other work most thoroughly subordinate to her regular duties. The delay caused by the double switching and double repeating of numbers involved in the handling of calls through a branch exchange is quite sufficient to cause some slight annoyance to the subscriber accustomed to quick service over lines leading directly to the person with whom he wishes to speak.

In addition to being a skilful telephone operator, trained to make connections quickly, the branch exchange attendant should be familiar not only with the business of the establishment in which she is employed, but with the duties of each member of the organization, and with the places in the building where each person is likely to be found when not located at his regular post. One of the principal causes of annoyance to the person who wishes to carry on by telephone a business transaction with a house whose organization is not familiar to him is the difficulty of getting in communication with the individual who is competent to talk on the matter in hand. Cases where a call is switched to one department only to meet with a reference to a second and even further are too frequent to cause surprise. These instances of poor service cause an annoyance to the telephone subscriber which is wholly out of proportion to the mere delay which he experiences. Inasmuch as each of these instances is a case of poor service which tends to discourage the use of the telephone on the part of the calling party, and of the extension of the branch exchange system generally amongst those familiar with its difficulties, it is a matter of direct and substantial interest to the telephone company.

Any influence which the telephone company can bring to bear for the improvement of these conditions is sure to produce most satisfactory results. Such interference is justified by the company's interest in reducing the time necessary for its subscribers to complete a call and should improve the efficiency of the system.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

HEIGHT OF WIRES ABOVE CROSSING IN NEW YORK.

Will you kindly answer the following questions in the Legal Department of your journal?

First: What is the lowest point at which wires may be lawfully maintained above the crown of the road where a line crosses the highway in the State of New York?

Second: What is the lowest point when a line is built inside of the ditch, and where no part of the line, either crossarms or wires, is above the highway?

Third: Are the requirements different for city, towns or country highways?

Fourth: Where the line is built along the highway and crosses a railroad which runs at right angles to the highway, at what height can the lowest wire be? Is this height regulated by law or the railroad company? G. N.

THIS whole matter is not governed by statute, but rests in each case upon what would be reasonable under the particular circumstances involved. A telephone company is under obligation to string its wires at such a height in crossing the highway and building inside the ditch along city, town or country highways, as will avoid accidents of all kinds. This height it must determine for itself at its own risk, except where local municipal authorities have passed their own regulations. In such case these regulations must of course be complied with. In building over a railroad track at a highway crossing, the height is regulated by the railroad company, because in the State of New York the use of a public highway for the construction of a telephone line is an additional servitude, and entitles the abutting owner to compensation. Eells v. American Telephone & Telegraph Company, 143 N. Y. 133; 38 N. E. 202. The consent of the abutting owner is therefore necessary, and at a point where a public highway crosses the right of way of a railroad company the latter occupies the position of abutting owner.

SERVICE OF PAPERS OVER TELEPHONE LINE IN OKLAHOMA.

IN a number of Oklahoma counties the rural telephone lines are used at court times for serving subpoenas, summoning jurors and witnesses and other court business which would otherwise necessitate long and tedious drives for the officers. A law passed by the last Oklahoma Legislature legalizes the service of paper by that method. It is also of advantage to the farmer as well as the court official at court time, as the man who has been summoned as a juror or witness and is kept waiting around for his case to come up can call up his home several times a day and give personal directions for the conduct of affairs on the farm.

WHAT IS A PUBLIC USE?

A BILL in equity was filed by Joseph C. Brown against Amos F. Gerald and others, praying for an injunction to restrain the defendants from erecting a line of poles and wires across the plaintiff's farm in Benton, Kennebec county, Maine. The defendants admitted an intention to erect the line of poles and wires, but claimed they had a right to do so under the charter of an electric and power company, in the exercise of the right of eminent domain. By its charter the company was empowered to manufacture, generate, sell, distribute and supply electricity for lighting, heating, traction, manufacturing or mechanical purposes, but the company could not use the electricity for these purposes on its own account. The court held that the acts enumerated did not constitute a public use for which private property might be taken against the will of the owner. It decided that such a corporation does not, by accepting the provisions of its charter, become a quasi public corporation and does not thereby become invested with the right to exercise the power of eminent domain. Defining a public use, it was stated that that only can be considered a public use where the government is supplying its own needs, or is furnishing facilities for its citizens in regard to those matters of public necessity, convenience or welfare, which, on account of their peculiar character and the difficulty or impossibility of making provisions for them otherwise, it is alike proper, useful and needful for the government to provide. Brown v. Gerald, 61 Atlantic, 785.

TELEPHONE COMPANIES AS COMMON CARRIERS OF NEWS.

Can you cite us any cases that apply to telephone companies as common carriers of news? We own a line to a neighboring exchange. They refuse to connect with us on any terms. We can call them over the toll wires of another company, but all our calls are refused. The reason for this discontinuation is that they are in sympathy with an exchange in our town with which we are in competition. Is there a legal remedy for our difficulty? R. L. P.

THE following cases hold that telephone companies are common carriers of news: Hockett v. State, 105 Ind. 250; Central Company v. Swoveland, 14 Ind. App. 341; Cumberland Telephone & Telegraph Company v. Hendon, 71 S. W. 435; State v. Nebraska Telephone Company, 22 N. W. 237; Central Company v. Fehring, 146 Ind. 189; Haber, Blum, Block Hat Company v. Southern Bell Telephone Company (Ga.) 45 S. E. 696; Phillips v. Southwestern Company (Ark.), 81 S. W. 605.

The cases do not yet go far enough to enable one to say with confidence that one telephone company can compel another telephone company to connect with it. On this subject see Campbellsville Company v. Lebannon Company, 80 S. W. 1114; People v. Central Company, 58 N. Y. Supplement 221; 53 N. Y. Supp. 574; People v. Hudson River Telephone Company, 19 Abb (N. Y.) 466; Shephard v. Telephone Company (N. Y.), 38 Hun. 338.

MAY ENTER ON ANOTHER COMPANY'S POLES.

IN the injunction proceedings instituted by the borough of Washington, Pa., against the State Mutual Telephone Company, which, after failure to get a franchise, came into the borough without a franchise over the poles of another company by mutual agreement, the court has decided that the company had a perfect right to do so. It was strongly contended by the borough solicitor that the company had no right to enter the borough without having first secured a franchise, but the company asserted that it had a right to enter providing it came by common consent over the poles belonging to another company. The court held that the act of March 19, 1903, allows any telephone company to use poles of another company which have already been erected with the consent of the borough authorities. The company already in the borough under a general ordinance not limiting the number of wires that it can string on its poles, can contract to allow an outside company to run wires on its poles without asking the consent of the borough. Injunction was accordingly refused.

IN THE OPERATING FIELD

SITUATION AT EVANSVILLE, IND., DEVELOPS ADDITIONAL INTERESTING FEATURES.

THE Retail Merchants' Association, of Evansville, has entered a vigorous protest against the Council granting a new franchise, or ratifying the action of the Board of Public Works in granting a franchise to the Cumberland Telephone Company. The merchants charge that an effort is being made to force the Cumberland franchise through in defiance of objections or other interests. The Merchants' Association is favorable to an Independent Company and its protest to the Council sets out the fact that the Citizens' Telephone Company filed an application for a franchise three weeks before the Cumberland filed any application, and that nothing had been done with it. The protest also pointed out that the Citizens' franchise was similar to the Cumberland's franchise in every way, except that it offered a lower rate to subscribers. Mayor Boehme is said to be favorable to the Cumberland, but there promises to be a warm time in Evansville if the Independents are not given a fair consideration. The Evansville situation will not be cleared up until the Independents are given a foothold. The people are demanding that they be let in and then, as they say, "Rates will take care of themselves."

GROWING BUSINESS OF INDEPENDENT TELEPHONE COMPANY IN TEXAS.

TEXAS, the state of magnificent distances, is becoming noted for the extension and rapid development of Independent systems. An excellent example of this growth is furnished by the People's Home Telephone Company, of Gainesville. This system, although in its infancy, has shown remarkable vitality. All the prominent business men and farmers in the surrounding county are subscribers, and parties are always on the waiting list, although the company is doing all in its power to extend the lines to meet the growing demand for its high class service. In and around Gainesville it now has upwards of 675 subscribers and to the branch exchange at Valley View there are connected about 60 others. Its toll and long distance service is very extensive, thirty-two of the most important towns being listed in the directory and besides these there are a number of less important points which can be reached. Fort Worth, Dallas, Paris, Sherman, Weatherford, Bonham, Arlington, etc., are points with which a considerable toll traffic is exchanged, and the business is being rapidly expanded, owing to the excellent service rendered. The rates are for business, $2.50; residence, $1.50; and extension telephones, $1.00 per month in Gainesville and business, $2.50; residence, direct wire, $1.25; and four party, $1.00 per month in Valley View. The plant is common battery and of the latest type. In every respect the system is up to date, which is one reason for its very satisfactory growth.

KENTUCKY INDEPENDENT COMPANY REPORTS INCREASE IN INCOME DURING PAST YEAR.

AT the annual meeting of the stockholders of the Fayette Home Telephone Company, the annual reports showed very satisfactory improvements in every way during the past year. The income of the company for 1905 was $68,288.46, as against $59,599.73 for the year 1904, and over $3,500 of collectable bills were carried over from 1905. The company was enabled to improve the condition of its plant, and, after paying dividends on both its common and preferred stock, has a good balance to the credit of its surplus fund.

The estimate for the year 1906, based upon the business done during the month of December, 1905, was $71,204.20. The president of the company announced that with the same average increase of telephones and toll service he could confidently count upon an income for the ensuing year of $75,000.

The report of the growth of the plant showed that the company had 2,244 telephones in use upon January 1, and that the number of subscribers is steadily increasing. The principal business transacted at the stockholders' meeting was the election of a board of directors for the ensuing year, and the following gentlemen were elected:

John R. Allen, George A. Bain, Dr. David Barrow, Desha Breckinridge, F. A. Bullock, L. G. Cox, George K. Graves, Charles Kerr, John McClintock, W. K. Massie, C. C. Paterson, J. W. Porter, J. D. Purcell George S. Shanklin, John T. Shelby, John Skain, J. W. Stoll, all of Lexington; John L. Dunlap, Louisville; John M. Lassing, J. W. Bannon, Eminence, and John Y. Rout, Versailles.

The following officers were elected for the year 1906: George S. Shanklin, president; John T. Shelby, vice-president; J. W. Stoll, treasurer, and Charles Kerr, secretary.

MEETING OF THE SIXTH DISTRICT OF INDIANA INDEPENDENT TELEPHONE ASSOCIATION.

THE sixth district of the Indiana Independent Telephone Association, comprising Clay, Greene, Owen, Parke, Putnam, Sullivan, Franklin and Vigo counties, held its first meeting at Terre Haute on February 7. Earl B. Talbott of Linton, who is one of the vice-presidents of the State organization, and who is also president of the district association, presided.

The following officers were elected for the ensuing year: E. D. Talbott, president; E. G. Bush, Brazil, secretary-treasurer; C. R Duffin, Terre Haute, J. W. Weik, Greencastle, and J. G. H. Klingler, Brazil, were apointed a committee on by-laws. The following auxiliary committee from the respective counties was appointed: J. F. Slinkard, Greene County; W. Turpin, Putnam; W. W. Harbrough, Sullivan, Ind.; J. W. Atchison, Vigo County.

After perfecting the organization, the meeting was taken up with a discussion of general operating conditions throughout the district, according to a statement furnished by one of the officials. Reports from the companies represented showed that the Independent interests are in excellent condition.

C. S. Norton, secretary-treasurer of the State organization, was present and addressed the meeting on the conditions prevailing throughout the State. His report showed that in the entire State there are 200,000 Independent telephones in operation, which is seven times as many as operated by the opposition. The association adjourned to meet in three months at Brazil, Ind.

PLANS PROJECTED FOR NEW TOLL LINES TO ILLINOIS CITIES FROM PEORIA.

TOLL line service was the principal feature of a discussion of Independent men at a recent meeting in Peoria. E. R. Conklin, of the Inter-State Company, invited the representatives of the systems in the adjacent territory to Peoria to the conference. Among the men who responded were Messrs. James Barrett, of Pekin; Myers, of Washington; Bullock, of Eureka; Summers, of Metamora, and Fleming, of El Paso.

In the course of the meeting the growing use of Independent toll lines was discussed, and it became evident that the lines would have to be greatly extended to handle the new business. The Inter-State company is at present constructing a number of

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE, CHEAP—600 pairs self-soldering protectors. Also one 300 pair and one 500 pair main distributing frame, used less than two months. Will sell separately or together. Address Virden Telephone Exchange, Virden, Ill., or Girard Telephone Exchange, Girard, Ill. 420

FOR SALE—Switchboard and apparatus, outgrown and displaced by automatic equipment: Kellogg switchboard, twenty 8-panel, 3-position, mahogany, equipped for 5,200 main lines, ultimate capacity 6,000 lines; Kellogg toll board of 9 positions; Kellogg telephones, 4,064 wall and 2,136 desk; Sterling terminal rack, with protection; power plant, with charging and ringing machines and storage batteries; offered for sale in whole or in part. For particulars address The Columbus Citizens' Telephone Company, Columbus, Ohio. 548

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

A SQUARE deal is what we aim to render both employer and employee, when seeking the right man for a place, or the right place for a man. Without effort on your part, without endangering your present position, and without using your employers' time, we hunt up the position for which you are best qualified. Let us find the positon for you. Hapgood's, Suite 511, 309 Broadway, New York City. 464

POSITION WANTED—All-round man can take construction or switchboard work. Some experience with cable. Married, sober; 10 years in the work. Factory experience. Address L. F. Tate, R. F. D. No. 5, Attica, Ind. 554

WANTED—Position as manager, exchange 3,000 to 5,000 subscribers; eight years' experience in the Independent field; understand the telephone business from the ground up; competent and reliable. Can furnish adequate references as to qualifications, habits, etc. I will guarantee to "deliver the goods" in exchange management. Address Box 559, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 559

WANTED—Practical telephone man desires position as assistant superintendent or troubleman. Eleven years' experience. Best of references. Address Box 560, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 560

WANTED—Continued.

WANTED—An active partner with some money to put in a good paying telephone business. Owner is forced to take this action because of lack of capital to carry on rapidly expanding business. Address Box 543, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 543

WANTED—Position as manager. Have had 14 years' experience in all branches of the business from the ground up. Past eight years have managed and superintended construction. Married and temperate. Very best of recommendations. Address M., 2119 A, Cass avenue, St. Louis, Mo. 552

WANTED—By telephone manufacturing concern, competent telephone engineer, one who can design and construct apparatus. Fair salary to right man and excellent chance for advancement. Address Box 558, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 558

WANTED—Position as manager, superintendent or wire chief. Eleven years' experience; good, all-around telephonist. Can take complete charge of from 1,000 to 2,000 subscribers. Address G. W. J., manager Home Telephone Company, Uhrichsville, Ohio. 547

WANTED—A young man with a good electrical education and knowledge of telephone line construction. Should be familiar with locating new pole lines and transmission standards. Work located in Western Pennsylvania. No application considered unless age and salary expected are stated. Address Box 561, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 561

lines out of Peoria which will be finished in the near future. One of the routes extends to Hannah City and Tivoli. Early in the spring a new lead will enter Elmwood and continue on through Yates City and Galesburg to Rock Island, where it will join the lines of the Iowa companies. The Independent business in the counties of Peoria, Woodford, Tazewell, Mason, Fulton, Knox, Stark and Marshall is naturally tributary to Peoria. It is to facilitate the business of the wholesale interests and the owners of the exchanges, especially in the smaller towns, that the meeting was held.

THE FLAG OF THE INDEPENDENTS STILL WAVES IN WASHINGTON, PENNSYLVANIA.

LAST July the State Mutual Telephone Company after being refused a franchise in Washington entered the borough on the poles of another company. The lines were cut down several times and as promptly repaired. In replacing the line over East Beau street a small American flag was attached to the line and Manager T. B. Lee declared that flag would not come down. It is there yet where it was erected. Judge McIlvaine has rendered a decision that the State Mutual was lawfully in the borough of Washington.

COMPARATIVE STATEMENT OF TELEPHONE SITUATION IN OHIO.

PRESIDENT BEAM of the Ohio Independent Telephone Association has prepared a comparative statement of the number of telephones in Ohio, both of the Independent systems and of the Bell system, by counties, which is very instructive.

		INDEPENDENT.				BELL.		
COUNTIES	COUNTY SEATS	Number of Telephones	Number of Exchanges	Number of Toll Stations	Number of Stockholders	Number of Telephones	Number of Exchanges	Number of Toll Stations

Totals,		87,852	240	583	6,481	46,693	88	330

The statement is made up to January 31. At the present time between 500 and 1,000 new telephones have undoubtedly been added to the Independent list, which is growing at the rate of about 500 per month.

The report will make a better showing if Hamilton County's 20,000 telephones are excluded, as the Independent companies have not been able to break into that field and consequently are not in competition with the Bell there. The list of telephones, exchanges, toll stations and stockholders in 30 counties, as shown by President Beam's compilation, is printed herewith. The remainder of the statement, which will be given in detail in a succeeding issue, shows that the Independent companies have in the entire State 227,271 telephones, 695 exchanges, 1,604 toll stations and 18,239 stockholders. The figures obtained for the Bell companies give as totals only 108,991 telephones, 219 exchanges and 842 toll stations.

CLEARING HOUSE COMPANY CHECKS TOLL ACCOUNTS IN IOWA.

TOLL line message business is checked and the earnings are apportioned amongst various Iowa companies by the Independent Clearing House Company, which was organized some time ago for this purpose. The clearing house has secured a suite of rooms at 410 Locust street, Boone, Ia., and has engaged Geo. T. Hewes as manager. Arrangements have been made with a large number of Iowa companies to have their business checked and arrangements are fast being made with others for this same service. The company is now actively engaged in this work.

TELEPHONE COMPANY MUST PAY FOR PRIVATE RIGHT OF WAY IN NEW YORK CITY.

IN a recent unanimous decision of the Appellate Division of the Supreme Court it was held that for every telephone wire strung over and on a person's property, without his consent or license, the New York Telephone Company is liable to the extent of $50 per wire annually. While this decision at present affects only Manhattan and Bronx boroughs, should it be sustained by the Court of Appeals it is likely that it will be extended to the remaining three boroughs of Brooklyn, Queens and Richmond.

This decision was rendered in the vigorously contested suit brought by Ratje Bunke against the New York Telephone Company to recover $200 damages for having strung wires across the roof of his house at No. 327 Pleasant avenue. It began in the Municipal Court, and has gone up by stages to the Appellate Division of the Supreme Court. The proceedings began January 8, 1904.

In deciding the matter the Appellate Division, through Justice Laughlin, all concurring, holds that the evidence was sufficient to show that the telephone company was the owner of the wires running over plaintiff's roof, and that the testimony of an expert that the value of a roof for the purpose of stringing wires was worth at least $100 a year was admissible. It also says that the claim of the telephone company that the wires in question were strung over the roof under a license granted by a prior owner of the property is of no avail as a defense, as, if there was such a license, it was terminated by the transfer of the property to the plaintiff.

Justice Laughlin sums up in this manner:

"It is said that the case is to be precedent for many others. The defendant (New York Telephone Company) has no right to invade private premises and attach its wires to roofs or chimneys without a license from the owner, and it has no right to maintain them after a change in ownership without further license."

When the enormous extent of the plant which is rendered liable to these charges is considered it will be seen that this decision is likely to bring about a substantial reduction in the profits of the New York Telephone Company.

TELEPHONE PATENTS

PARTY LINE SYSTEM.

Arthur F. Poole and Frank B. Hall, of Wheeling, West Virginia, patent (No. 810,345, dated Jan. 16, 1905; filed October 13, 1902; serial No. 127,113) a telephone party line system.

This invention deals with step by step selective apparatus and discloses improvements over former types. Thus the operation of the system is not dependent upon the strength of the selecting currents and the apparatus at each of the substations is operated individually instead of collectively, as is the usual practice.

To accomplish these results a special mechanism is designed which operates in conjunction with a metallic circuit. One side of the circuit is continuous, each substation being provided with a legged connection. The other side of the circuit is looped in to each of the substations and connected to the subscribers's selective apparatus. At each substation this loop is provided with a normally open contact. In the operation of the system these contacts are closed successively until the desired wires may be utilized in connection with a ground return or both wires may be used. On account of the complexity of the arrangements it will be impossible to describe the apparatus and its operation in the space at our disposal, and we would suggest that parties interested secure a copy of the patent.

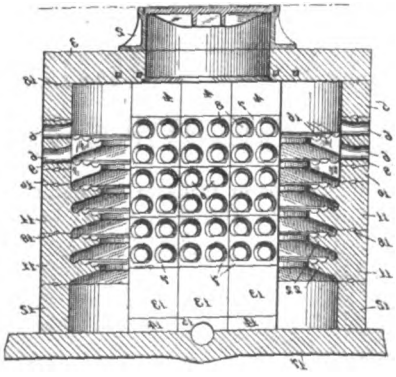
CROSS-ARM CONSTRUCTION.

Oliver C. Allen, Greenfield, Ind., patents (No. 811,895; dated Feb. 6, 1906; filed May 17, 1905; serial No. 260,768) a device for cross-arm construction.

The object of this invention is to provide an improved means for bracing double cross-arms. To accomplish this result the inventor employs a spacing and bracing device which is attached to the ends of the cross-arms. Two pairs of C-shaped members with the upper portions bent at right angles to the vertical part and sharpened into wedge-shaped points, are mounted upon a rod in such a manner that the pointed ends of each pair face each other. The adjustment for distance is accomplished by means of nuts which engage threaded portions of the rod. In application the device is slipped over the ends of the pair of double arms in a horizontal direction. The nuts are then tightened up and the sharp ends of the clamping members are forced into the cross-arms, holding them securely.

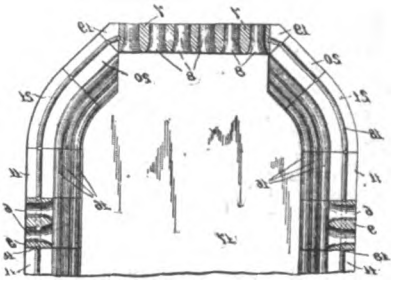
MANHOLE FOR CONDUITS.

Winfield A. Haller, New Orleans, La., and James W. Billingsley, Tivoli, N. Y., patent (No. 810,855; dated Jan. 23, 1906; filed



Feb. 21, 1905; serial No. 246,701) and assign to Edwin N. Sanderson, Brooklyn, N. Y., and others, a manhole for conduits and the like.

The object of this invention is to provide continuous resting places for cables in manholes and especially relates to concrete block construction. For this purpose the walls are built of blocks 11, which are provided with projectory shelves 22, having grooves 16 moulded therein for the purpose of supporting and isolating



each cable. Each of the blocks forming the manhole wall is provided with aligning grooves 18, to enable them to be aligned in both vertical and horizontal directions. In this way the whole structure may be tied together by ransome rods and suitable cement can be applied to fill the aligning holes. Inlet openings are shown at 8 in the form of multiple ducts. If necessary, lateral inlets can be provided at 6. 4, 5, 12, 13, 14 represent solid spacing blocks and 7, 9 the inlet or duct blocks.

RING-OFF DROPS RESTORING MECHANISM.

Ewing McLean, Greencastle, Ind. (patents Nos. 807,575; dated December 19, 1905; filed November 21; serial No. 233,663); a means for restoring ring-off drops on telephone switchboards. This the inventor accomplishes by a combination of levers actuated on the return of a plug to its socket in the plug shelf. A lever extending beneath the surface of the cord table has a hole bored in one end to form in effect a movable plug seat. When the cord is in a jack the rear portion of the lever is tilted down, but the return of the cord to its idle position causes this rear end to rise. In doing so it engages a piece attached to the lower edge of and projecting at a right angle from the shutter of the clearing out drop, which is designed to be mounted at the foot of the panel. Its further movement raises the shutter to the normal position.

POLICE SIGNALING SYSTEM.

Charles L. Foster and P. Kerr Higgins, Los Angeles, Cal., patent (No. 812,733; dated Feb. 13, 1906; filed July 14, 1904; serial No. 216,605) a police signaling system. The essential features of this invention consist of the employment of a system of relays which control lamp or other signals, either visual or audible, by means of which a police officer can be called to the nearest telephone patrol box on his route.

The signals are bridged on a circuit including a dynamo or other source of power to operate them which is open at the contacts of a relay. When it is found necessary to signal a policeman, the operator at the station manipulates switches which cause the lamp signal relay to close its contacts, thereby operating all the signals along the route of the called officer. When the policeman reaches a box and opens it, an automatic switch actuated by the door closes a circuit including a supervisory signal at the exchange, by means of which the operator is notified of the officer's presence at a patrol box. When it is desired to signal the exchange, the normal circuit is so arranged that when the door of a patrol box is opened a line signal is displayed. The operator answers by first manipulating a key which disconnects the line signal and connects the talking set in the circuit.

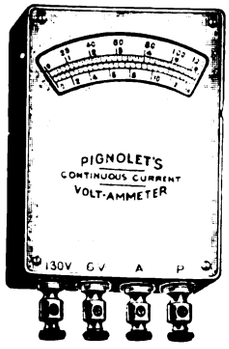
TO BE FOREWARNED IS TO BE FOREARMED



If you are not using a measuring instrument to test your lines, get one at once, as you will need it many times before the summer comes. It would be just as sensible for a grocer to try and sell sugar by guessing at its weight as it is for you to try to locate a fault in a line by the same method. PIGNOLET VOLT-AMMETERS are designed to give the best results required for testing purposes. They are not complicated nor do they require experts to operate them. Another point in their favor is their low cost. There is no instrument on the market which will give you as accurate results at anything near the price. Hadn't you better write for prices and further particulars? By buying one now you will save its cost many times over before you have had it a year.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit

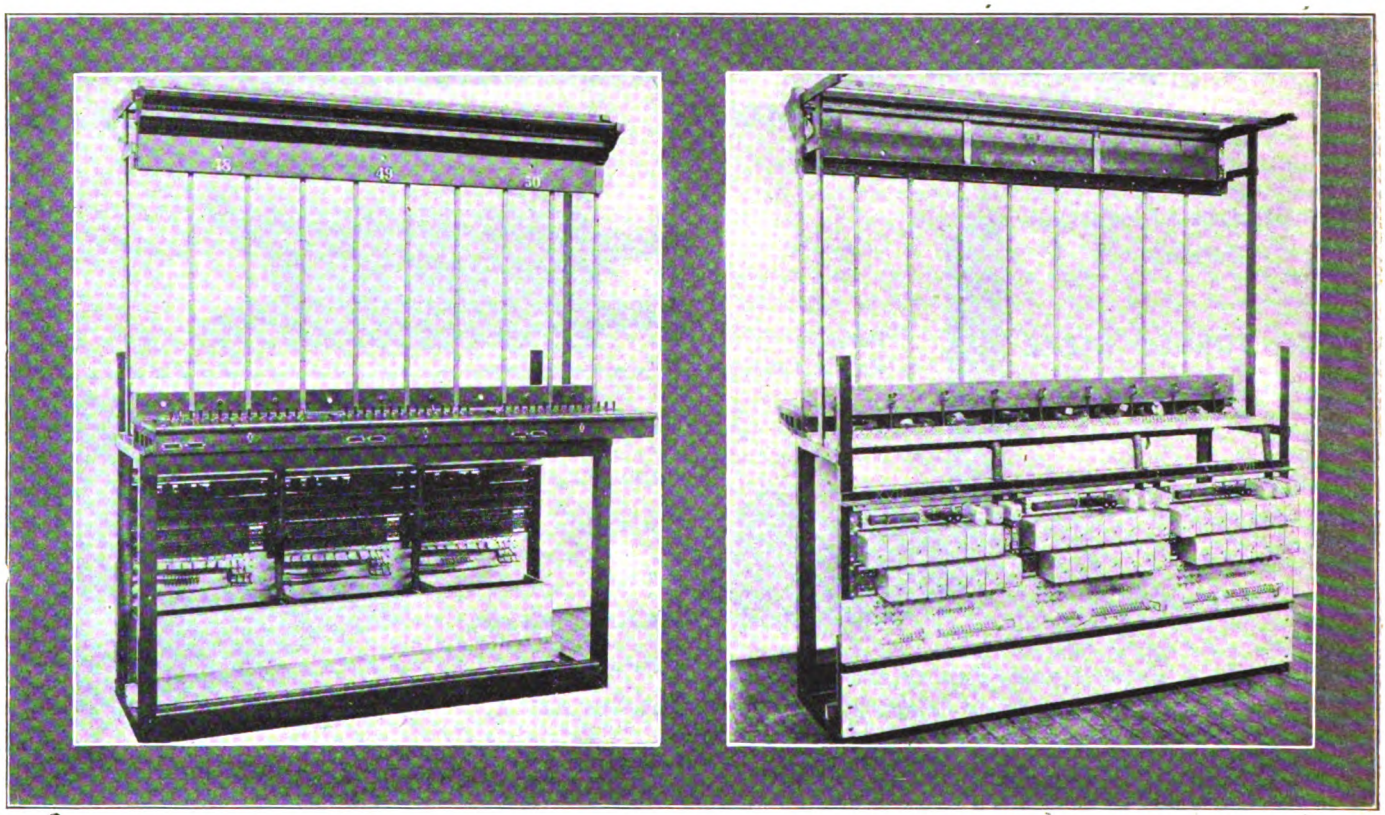
IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

MODERN SWITCHBOARD FRAMEWORKS.

FRAMEWORKS for large switchboards must be so designed that all apparatus and wiring located upon them is readily accessible for removal or repairs, and, in addition to this, must have sufficient strength to support the heavy weight of relays, jacks and wiring with which they are loaded. Upon this page there are shown views of the front and rear of a switchboard section designed for the main office of the Independent Telephone Company at Syracuse, N. Y. This is one of eighteen similar sections, each of which has a capacity of 12,600 subscribers' multiple jacks, 360 outgoing trunk multiple jacks and 450 subscribers' answering jacks.



Front and Rear Views of Framework, 12,600 Line Section of Subscribers' Switchboard, Made by the Stromberg-Carlson Manufacturing Company.

In the rear of the switchboard provision is made for mounting the apparatus associated with the operator's talking set and the supervisory relays in the cord circuit. Below these relays is located the terminal board and all local wiring in the section is brought to this board. The wires terminate upon connecting lugs, which are stamped from sheet brass and carefully tinned where the wires are to be soldered. All local circuits of a particular class are grouped together, in order that the arrangement may not only be convenient for testing but provide for an economical arrangement of cabling. Multiple jacks are fastened to the uprights which rise between these two panels, and the method of fastening is such that any strip may be removed without disturbing any other strip. As all the local wiring in the section is run in while the frame is in the shop, the common wires which carry the battery current to the answering jacks are left coiled above the cord shelf. Thus, when the section is installed it is only necessary to run in the cabling with the jacks attached and solder on the common wires, which are already in place. In this way the amount of time and labor necessary for the installation of a section after it leaves the shop is reduced to a minimum.

Each operator's position is equipped with one of the latest type of operator's breast plate transmitter telephone sets and is also furnished with a complete supervisory pilot equipment, consisting of line pilot, disconnect pilot and ringing pilot lamps. The line pilot has a white opal lamp cap and indicates when a call comes in on an operator's position. The disconnect pilot, having a red opal lamp cap, is used in connection with the supervisory lamp in the calling subscriber's cord circuit. This lamp remains lighted after a calling subscriber has replaced his receiver or flashes if he works the hook in case he desires to signal the operator immediately after having made a call. The ringing pilot has a green opal lamp cap and indicates when an operator rings on a subscriber's line.

A special reflector is supported by standards inserted in the drilling above the position numbers, and this reflector, which runs the whole length of the switchboard, is so arranged as to provide for the correct distribution of light. These sections are made by the Stromberg-Carlson Telephone Manufacturing Company, of Rochester, N. Y. The design is in accordance with the best lines of modern practice in the way of providing for economy of installation and convenience in maintenance, and the workmanship is of the highest quality.

THE FRENCH BATTERY COMPANY, of 69-75 Wells street, Chicago, is introducing a dry battery under the label "Fleur de Lis," which is being manufactured by a process never before utilized in this country and which is said to be giving results which are exceptional. The tests which these cells have been subjected to have brought the strongest endorsements from some of the leading electrical experts, and when the battery becomes widely known

IN THE MANUFACTURING FIELD

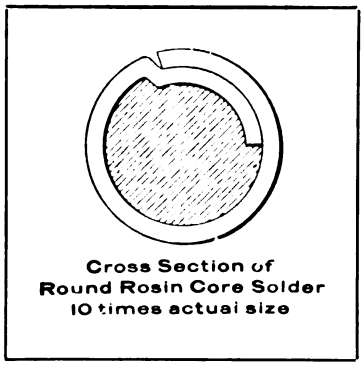
the manufacturers are confident of a large demand for their batteries.

ECONOMY IN SOLDER.

CORROSION of fine wire at a soldered joint is eliminated by the use of a rosin flux when applying the solder. The most satisfactory way to make the joint is by the use of a solder which is rolled up into a small tube, within which the rosin in a powdered condition is placed. Solder of this type is used by telephone companies almost universally. One of the principal difficulties which is experienced in practice is that after being carried about for a time, as it frequently is in the tool bag of an inspector, the seam of the tube, which is unsealed, becomes partially open and the flux filters out from the tube.

The Belden Manufacturing Company, of 194 Michigan street, Chicago, Ill., has designed a method of manufacturing a self-fluxing solder, in which the seam has a wide overlapping surface, so that there is little danger of its spreading. In this manner the waste, which so often reaches an amount far beyond that actually consumed in use, is avoided. The company claims that, in addition to the advantage obtained from the special method of manufacture, the soldering composition used is one which long experience has proved to be absolutely satisfactory for telephone work. The rosin is put in by a special process, so that the tube is compactly filled throughout its entire length. The advantage of a tube which is full of rosin and will stay full will be appreciated by all who have seen the result of attempting to make a firm joint with solder containing insufficient flux.

The company will be pleased to furnish further information to those desiring to use this economical material.



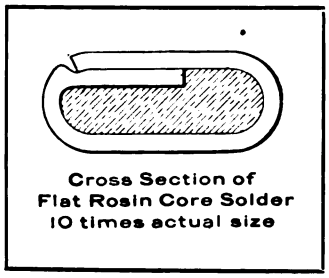
Solder made by the Belden Manufacturing Company, showing seam overlapping ¼ of circumference.

THE SWEDISH-AMERICAN TELEPHONE COMPANY, of Chicago, has recently opened branch offices in Kansas City, Mo., 308 Nelson building, and Omaha, Neb., 615 Bee building. The former is in charge of W. O. Rhode and the Omaha office is in charge of F. M. Ferguson. Both of these gentlemen are salesmen of ability and wide experience and have a wide acquaintance in their respective territories.

COOK GETS ST. LOUIS.

THE order for the complete protector equipment for the new exchange of the Kinloch Telephone Company, of St. Louis, has been awarded to Frank B. Cook. This is claimed to be the largest single order for protective apparatus that has ever been placed in this or any other country, as the new Kinloch rack will be the largest single rack in existence. The order calls for 16,000 pairs of protectors, and the type to be furnished by Cook is a brand new one. Mr. Cook says it is a radical departure, both in principle and design, from any protector now made, and has a great many particularly good points to recommend it. However, as it will take some time to fill the St. Louis order, he is not ready to enlarge on its merits, or to offer it for sale to other exchanges for some time to come. The order was placed by the Stromberg-Carlson Telephone Manufacturing Company.

THE ELECTRIC GOODS MANUFACTURING COMPANY, Boston, Mass., formerly known as the Electric Gas Lighting Company, is mailing a leaflet to the trade drawing attention to the change in its corporate name. Twenty-five years ago when this firm started in business its principal commodity was gas lighting apparatus. It built up one of the largest trades in the country, and its name became synonymous with quality and business integrity. However, of recent years the company has branched out into other lines, and now either manufactures or is selling agent for almost every line of electrical apparatus. Under these conditions the former name of the company had become misleading, and it was therefore decided to change it to one more appropriate. The sign of the four circles is still employed, and this will serve to identify the business until the new title is thoroughly known.



THE INTERNATIONAL TELEPHONE MANUFACTURING COMPANY, of Chicago, reports considerable success in the introduction of its latest "leader," the new permanently adjusted receiver. The furnishing of these receivers to small and large buyers alike at one dollar each has proven one of the best methods that could be adopted for more widely introducing "International" equipment.

SECRET SERVICE IN AUSTRALIA.

THE steamer Ventura, out of San Francisco March 8, will carry a complete equipment of secret service apparatus, to be installed by the Australian Government at Brisbane. The equipment was furnished by the Baird Manufacturing Company, of Chicago.

THE AMERICAN ELECTRIC FUSE COMPANY, of Muskegon, Mich., receives most prominent mention in a paper reviewing the business development of the city which has been recently published. It is stated that the company was incorporated August 13, 1895, with a capital stock of $25,000. It then employed seven people and did a business of $11,000 the first year. During the first eight months of 1901 it gave employment to 250 workmen and did a business of $160,000, or at a rate of almost a quarter of a million dollars a year. The factory was moved to Muskegon during 1905 and now gives employment to between 300 and 400 mechanics. The company has secured from the Rolfe Electric Company, of Chicago, the exclusive right to manufacture the well known Rolfe protective apparatus, and is therefore placing before the trade a complete line of protectors. It maintains in New York City, Atlanta, Ga., and in Chicago sales offices where a complete stock of goods is always carried for the purpose of making quick shipments. It has purchased materials sufficient to insure against delay by reason of inability to secure raw stock, and feels confident that it will be able to give immediate shipment upon all orders for stock goods received.

THE EWING-MERKLE ELECTRIC COMPANY, St. Louis, Mo., is mailing monthly calendar cards to the trade. These are very attractively designed and besides serving the purpose of a calendar also advertise certain specialties the company has for sale. This month the Gyrofan, a new type of electric fan, is illustrated and described. For operating and terminal rooms it is claimed to be superior to the old stationary fan. Further particulars and prices can be secured from the company.

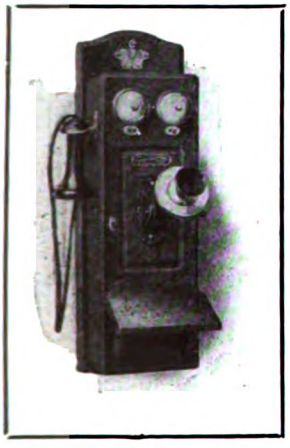
We're from Missouri and you've got to show us

a better telephone than our "New Beauty." Personally, we know you can't; it doesn't exist. Now, we won't be verbose about the wonderful transmitter, or the perfect qualities of the receiver, or the fancy kinks to the generator or ringer, because any one of them isn't the whole thing by a long sight. What we will tell you is, that every part of our telephone is good. That's a plain, unvarnished fact. Now the best thing you can do is to apply the Missouri principle to yourself and we'll "show you." That's fair, isn't it?



Now for your order, big or little. It will be a starter, and we won't worry about the future.

THE WEEK'S MESSAGES

FINANCIAL.

CARBONDALE, ILL.—The Farmers' League & Community Telephone Company, of Carbondale, has increased its capital stock from $2,500 to $5,000.

PECAN, TEXAS.—The North Texas Telephone Company has increased its capital stock from $5,000 to $10,000.

FRANCHISES.

CALISTOGA, CAL.—The Palaside Mining Company has applied for a franchise to construct and maintain a telephone system.

NAPA, CAL.—R. L. Grigsny, of Napa, has been granted a telephone franchise in Hot Springs.

LAMAR, COL.—The Big Bend Rural Telephone Company has been granted a franchise to operate a telephone exchange in Lamar.

FLORA, ILL.—The City Council has granted a franchise to the People's Telephone Company.

HOWARD, KAN.—O. B. Walker has been granted a telephone franchise at Howard.

RUSSELLVILLE, KY.—The Home Telephone Company, of Bowling Green, Ky., has secured a franchise in Russellville. The company will at once begin the work of putting in a plant.

ANAMOOSE, N. D.—W. E. Glotzbach is asking the City Council for a franchise.

LAWTON, OKLA.—W. P. Records, F. H. Miller and F. M. English have applied for a franchise at Lawton.

ECHO, ORE.—The Butter Creek Telephone Company has applied for a franchise at Echo.

TEXARKANA, TEX.—The Texarkana Telephone Company has been granted an exclusive franchise on the Texas side of the city.

CASTLEDALE, UTAH.—R. C. Miller, of Castledale, has been granted a franchise to construct and operate telegraph and telephone lines in the county of Emery, Utah.

CLYDE, WASH.—Messrs. Eilert and Bradburg have been granted a telephone franchise to build a line from Clyde to Lamar.

LATAH, WASH.—The Springtown & Latah Telephone Company has applied for a franchise to construct and operate telephone lines on the roads in the vicinity of Latah.

ROCKFORD, WASH.—The Rockford & Mt. Hope Telephone Company has applied for a telephone franchise at Rockford.

LETHBRIDGE, ALBERTA, CAN.—A. J. Arnold, an attorney of Windsor, has applied for charter for a railway company with powers to operate a long distance telephone line from Lethbridge to Edmonton by way of Calgary and High River, alongside the railroad tracks, and with power to make what connections shall be considered necessary.

COMBINATIONS.

BOSWELL, IND.—F. A. Ross and others have purchased the Earl Park & Raub telephone systems owned by Dickson & Atkins. The lines will be extended and new apparatus added.

DEER CREEK, IND.—J. M. Davis, of Deer Creek, has sold his telephone system to W. A. Miller and Lester Ramsey.

WINCHESTER, IND.—The Eastern Indiana Telephone Company has completed a deal by which it comes into possession of the exchange at Saratoga, with 100 telephones and toll lines to Ft. Recovery, O.

ELECTIONS.

LIMA, IND.—The Lima Telephone Company has elected the following officers: D. J. Cable, president; S. S. Wheeler, vice-president; W. H. Duffield, treasurer; G. Methany, secretary.

EATON, O.—The Eaton Telephone Company has elected the following officers: C. F. Brooks, president; L. D. Leah, secretary; Elam Fisher, treasurer.

MARIETTA, O.—The Marietta & Caldwell Telephone Company has elected the following officers: A. L. Gracey, president; W. H. H. Jett, vice-president; Ralph Wooster, treasurer and general manager; A. C. Davis, secretary.

LITTLE MEADOWS, PA.—The Little Meadows Telephone Company has elected the following officers: A. D. Brown, president; F. A. Johnson, vice-president; W. D. Minkler, secretary and treasurer.

NEW COMPANIES.

COLFAX, ILL.—The Colfax Telephone Company, Colfax, has been incorporated with a capital stock of $15,000. Incorporaters are William Gaddis, J. P. Arnold and F. J. Harris.

MATTOON, ILL.—The Coles County Telephone & Telegraph Company, Mattoon, has been incorporated with a capital stock of $100,000. Incorporators: I. L. Lumpkins, W. G. Lumpkins and John McNutt, Jr.

CUTLER, IND.—The Cutler Co-operative Telephone Company has been incorporated with a capital stock of $4,000. The directors are W. H. Draper, Noah Flank and William Smith.

MANSON, IND.—The Manson Co-operative Telephone Company has been organized with a capital stock of $1,000.

NOBLESVILLE, IND.—The Highland Telephone Company has been incorporated with a capital stock of $20,000. The directors are Albert Craig, Claude Beaver and A. H. Sheffer.

RICHMOND, IND.—The organization of the New Paris Independent Telephone Company has been perfected. The capital is $20,000. The following are the directors: W. D. Rush, Greenville, O.; C. S. Brooks, C. B. Cokefair, L. D. Lesh, Elam Fisher, of Eaton, O.; S. C. Richey and E. O. Dowler, New Paris, and A. C. Lindemuth, of Richmond. Long distance connections will be established and the service improved.

SHIPSHEWANA, IND.—The Mutual Telephone Company, of Shipshewana, has been incorporated with a capital stock of $10,000. Directors: D. A. Platz, Levi A. Kauffman, M. S. Yoder, W. H. Weaver, H. J. Hostetter and D. J. Miller.

TERRE HAUTE, IND.—The Citizens' Independent Telephone Company, of Terre Haute, has been reorganized. A bond issue of $1,000,000 has been ordered, and $200,000 set apart for construction work.

CHICKASHA, I. T.—The Washita Valley Telephone Company has been incorporated with a capital stock of $10,000. The company will build a line from Chickasha to Lindsay.

CHARITON, IA.—The English Telephone Company, Chariton, has been incorporated with a capital stock of $10,000. Incorporators: A. C. Curtis and others.

MIDWAY, IA.—The Midway Telephone Company has been formed with B. F. Taylor as president and J. E. Goldsbery as secretary and treasurer.

ST. LUCAS, IA.—The St. Lucas Farmers' Telephone Company, of Fayette county, has been incorporated.

DONEGAL, KAS.—The Donegal Mutual Telephone Company has elected the following officers: President, R. Nessing; vice-president, H. J. Altman; secretary, L. L. Hoffman; treasurer, A. L. Buck.

EDMOND, KAS.—The Farmers' Mutual Telephone Company has been incorporated with a capital stock of $5,000. The directors are: E. W. Wood, J. P. Paul, John McMullen, E. W. Childers, of Edmond.

EXCELSIOR, KAS.—The Centerville Rural Telephone Company has been incorporated with a capital stock of $1,020.

LONG ISLAND, KAS.—The High Line Telephone Company has been incorporated with a capital stock of $1,650.

CORINNA, ME.—The West Penobscot Telephone & Telegraph Compan, Corinna, has been incorporated with a capital stock of $10,000. The incorporators are C. L. Jones, J. E. Gray, H. B. Rackliffe, C. T. Moses and others.

CLAYTON, MICH.—The Clayton Telephone Company has been incorporated with a capital stock of $1,000.

NEWS—WANTED

THE matter contained upon the Message and Operating Field pages of this paper is contributed largely by our special correspondents. We believe, however, that there are many valuable items of telephonic interest which are never brought to the attention of the public. There is no reason why this condition should exist, and the Editor, therefore, invites all telephone companies and the officials of such companies, to furnish any information that they can consistently make public relative to financial statistics, new construction, elections, franchises and personal items.

OUR MOTTO—QUALITY AND PROMPT SHIPMENTS.

KELLOGG "MICHIGAN WHITE" CEDAR POLES

THE poles we handle are all carefully selected, and are the best grade of stock.

All shipments are prompt, subject only to car supply.

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices.

We have recently published a little book giving some very valuable information about Cedar Poles. It contains Specifications, Inspection Comments, Shipping Data, Etc. "Yours for the asking."

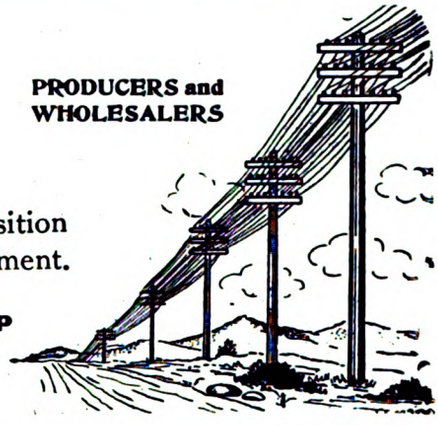
KELLOGG SWITCHBOARD & SUPPLY COMPANY - - - CHICAGO ILL.

PITTSBURG & LAKE SUPERIOR IRON CO.,
ESCANABA, MICHIGAN.

PRODUCERS and WHOLESALERS

WE always carry a large stock of all sizes of White Cedar Poles, and having yards on all principal railroads in Northern Michigan and Minnesota, are in position to make immediate shipment.

"From the Stump to the Line."



CEDAR POLES

Upon a foundation of SQUARE DEALING we have built a pole business excelled by none. Our reputation is of more importance than your order, therefore if you buy from us, you will be assured of getting what you want.

We solicit your orders and can please you in quality and prompt shipments.

THE WEEK'S MESSAGES

RANKIN, MICH.—The Mundy Telephone Company, of Rankin, has been incorporated with a capital stock of $10,000.

OSCAR, MINN.—The Oscar-Trondhjem Farmers' Telephone Company has been incorporated. Incorporaters: O. K. Aalberg, Swen Larson, T. E. Stras and others.

STARBUCK, MINN.—The White Bear Lake Telephone Company, Starbuck, has been incorporated with a capital stock of $8,000. Incorporators are: B. M. Tessenen, H. L. Gorder, J. E. Moin, J. C. Gorder, of White Bear; L. K. Rio, Starbuck, and others.

VIVIAN, MINN.—The Farmers' Star Line Telephone Company has been organized with the following officers: Alex Latourell, president; Louis Kaufman, vice-president; J. P. Kremer, secretary; William Beyer, Jr., treasurer.

BALLWIN, MO.—The Ballwin Mutual Telephone Company has been incorporated with a capital stock of $2,000. The directors are A. A. Weber, Henry Heinemann, Tim Munsch, Edward Blinne and C. L. Shotwell.

HOPEWELL, MO.—A telephone company has been organized at Hopewell, with J. D. Smith, president, and W. H. Wirts, secretary.

LINNEUS, MO.—The Linneus Rural Telephone Company has been incorporated with a capital stock of $5,000. President, Alex Brinkley; E. H. Schrock, secretary.

ST. LOUIS, MO.—The Electric Construction Company, of St. Louis, has been incorporated with a capital stock of $125,000. Incorporators: Max Koehler, C. M. Foster, S. B. Jeffries and others. The new company will construct telephone plants.

SPANISH LAKE, MO.—R. G. Hereford and E. M. Denny are organizing an Independent telephone company at Spanish Lake.

FORSYTH, MONT.—The Forsyth Telephone Company has been incorporated with a capital stock of $20,000. In addition to installing a telephone system in Forsyth the company is to build lines to Miles City, Ashland and other points.

CLATONIA, NEB.—The Farmers' Mutual Telephone Company, of Clatonia, has been incorporated with a capital stock of $1,200. The incorporators are B. C. Albert and others.

HICKMAN, NEB.—The Hickman Telephone Company has been incorporated with a capital stock of $6,000. The directors are Adam Brendle, C. H. Hempel and August Schmitte.

PAGE, NEB.—The Page Telephone Company, Page, Holt County, has been incorporated with a capital stock of $10,000.

ESTANCIA, N. M.—The Board of Trade has taken up the matter of organizing a company for the purpose of building a local telephone line.

ALLEGHENY, N. Y.—The Citizens' Telephone Company has been organized. The organizers are C. L. McGavern and Clair S. McGavern, Allegany, N. Y.

EAST SPRINGFIELD, N. Y.—The East Springfield Telephone Company has been incorporated with a capital stock of $10,000. The company proposes to operate lines from Richfield Springs to Cherry Valley, and also to Cooperstown and along the Mohawk River, and to Sharon Springs. The directors of the company are Henry Rathbon, of Cooperstown; S. A. Young, H. W. Young and O. R. Young, of East Springfield.

MISCELLANEOUS.

FREMONT, IA.—W. D. Dunsmore, of Oskaloosa; H. D. Bell and Mr. Morris, of Delta, have acquired possession of the Farmers' & Traders' Telephone Company. The new company expects to improve the service and extend the system.

TRUMAN, MINN.—The Armstrong Telephone Exchange Company was organized in 1901 with a capital of $25,000. In 1904 the amount of capital was raised to $100,000. The company has recently elected the following officers: John N. Burrell, president; John Robinson, vice-president; R. O. Armstrong, secretary and treasurer.

WINNIPEG, MAN., CAN.—The Canadian Pacific R. R. Company has decided to connect its hotels in the Rocky Mountains with a copper telephone circuit. The work involves the stringing of 126 miles of wire. Address Superintendent of Telegraph Jenkins, or F. F. Busteed, assistant to chief engineer.

PORT ARTHUR, ONT., CAN.—The town will erect a municipal telephone exchange to replace the present building. Address J. McTeigue, town clerk.

ST. JOHNS, N. B.—The N. B. Telephone Company is to build 185 miles of line, from Buctouche to Campbellton.

PERSONAL.

DUDLEY T. COOK has been appointed manager of the exchanges at Ottawa and Olathe, Kas., by the Missouri and Kansas Telephone Company.

FRED COULSON has been appointed assistant construction engineer for the Missouri and Kansas Telephone Company, with headquarters at Kansas City, Mo.

LOUIS GLASS has been re-elected vice-president and general manager of the Pacific States Telephone Company.

A. O. HEDBURG has been transferred from Benson to Morris, Minn., where he has charge of the plant of the Tri-State Telephone & Telegraph Company.

J. P. MARCH has been appointed assistant superintendent of the New Orleans district by the Cumberland Telephone and Telegraph Company.

A. L. SHAW, who has been well known to the telephone fraternity between New York City and the Canadian line during his connection with the equipment department of the Hudson River Telephone Company, has recently accepted a position with the Sumter Telephone Manufacturing Company, of Sumter, S. C.

W. T. VAUGHAN has been appointed manager of the exchange of the Cumberland Telephone & Telegraph Company at Mayfield, Ky.

New Construction in the Field

ROGERS, ARK.—The North Arkansas Telephone Company is stringing a long distance wire from Rogers, Ark., to Seligman, Mo.

STAMPS, ARK.—The Independent Telephone Company, of Stamps, Ark., is to build a telephone exchange capable of accommodating a population of 5,000.

FALL RIVER MILLS, CAL.—The Local Telephone Company, recently organized at Fall River Mills, is to build a line from Fall River Mills to Bartle.

BERTHOUD, COL.—At the annual meeting of the Consolidated Home Supply Ditch & Reservoir Company a committee consisting of C. C. Clark, Will Bader and John Coleman was appointed to confer with the Eastern telephone construction companies with a view to building an independent telephone line along the route of the company's ditch, connecting Berthoud, Loveland and Johnstown.

RIFLE, COL.—The Rifle Creek Telephone Company is to extend its lines to White River.

ATLANTA, GA.—The Atlanta Telephone & Telegraph Company is to have connections with Decatur, Kirkwood, East Point and a number of other points.

WASHINGTON, ILL.—The Washington Telephone Company is to build a line from Washington to Pekin.

HEATH, MASS.—The Heath Telephone Company will soon commence construction work in Deerfield, Conway, Whately, Charlemont, Hawley and Ashfield.

LEBANON, N. J.—The Lebanon Telephone Company is to extend its line from Califon to Fairmount.

ALBANY, N. Y.—The Albany Home Telephone Company has secured new lines to run through Coeymans, Ravena, Indian Fields, Dormansville and Coeymans Hollow.

ASHLEY, O.—The Ashley Telephone Company is to build lines to Marengo, Shawtown and other places.

LORAIN, O.—The Black River Telephone Company, which has recently declared a dividend of 6 per cent, is to extend its lines to the east, west and south of the city.

OSTRANDER, O.—The Ostrander Telephone Company is about to commence the construction of its line.

ROSEBURG, ORE.—The Roseburg, Cleveland & Coles Valley Telephone Company is to build a line from Roseburg to Cleveland, and from Roseburg to Coles Valley.

CHARLESVILLE, PA.—The Friends' Cove Mutual Telephone Company is to construct 27 miles of new line.

CONESTOGA, PA.—The Conestoga Telephone Company is to run a line to Earlville.

KUTZTOWN, PA.—The Independent Telephone Company is to run a line from Kutztown to Kempton.

RIDGEVILLE, S. C.—The telephone system at Ridgeville, owned by P. A. Salvo, Jr., of Charleston, and W. A. Salvo, of Givhans, is to be extended to Mixson.

COLUMBIA, WASH.—The Citizens' Telephone Company, of Columbia, recently organized, is to spend $50,000 in construction work.

Paint vs. Protection.
The life of the average pole is not over ten years. Painting does not increase this limit very much and quite frequently gives a false appearance of stability. If painted after it is set up the most needed point for pole protection is missed, the ground line. Here two distinct forces work for its destruction—the earth and the atmosphere. Poles creosoted by our process are protected not only here but throughout. Let us give you some figures which will show you how to save money.

for you to take up your line construction. If you have decided to erect cable, you will need cable terminals for distribution purposes. In the selection of this apparatus, you should be guarded by the following specifications: The terminal must be efficient, durable, compact, watertight, easy of access and inexpensive.

The one terminal which conforms with these rules is the HALL.

If you have tried others, you will know by looking at the illustration that our claim is good.

No terminal was ever devised which embodies all the good features of this one.

We make it in different types for pole top or side bracket distribution and in capacities suitable for all uses.

Get posted on the HALL CABLE TERMINAL, because it is the terminal that protects.

NORTH'S Solid Back Transmitter combines ample volume, perfect articulation, deep penetration and natural pitch. It reproduces the voice high or low, loud or soft—a loud voice without breaking or blurring.

The full round volume is attained by entirely eliminating dampening springs; there is no unequal pressure on one side of the diaphragm, which is dish-shaped for confining its action to the path of the voice vibrations.

A small amount of polished granular carbon in a specially formed shallow cell eliminates packing.

All parts are made in jigs and tested accurately to a ten-thousandth part of an inch and there are no accidental transmitters in the product.

Just as a precaution, though, they are tested by an engineer before leaving the factory, under conditions approximating actual service.

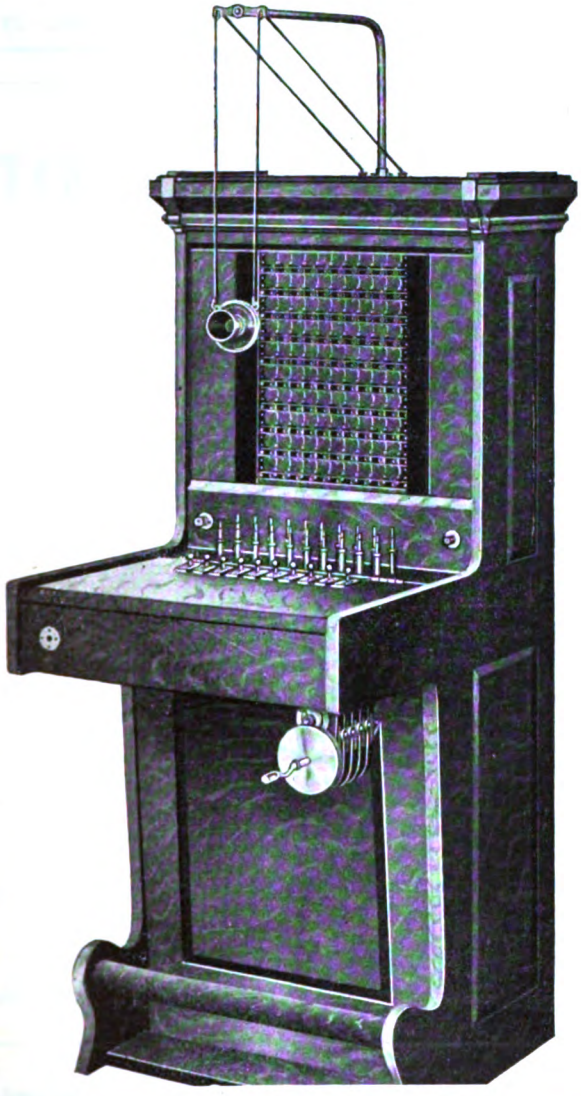
CENTURY

100 % GOOD



PERFECT MAGNETO SWITCHBOARDS

If you are in the market for a new magneto switchboard and wish to give your subscribers the very best service, at the same time reducing your maintenance expenses, it will be to your interest to use a CENTURY switchboard.

Every detail in our switchboards is carefully designed and constructed so as to eliminate all possible chances for trouble.

All parts are so made that they can be readily removed and replaced.

We would like to send you sample drops, jacks and other parts for your inspection, which we will do, charges prepaid. We hope that when you are in the market you will allow us to submit prices to you.

We have a four party selective system that is applicable to any size of magneto exchange.

This system is entirely different from any other in the market.

It has been thoroughly tested and found to be the most practical and economical of any in the market at the present time.

Write for particulars.

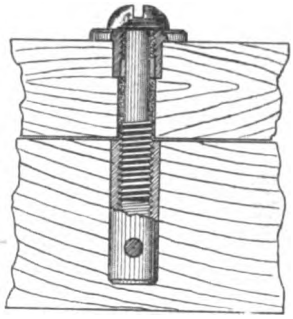
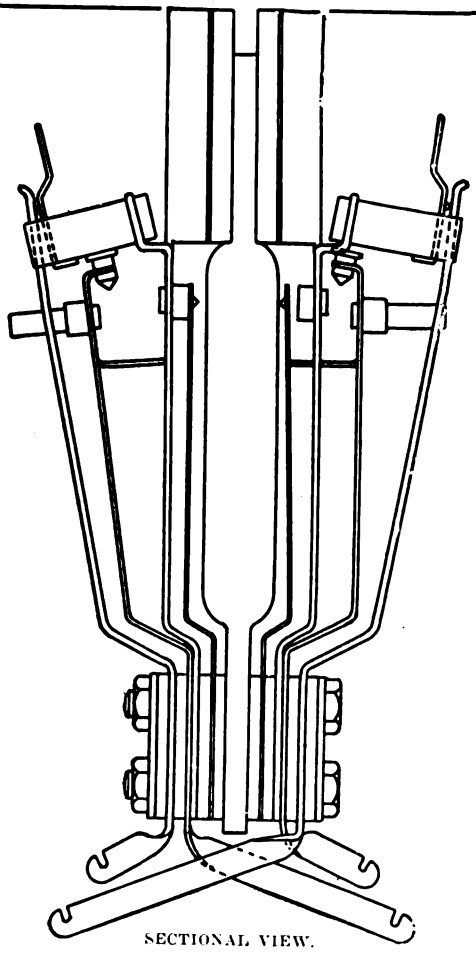
Little Things That Count



Unless otherwise ordered MONARCH TELEPHONES have a door fastening like that shown in the illustration. Two such fastenings are on each door. A machine screw passes through a bushing in the door and fastens in a slightly larger bushing in the box. The threaded portion of the screw being larger than the shank, the smaller bushing keeps the screw from falling out when loosened.

MONARCH TELEPHONE MFG. CO., - - - CHICAGO, U. S. A.



SECTIONAL VIEW.

Cook No. 14 Protector

A Well-known, Well-tried Protector, Wonderfully Improved

TWO HUNDRED AND TWENTY THOUSAND (220,000) of these same heat coils were installed during 1904 and 1905. They are giving perfect satisfaction.

The following exchanges have installed or ordered Cook No. 14 SINCE JANUARY 1, 1906:

Syracuse, N. Y.	6,100	pairs.
San Antonio, Tex.	3,300	"
Bloomington, Ill.	1,950	"
Paris, Ill.	1,380	"
Kansas City, Mo.	1,160	"
Canandaigua, N. Y.	1,000	"
Normal, Ill.	440	"

No bolts or pieces of wire used in transposing line and switchboard terminals (see diagram). No chance of loose connections in the circuit.

When the coil operates, a split spring tightly grips the tip, and prevents its falling into the lower banks of springs.

Lots of other good points that you want to know about. Write and ask. If you're interested, we'll give you a list of engineers and exchange managers who swear by this protector.

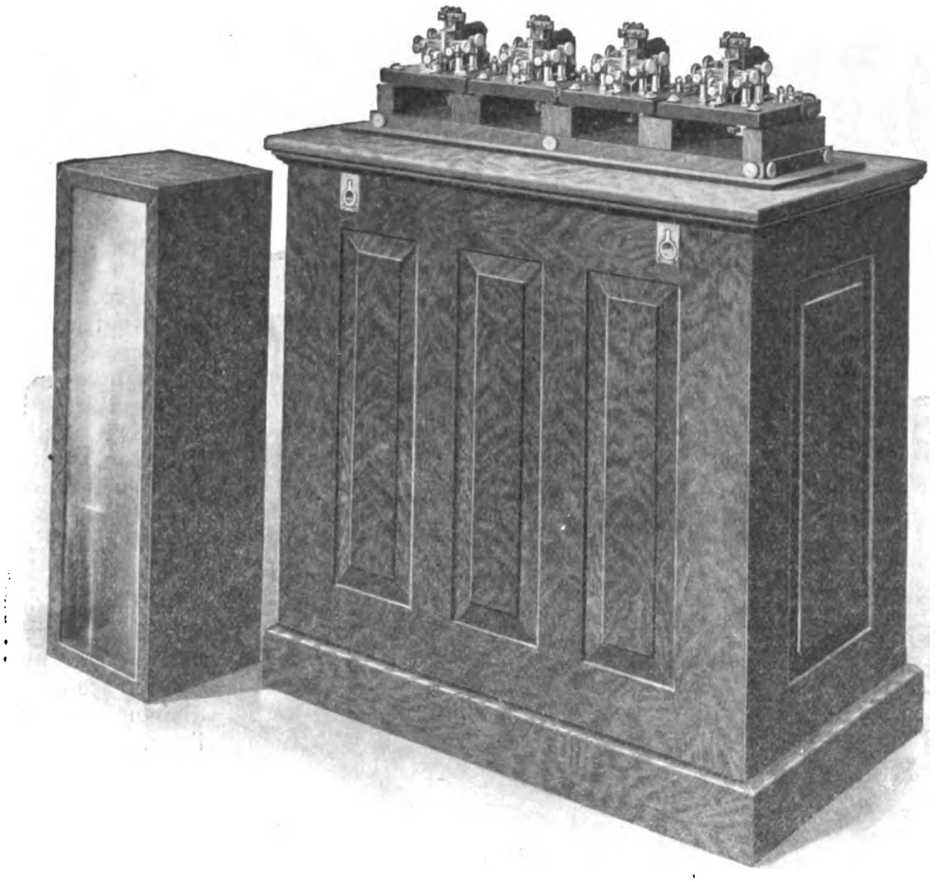
DEAN TELEPHONE APPARATUS



The accompanying illustration shows our Harmonic Converter to which we called your attention in last week's advertisement. It is a new device for supplying alternating ringing current for our harmonic party line system as well as for all regular exchange ringing. Adaptability to any size exchange, reliability and high economy in operation are the novel features.

The Harmonic Converter makes our party line system complete in every detail from the source of ringing current to the absolute non-interfering ring at the subscriber's telephone. We pride ourselves as being the first to produce these results.

The Harmonic Converter shown has its vibrator cover removed. The cabinet is made of finely finished quarter sawed oak and occupies a floor space of 18¼ x 31¼ inches. All of the parts are most substantially constructed and are interchangeable.

These machines are the result of several years of persistent experiments; the difficulty being in producing the proper results economically. They have now long passed the experimental stage—we having a large number in successful operation. Write for Folder No. 5-A, which is descriptive of the Harmonic Converter.

of all the telephone exchanges (both new and replacements) sold in the United States during the past few years have been

OUR AUTOMATIC SYSTEM—BECAUSE

It improves the service; being perfect, prompt and absolutely private, thus supplying a logical reason for advancing rates which have been too low.

It lowers the expenses; costs 50% less to operate and maintain than a manual exchange.

It makes it possible for the operating companies to pay good dividends on their stock, thus

It enhances and steadies the values of telephone securities, making and keeping them a safe, desirable and profitable investment.

Our automatic system adopted in the following cities:

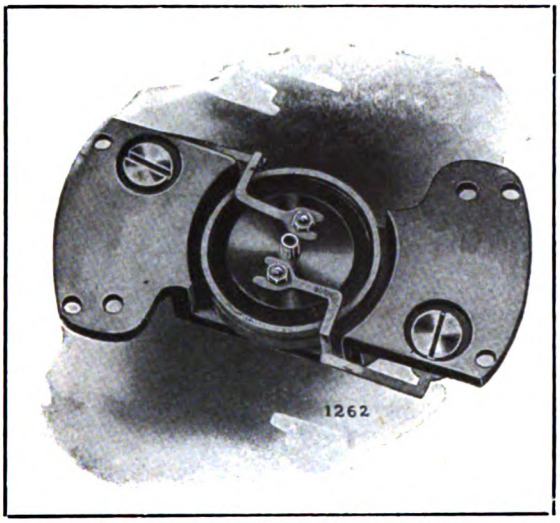
The Stromberg-Carlson Transmitter



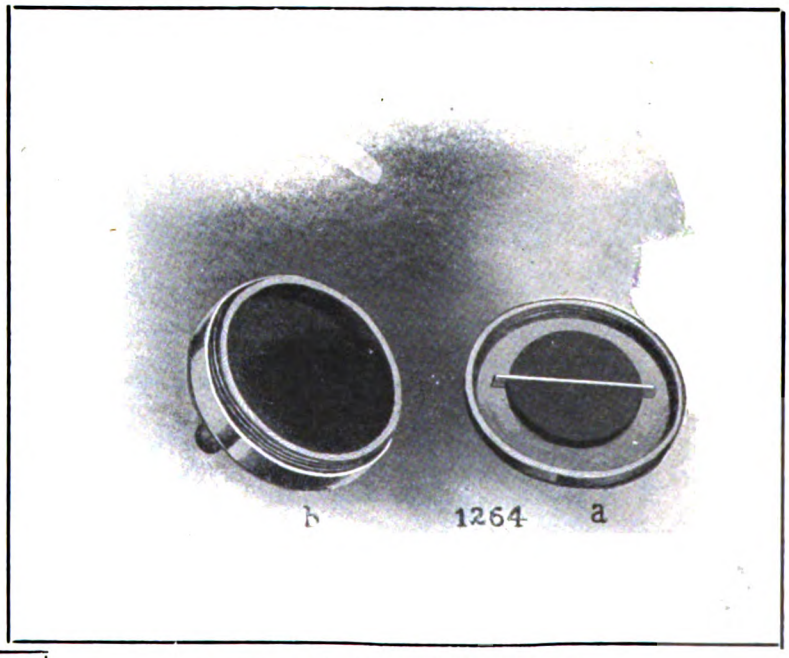
DIAPHRAGM WITH CONNECTORS AND CARBON CUP ATTACHED

Is decidedly different from any other you have ever seen. Different in ways that count for better transmission. This is quite noticeable when the transmitter is used on long distance lines. At a very slight cost you can prove this to your entire satisfaction.

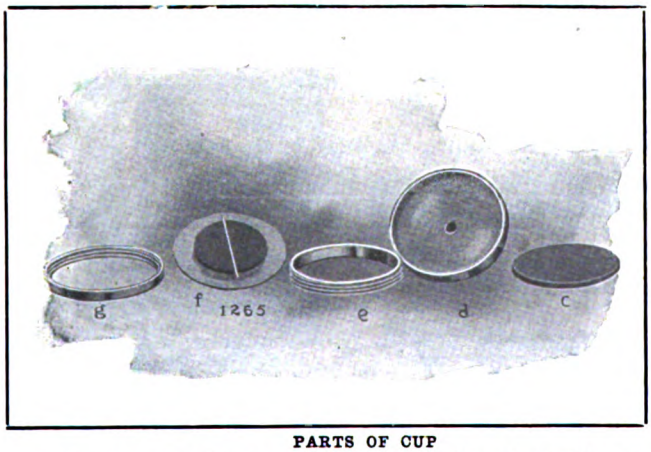
Why not do it?

THE ELECTRODES

Are made of carbon, and both are attached to the central point of the main diaphragm. There is thus produced a variation in the distance between the electrodes of twice the amplitude of variation of the central point of the main diaphragm. It is unnecessary to claim greater volume of transmission than if only one electrode moved.



CARBON CUP WITH CARBON REMOVED



PARTS OF CUP

We give the transmitter such an adjustment that under ordinary tones of voice the volume is not as loud as some of the forms of sensitive transmitters now on the market. As the voice is raised, however, the volume of transmission from the instrument is multiplied two-fold so that the transmission, when talking in a loud tone of voice, has much more volume than that of any other type. The advantage of this is readily seen.

Let us send you our new booklet describing and illustrating this transmitter. It tells the whole story; we mail it free. Just ask for Booklet No. 91-B.

WE MAKE CABLE

Cable Construction by One Who Knows

We append below a letter from C. H. Judson which we know will carry more weight than any arguments we could set forth relative to the merits of cable construction.

MR. C. H. JUDSON.

Mr. Judson's ability and judgment is well proven from the fact that he has been engaged by the following prominent Independent companies as construction engineer:

Twin City Telephone Co. . . . Minneapolis and St. Paul, Minn.
Kansas City Home Telephone Co. . . . . Kansas City, Mo.
Mutual Telephone Co. . . . . Des Moines, Ia.
Independent Telephone Co. . . . . Council Bluffs, Ia.

and is at present acting in a similar capacity for the

Independent Telephone Co. . . . . Seattle, Wash.

Mr. Judson says:

THE INDEPENDENT TELEPHONE CO., COUNCIL BLUFFS, IA.

COUNCIL BLUFFS, IA., May 24, 1905.

STROMBERG-CARLSON TELEPHONE MFG. CO., Rochester, N. Y.

Gentlemen:—In Des Moines, with an average of 1,100 operating lines, in the cable plant during the month of February, 1905, the actual cases of line trouble were 11; six of them being blown fuses and the balance various other troubles.

Of course this was a very rare month, but it shows how much line trouble can be reduced by enclosing all the line wires in cables.

The short open wire plant, which includes the short lines attached to the end of the cables where they run out through from one to four blocks, with one or two pairs, gave considerably more trouble than this, although there were probably less than 100 lines in this part of the plant.

Theoretically the only line trouble that a cable plant can produce is caused by actual damage to the lines, as burning of the cables or the breaking of the cables from extraordinary causes, or the breaking or accidental grounding of the rubber covered drop wires.

Another plant in which there were about 1,800 all cable lines working, showed during a very heavy storm about one-fifth as much line trouble as an absolutely new open wire plant of somewhat smaller size, in the same vicinity.

The situation can be figured out by any Exchange Manager if he will take his trouble sheet and sort it up carefully, setting out in one column the cases of trouble which occur in lines which are all cable, and in another column those which occur on open wire lines.

Very truly yours,
(Signed) C. H. JUDSON.

Have you a copy of our Cable Booklet? Ask for Booklet No. 79-B.

WRITE US TO-DAY

We make it our business furnishing high grade magneto telephones, our goods standing in a class by themselves. None will equal them for exchange or long distance lines. Can furnish you better goods for less money than any other house. Send for catalog.

FARR TELEPHONE & CONSTRUCTION SUPPLY CO.
118-120 W. JACKSON BOULEVARD, CHICAGO, ILL.

Three Differences between our goods and the other fellow's:

Every piece of raw material is selected because of its fitness for the tool or device. We don't take one grade of iron or wood and make it do for anything and everything.

We employ only skilled labor. That means that when a device is constructed, it is right, and there's no guess about it.

And we don't offer for sale a single device that hasn't some points of merit not found in other makes and all good points found in other makes.

Our line is Construction Tools and Hardware. We make everything from a jack screw to a pole-raising derrick.

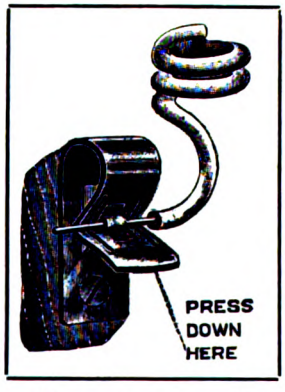
Let us send you our catalogue; you need it.

The Hallett Iron Works

92 WEST POLK STREET CHICAGO, ILL.

Will You Spend 2 Cents to Save Dollars?

If you will, you will send for a sample of the Fahnestock Spring Binding Post, unless you are already using it. The use of the post is not a fad nor a luxury, but a stern necessity. Every telephone company wants to save time, money, labor and trouble. There are very many causes of trouble for which there is no prevention in addition to battery connections. The latter you can eliminate—do away with forever—if you use only those cells equipped with the



Fahnestock Spring Binding Posts.

No more loose, dirty or broken contacts when it is substituted. It was designed to prevent them and it does. When you send in your next order for dry cells, just tell your dealer pretty plainly that you are out to save trouble and that you won't take any batteries that are not equipped with the Fahnestock post. If he needs your trade, he'll ship them at no extra cost.

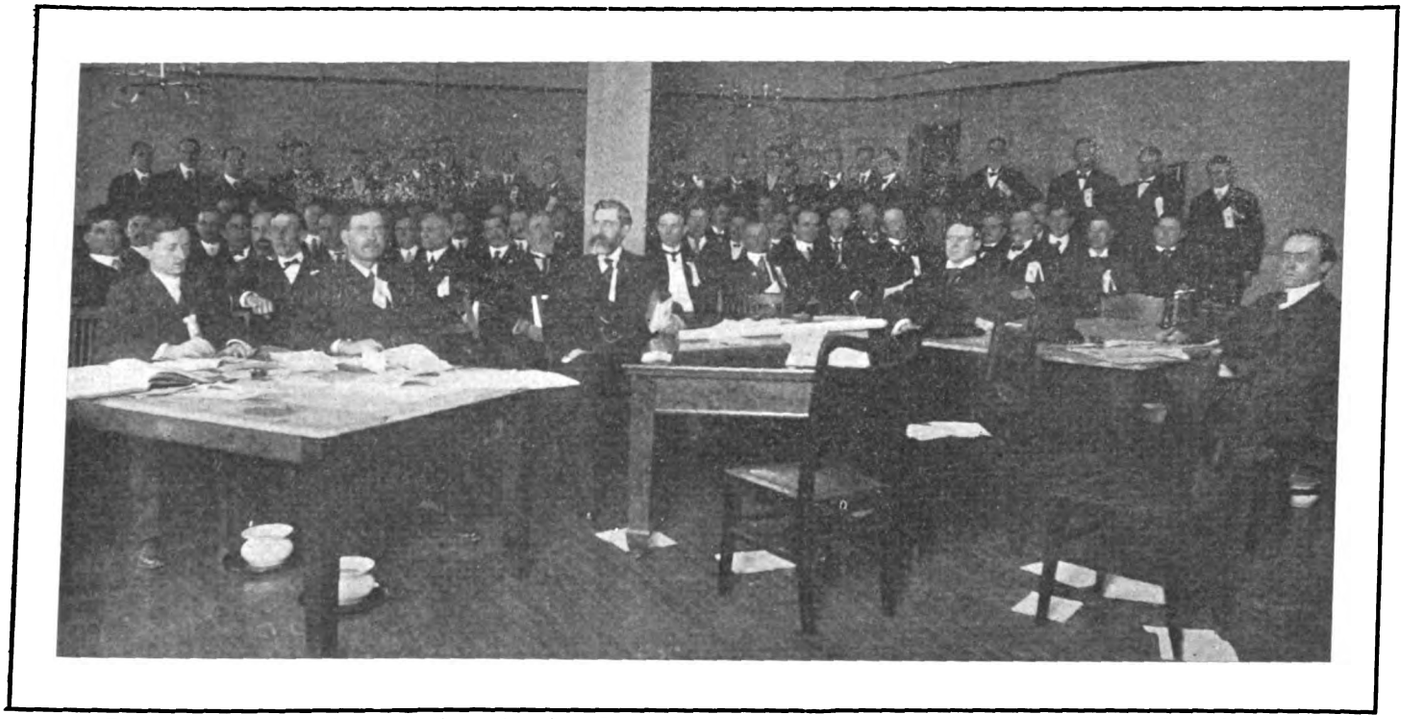
The Parkersburg Convention

By P. C. Garrard.

ATTENDANCE at the first annual convention of the West Virginia Independent Telephone Association exceeded the most sanguine expectations of those who have led in its organization, as there were during the different sessions about one hundred and seventy-five representatives of the various telephone companies throughout West Virginia, as well as of companies in counties bordering on West Virginia in Ohio, Pennsylvania and Maryland.

The association, which prior to the convention was composed of fourteen companies, accomplished at this gathering one of the main points that were desired, and that was to bring into the organization many of the smaller companies throughout the State that had not up to that time been members. Not only do the larger companies realize the strength that is to be gained by organization, but many of the smaller ones realize this as well and availed themselves of the opportunity of getting under the protecting wing of the association.



Delegates and Guests at the Annual Convention of the Independent Telephone Association of West Virginia, Held at Parkersburg.

At the opening of the convention President J. Walter Barnes, of Fairmont, read his annual address. After briefly alluding to the development of Independent systems, which began with the exchange established in 1892 at Clarksburg and grew from this small office into the Consolidated Telephone Company, which now operates in several counties, he stated that there are now eight or ten companies in the State which have a very large volume of business, and these, with their allied small companies, are doing much to cripple the Bell monopoly. He referred to the attempts at organization, which began in 1896, and have finally led to the development of the present strong association. The object of the association he stated to be to form such a union as will more firmly cement the Independent interests, to promote uniformity of operation, construction and equipment and to defend by co-operation the different companies and to give all moral and legal support in any aggressive movement against the common enemy; to procure the enactment of such legislation as will be to the best interests of the Independent companies; to interest home capital and home people; to devise ways and means to protect the companies against the attacks of the opposition and to give such aid by advertisments and maps as may be for the best interests of the Independent operators. He stated one need of the Independent telephone companies in this State to-day to be a traffic association, in order that an equitable division of tolls can be made between the companies for long distance business. Another object touched upon which is to be brought about by the work of the associated companies is the settlement of all disputes according to the rule recommended by the Board of Directors of the National-Interstate Telephone Association, that is by arbitration. The president stated that the Executive Committee has divided the State into districts, so that one member of the Executive Committee of the association is assigned to each district and that all matters and disputes should be filed with him. This member will call in two members from other districts to act with him. The proper dealing with rural lines or mutual telephone companies, the establishment of a committee on legislation and a committee on traffic, and the preparation of a map which will show all toll lines of the different companies with their connections each received consideration in his address.

The president summed up the situation in West Virginia in a manner which admirably indicated the way to improvement and

Digitized by Google

stated in conclusion that "there is everything to encourage us to go forward to meet the competition that we have that is not of the fair, open sort which we like, but is covert and underhanded, even posing under the name of Independent companies in order that it may answer its ends."

The first paper on the programme following the president's address was that of Frank B. Hall, of Wheeling, on the subject of "Standard Construction," which was read by W. C. Handlan, of the same city.

In this paper were taken up the various classes of construction noticeable in use by Independent telephone companies. He suggested that the National Committee be authorized to adopt specifications for the various departments of construction and to adopt a standard of materials to be used. He urged strongly the standardization of construction in order that the Independent telephone system may be brought up to the highest state of efficiency.

Following the reading of the paper Mr. Handlan spoke of the benefits that had been derived by the National Telephone Company, of Wheeling, with which he is associated, in an expenditure of money for a high standard of construction.

He stated that they were able to give excellent service by reason of this between Wheeling and Pittsburg and with many points within a reasonable radius in Ohio.

At the close of the roll call Secretary Davis stated that the members of the West Virginia Independent Telephone Association have 17,271 telephones as against 7,832 Bell telephones in the same territory, the companies having 5,496 miles of metallic toll line circuits.

Representatives present from other telephone companies not in the association who were called upon for remarks were Mr. Doudna, of the Belmont Telephone Company, Belmont, Ohio; Dr. Smith, of Clarington Telephone Company, Clarington, Ohio; Dr. Jones, of the Athens Telephone Company, Athens, Ohio; W. H. H. Jett, Marietta Telephone Company; R. O. Wooster, Caldwell and Marietta Telephone Company; J. W. Marshall, Hartley Telephone Company; W. M. Haynes, Enterprise Telephone Company, New Martinsville.

Under the head of new business, W. C. Handlan offered a resolution, which was adopted, that the telephone companies in other States in counties bordering on West Virginia be invited to become associate members of this association.

A. C. Davis, of Parkersburg, made a motion, which was carried, that the president of the association appoint a committee of three on standardization to act with a like committee of the National-Interstate Telephone Association.

The last order of business for the afternoon was the appointment by the president of the regular committees, which were as follows:

Legislation and Litigation—Frank P. Moats, John A. Howard and A. C. Davis.

Resolutions—W. C. Handlan, J. U. Jolliffe and L. H. Bours.

Nominations—J. H. Lininger, B. J. Farrell and S. E. Billingston.

Standardization—W. C. Handlan, J. W. Downs and A. B. Kratz.

At the Thursday evening session, the address of welcome was delivered by Mayor D. H. Leonard.

The mayor spoke of the reception of the West Virginia Western Telephone Company in breaking the monopoly held in Parkersburg by the Bell Telephone Company. The people did not receive the local company because it was an Independent company alone, but because they felt the company would give them justice. He also mentioned the manner in which the Bell interests fought all movements to start Independent telephone lines in the courts and how these obstacles have been overcome by the energy of just such men as he was addressing.

At the conclusion of the response of President Barnes to the mayor's address the paper of James B. Hoge, of Cleveland, president of the National Interstate Telephone Association, was read by J. H. Lininger, of Harrisville. The subject was "The Future of Independent Telephony," and owing to the inability of the writer to be present, the reading of the paper was assigned to Mr. Lininger.

At the opening of the Friday morning session A. C. Davis, general manager of the West Virginia Western Telephone Company, of Parkersburg, took up in a manner which was much appreciated the matter of territorial rights. In regard to the question of establishing a right to develop territory, he urged Independent companies not to waste their energies by useless competition with other Independents. This involves the companies in difficulties which can only be solved by a proper division of property, which will give to each company the territory which it can best serve. If the companies interested cannot agree, they should select an arbitrator, whose action shall be final, compensating each company for such loss as it may incur. If the companies of larger size find it impossible for any reason to develop the territory adjacent to their systems, they should encourage the organization of a local company to construct lines, giving a fair contract for connection with the larger exchange. If no local people can be found to build up this adjoining territory, he urged that a neighboring company be induced to supply the territory upon a mutual contract for switching subscribers and the exchange of traffic. He closed his address with a vigorous denunciation of those who have betrayed their associates by entering into sublicense contracts with the Bell interests.

The paper on "Switchboard Operation" was prepared and read by E. K. Hertford, manager of the Charleston Telephone Company.

The discussion on this paper was opened by President Barnes, who spoke principally in relation to the wages of telephone operators. In this connection he advocated better pay for the operators and a careful selection of this class of employes.

At the close of this discussion the report of the Executive Committee on a matter that had been presented to them relative to the Burton and Mannington Telephone Company was called for. W. C. Handlan, of Wheeling, gave the report of the committee and in doing so he stated that complaints had been filed with the committee by the Cameron Telephone Company, the Wadestown Telephone Company and the Exchange Telephone Company, of Littleton, that the above company has lines on its switchboard that are not in harmony with the interests of the members of this association.

The committee has investigated the matter and, as stated by Mr. Handlan, the committee has notified the Burton and Mannington Telephone Company that unless it discontinues the connections with the lines complained of that all members of this association will discontinue service with it at noon on March 3. The report was adopted.

At the afternoon session on the second day the Committee on Nominations reported the following names: President, W. C. Handlan, Wheeling; vice-presidents, first district, J. H. Wise, Cameron; second district, W. M. Clayton, Parsons; third district, J. W. Downs, Buckhannon; fourth district, Hugh Amos, Burnsville; fifth district, Lon H. Hutchinson, Huntington; secretary, A. C. Davis, Parkersburg; treasurer, Lloyd Beeghley, Weston.

The officers named were declared duly elected.

The election of delegates and alternates to the convention of the National-Interstate Association resulted as follows: Delegates, Lon H. Hutchinson, W. C. Handlan and A. C. Davis; alternates, A. B. Kratz, E. K. Hertford and L. H. Bowers.

The Committee on Standard Construction was directed to confer with competent engineers relative to specifications for construction for use by companies in this association.

The first paper on the programme for the afternoon was that of W. C. Handlan, of Wheeling, on the subject of "Independent Telephone Securities," which was particularly interesting to the members of the association.

The next paper was read by Lon H. Hutchinson, of Huntington, his subject being "The Ideal Manager."

After all of the business that had been scheduled on the programme of the convention was completed on Friday afternoon President Barnes took occasion to call on a number of the repre-

Digitized by Google

sentatives of telephone companies in adjoining States for remarks. Among those who responded were Messrs. McHenry and Holsher, of the Western Telephone Company of Cumberland, Md.; E. D. Schade, of the Johnstown Telephone Company of Johnstown, Pa.; Dr. Hart, of Pittsburg, superintendent of the long distance business of the Pittsburg and Allegheny Telephone Company; A. L. Gracey, of the Marietta Telephone Company; Dr. F. P. Ames, of the Home Telephone Company of Rockland, Ohio; L. L. Long, of the Mt. Morris Telephone Company of Mt. Morris, Pa., and Mr. Heinlin, of the Belmont Telephone Company of Bellaire, Ohio.

The convention adjourned without naming any place for its next annual meeting, but the call for that meeting will be by the Executive Committee.

As a fitting climax to the convention came the banquet which was given by the West Virginia Telephone Company, of Parkersburg.

Although many of the visiting telephone men had left during the afternoon and the early portion of the evening for their homes, there were about seventy-five who sat down to the banquet table to enjoy the hospitality of the local company.

J. Walter Barnes, the retiring president of the association, who was selected as the toastmaster of the evening, opened that portion of the evening's programme. His selection was a most appropriate one, and he filled that duty in a happy manner that was pleasing to all.

The first speaker introduced was E. D. Schade, manager of the Johnstown Telephone Company, of Johnstown, Pa., who responded to the toast, "Our Emblem." Mr. Schade spoke of the manner in which the emblem can be made popular. "One of the ways," he said, "is to interest as many people as possible in your community to become stockholders of your company.

"Pay annual dividends instead of investing all of the earnings in new equipment and your stockholders will then become interested and will all become solicitors for the company. Our company has tried this with success, and I know that it can be done."

Frank Hart, of Pittsburg, manager of the long distance lines of the Pittsburg and Allegheny Telephone Company, was next introduced and responded to the subject of "Far Away Talks."

Judge C. M. Showalter was the next speaker, who responded to the toast, "The Telephone Girl," and he spoke words of praise of the hello girl that would have done credit to the knights of old.

"The Kicker and the Kickee" was the subject assigned to E. K. Hertford, who said that he would admit that there were times when the public has a right to kick, but in the majority of cases the kick is due from the operator.

J. A. McHenry, of Cumberland, Md., responded briefly to "Our Host," in which he said that he had been much encouraged and would carry words of good cheer back to his people.

"Hot air talks" were indulged in by a number of the representatives of manufacturers, after which there were "cross talks" by a number of others and the programme was closed by A. C. Davis.

Mr. Davis responded to "Our Guests." He said it would not be appropriate to close this meeting without thanking those who had come from adjoining States, as well as from his own State. Prominent business men a few years ago took up the telephone business as a side issue, but they have now become so enthused over its prospects that they are taking an active interest in the business.

Telephone Engineering*

By J. J. Carty.

NOT so many years ago it was thought that the functions of the telephone engineer consisted of doing little more than to provide and install switchboards. He was supposed to be consulted occasionally about the station apparatus, and later, when cables were introduced, his activities were extended so as to include the testing of cable after it had been bought and laid.

J. J. Carty.

At the time of which I speak, telephone companies took almost an exclusively switchboard view of the telephone business. A building would be selected by someone connected with the company and the engineer would be consulted principally as to the selection of the switchboard and the placing of it in position. The size and location of the building, its relation to the existing and probable future subscribers, and all of the vast number of other factors now considered so vital in determining such matters, received but scant consideration. So it was with cables; whether the cable should contain wires of No. 22, No. 19, or No. 16 gauge; whether the insulation should be of cotton, rubber, or gutta percha—these were questions which were as likely to be settled by the purchasing agent as by the engineer.

To one acquainted with the conditions of those times this is not at all surprising, because the telephone engineer of that period shared with all of the rest of the world the prevailing ignorance concerning matters which have since been proved by laborious investigations to be governed by well established laws, the nature of which was then unknown.

Let us take the case of New York City, with the suburban territory tributary to it, and assume that it is the intention of the telephone company to install within that territory a telephone system which will work at a proper degree of efficiency and at the same time yield to the investor a fair return upon his investment; and that it is necessary not only that this condition should exist during the first stages of the project, but that the undertaking should be so managed that this condition will be maintained indefinitely. With such a problem before the telephone management, what part of it should the management require the telephone engineer to work out?

The first question which the engineer must decide is, what is the period for which such construction as may be required should be planned? This is a question of far-reaching importance and requires for its answer that a vast amount of data should be collected, and that careful and long-continued study and investigation should be given to a large number of factors, involving among other things, first cost and character of construction of the diverse portions of a plant of such complicated nature, annual charges such as maintenance, depreciation, and interest, and local conditions bearing upon the possibility of the renewal or extension at some future time of all of the elements of the plant.

In addition to this, due regard must be paid to possible changes in the art and also the fact that, owing to the exigencies of the business, many cases arise where it is necessary to carry out at the beginning, especially in underground work, all of the construction which may ever be needed.

At the outset the question of the period for which to plan depends upon the expectations of growth. With a given expectation of growth, the engineer, by taking into account all of the factors of the case, and balancing the annual charges

*Abstract from paper read before the American Institute of Electrical Engineers, February 23, 1906.

Digitized by Google

resulting from the initial investment against the cost of reconstruction and rearrangement of the plant at some future time, arrives at the economical period for which to plan.

In this work the predictions as to growth are of the first importance and, inasmuch as accurate predictions of this kind are attended with the greatest difficulty, it is essential that not only the judgment of the engineer, but that of the business management and all others who might be able to advise in connection with the matter, should be obtained.

At this stage of the work it is of the utmost importance that the bearing of these estimates of growth upon the future of the plant should be thoroughly understood by the business management, whose functions, in the nature of the case, exercise such a profound effect upon the extent and character of such growth. It is the duty of the engineer to make this point clear and to obtain from the business management serious and responsible estimates of future growth.

The number of lines which may be expected having been agreed upon, the question of how long a period ahead we should plan is determined by a number of circumstances. For such conditions as obtain at New York, the period for much of the construction has been found to be from 17 to 20 years. This figure is arrived at by taking into account a large number of factors, such as life of the central-office switchboard, which is placed at about 15 years, the relative costs of placing in the subways a large number of ducts initially as compared with adding new ducts after a period of about 20 years, the uncertainty regarding the changes in the state of the art, and the difficulty of foretelling with sufficient detail conditions which are expected to obtain during a period so far ahead as 20 years.

Having determined upon the number of lines which form the proper foundation of the study, and having received the proper authorization from the business management to proceed on that basis, the next step is to plot on a map the probable distribution of these lines. This is done, not by giving the location of each line, but by indicating by blocks the most probable distribution. Here again the judgment of the engineer must be assisted and directed by the business management, for next in importance to determining the total number of lines to be provided for comes the question of their distribution.

The number and distribution of lines having been agreed upon, the next step is to determine the number and arrangement of central-office districts, the size and boundaries of these districts and the size and location of the central-office switchboards.

It is conceivable, although obviously impracticable, that all of the lines might be extended to one central office and operated in switchboards there; it is only necessary to state such a proposition to exclude it from further consideration. On the other hand, it is conceivable that a central office might be established in each block; this also is absurd and needs no further consideration. Somewhere between these two extremes must lie the most economical size and number of central offices. The next stage in the problem is to determine this number; to do this no formula, simple or otherwise, is available. The only practicable method is to lay out the territory to be served, in accordance with a number of different arrangements of districts and centres, starting in, say, with 10 centres and extending the study up to as many as 30 or 40, or even more. In the case of all these arrangements there would be certain elements of cost which would not be changed by the different arrangements of central offices assumed. Block wiring and station instruments are examples of these. These elements of cost are omitted from the comparison. All of the items of cost, however, which vary with the different number and arrangement of central offices are computed, all of these being reduced to annual charges.

From these figures, as applied to the various layouts, the number of central offices and the districts which are ideally most economical may be seen. I say ideally most economical for the reason that the practical application of such results requires that a difficult and very complicated adjustment of the existing plant, to conform as nearly as possible to the ideal condition, must be carried out.

Before the switchboard study can be made, general methods of operating must be agreed upon: such as the method of handling toll business, whether it shall be done wholly upon a toll board or partly upon a toll board and partly direct from "A" positions; whether it shall be done wholly upon a "two-number" basis or substantially upon a "particular party" basis. The best method of handling local business must be determined. It must be decided whether the business shall be upon call wires or otherwise; what shall be the capacity of the call wire; what shall be the load which will be assigned to the various operators in the system, this in turn being dependent, among other things, upon the character of the service which it is thought necessary to render.

Having agreed upon these and other fundamental data, the question of the best type of switchboard, whether it shall be full multiple or partial multiple, whether it shall be of the transfer type or otherwise, must be settled. The limit so far as size is concerned of the multiple board, or any other type which may be considered, must be determined. Also there must be settled a very large number of questions cropping out at every point involving maintenance and operating expenses and methods. All of these factors having been duly weighed, the maximum size and type of switchboard is agreed upon.

Of first importance in the cable study is the determination of the standard of transmission which is to be employed, not only for talk between offices within a zone such as Manhattan Island, but also the standard of transmission which it is necessary to maintain between Manhattan Island and the suburbs and between various points in the suburbs passing through Manhattan, and to long-distance points. The importance of this determination will appear when we consider the standard already adopted as the Manhattan standard, which is, assuming the use of the present common-battery apparatus, that the cable employed in Manhattan shall at all times be such that it will give in the worst case a talk as good as could be obtained between two central offices joined by a trunk cable of 10 miles of the standard type having the No. 19 gauge conductors, with a mutual capacity of 0.07. If this standard were lowered, so as to employ the use of No. 22 gauge cable instead of No. 19, it would permit the use of a trunk cable costing half as much as that required by the present standard, thus reducing the number of ducts required and in that way profoundly affecting the results of the study.

The general features of the study having been determined upon and the time having arrived to erect a given central office at a centre previously located, the question of obtaining the necessary real estate and erecting the central office building presents itself. In such cases it is usually impossible to obtain the desired property exactly at the ideal centre. Practical real estate conditions must be met and, of the various parcels of property offered, that is chosen which, taking into account all of the circumstances of the case, results in the lowest annual charges. The distance of a given site from the main subways, the character of the neighboring buildings, the price at which the property can be obtained, the possibility of reconstructing the existing building which may be upon the property or the necessity of removing it and erecting a new one, and other similar points—all these have to be carefully worked out before a report can be made to the management setting forth the most economical land to purchase.

Without attempting to outline in any detail the nature and extent of the work involved in the methods employed in making a suburban toll-line study, and without going at all into the question of methods of establishing the service to long-distance points, I will say that, considering the broad features of these various classes of conditions, it has been found best, in the particular case which I have taken for my example, to divide the telephone business into three classes; local, suburban, and long distance.

In determining what shall constitute the local class the engi-

Digitized by Google

neer finds himself engaged in a problem of great magnitude which primarily concerns the business management and which is affected by important public and economic considerations as well as by engineering factors and methods. If the local zone is made too expensive it greatly increases the magnitude of the trunk-line plant from which no toll revenue can be derived. This fact reacts upon the rates in such a manner as to make it impossible to give as low a station rate as might otherwise be the case. This tends to restrict the growth of stations and hence will act as a check upon the growth of the business at large.

The local zones having been determined upon, it must next be decided what shall be the limits of the suburban business and what shall be classed as long-distance business. Without attempting to explain the various points necessary to be taken into account in determining these questions, I will say that they involve not only those physical factors ordinarily considered to constitute engineering, but that they involve the methods of calling which may be permissible on the part of the subscriber, the entire system of toll rates which may be adopted by the telephone company, the question of whether the subscribers' names and numbers should be listed or not, and other questions of this nature.

(To be Continued.)

Dummy Jack Crosswiring Record System for Distributing Frame

By Volney D. Cousins.

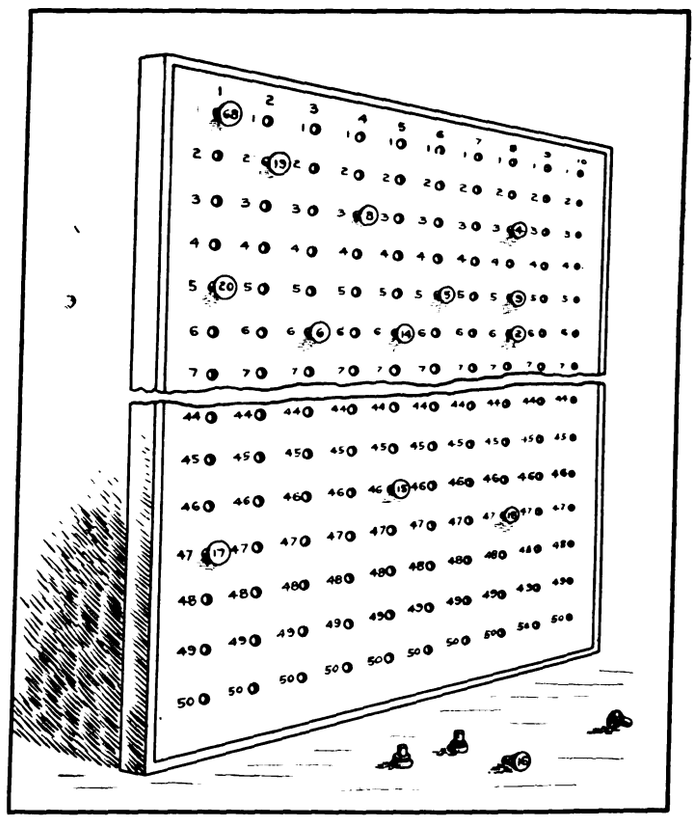
CONNECTIONS on the distributing board in a modern telephone exchange are recorded by the wire chief in accordance with a certain system. Current practice makes use of a ruled book containing two columns of numbers definitely assigned to this use. In one column are placed the numbers designating each pair of cable conductors which enters the office. The other column contains upon the same line with the number of a pair of cable conductors the number of the jack connected to this pair. The numbers assigned to the outside wires are usually stamped, and all erasures and changes which may be necessary are made on the other column.

If the company's business is rapidly increasing, or if subscribers are changing their residences, it falls upon the wire chief to make the changes in cross-wiring as fast as they are sent in from the linemen on the poles. A record must be kept of each change and later entered on the books. Three or four erasures in one place make a hole in the page and an adjacent column must be used. With all due respect to the wire chief, his hands cannot be kept clean during working hours, and his book will show the effect of the wear and tear it receives. If a company is rapidly adding new stations or suffers a gradual shifting of subscribers, the life of a book will hardly exceed a year, and will never show a creditable appearance. The cost of a new book may be small, but its preparation requires a great deal of time.

The dummy jack system, so called from its resemblance to the modern multiple jack, will do away with the old terminal book. This system consists of a set of banks of holes drilled into hard wood or sheet metal, and small plugs to fit these holes. Each bank contains, let us say, 50 holes or dummy jacks to correspond to the 50 pairs in a given cable. Then each vertical row of holes will contain as many numbers as there are pairs in the largest cable running into the office. Set into each hole is a plug containing the number of the telephone line which operates on that pair; i. e., the number of the jack to which the line is connected. These plugs when not in use may be kept in a drawer or separate bank, thus offering a quick method of finding an idle number. An idle pair may be chosen in a cable by a glance from the wire chief's desk. If a pair is in trouble this may be designated by a colored plug, which should be left in the jack until the trouble is cleared.

It is often convenient for the wire chief to know on which pair a certain telephone number operates. Another bank of dummy jacks similar to the first may be installed, each jack representing a telephone number and each plug bearing the cable pair number. In this case there should be a bank for each operator's position.

This system when properly made and installed should last indefinitely. Both sets of banks might be arranged behind a glass door, upon the wall of the exchange near the wire chief's desk. While it may be necessary to use a book for a record of the number of parties on a line, etc., this method will eliminate one of the most undesirable features of the book system and offer the advantage of quick reference. No attempt need be made to make a cost estimate as the system is capable of being very cheaply installed.



Record Board and Plugs. Holes bear numbers corresponding to cable pairs. Plugs carry line numbers.

EXTENT OF THE NEW INDEPENDENT PLANT FOR DETROIT PARTLY DETERMINED.

MANAGER W. B. WOODBURY, of the new Home Telephone Company of Detroit, Mich., in a recent interview stated that plans were being made for a system which would have an immediate capacity for 15,000 subscribers and an ultimate of 30,000. W. C. Polk, the engineer in charge, has already started the preliminary survey, and the actual work of construction will shortly be commenced. One million feet of conduit have been ordered for delivery April 1, and other construc-

Digitized by Google

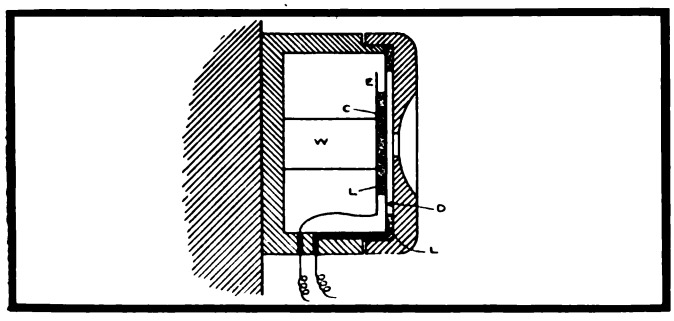
tion material will be supplied to enable the plant to be completed with the least possible delay.

The question of rentals will not be decided until an estimate upon the cost of construction has been submitted, but it is certain that they will be equitable. Mr. Woodbury, until recently, was assistant general manager of the Cuyahoga company in Cleveland, and his experience in that position will prove of great value in the operation of the new Detroit company.

A HOME-MADE TELEPHONE CURIOSITY.

By Arthur Kneisel.

TWO ingenious Kentucky farmers who lacked the necessary funds to join a mutual company built a line of their own. For insulators the necks were broken from medicine bottles and spiked to trees, being held in place by leather washers. The line wire, which ranges from hay bale wire to No. 9, runs for three-quarters of a mile, not a pole being used. The accompanying photograph will give a fair idea of one instrument.



Construction of home-made transmitter.

The receiver and bell were evidently procured from the junk pile of some telephone company. The transmitter, which is entirely home-made, is shown in a sectional view. *D* is a diaphragm, made of the lid of a paint can. L. L. are leather washers, one to hold the diaphram in place, the other to hold the carbon granules, *C*. *F*. is the back electrode, made of a tin lid. The hook is made of a piece of No. 9 iron wire bent double and soldered together part of its length, the two ends forming the prongs. The induction coil, which is also home-made, is wound on the spool of a flax-spinning wheel. Strange to say, the instrument talks.

MEETING OF THE FOURTH DISTRICT OF THE ILLINOIS INDEPENDENT TELEPHONE ASSOCIATION.

INDEPENDENT telephone men of the fourth Illinois district, composed of Iroquois, Ford, Livingston, McLean, DeWitt, Piatt, Champaign and Vermilion counties, gathered at Bloomington, Feb. 23d. for their first convention.

In his address of welcome Mayor J. S. Neville congratulated the telephone men in having cut the rates in two and doubled the service.

Manford Savage, of Champaign, made an address in response, which summed up the benefits conferred upon the country in a manner which makes it one of the most admirable pieces of telephone literature which has ever been composed. This address has been printed and will be distributed by the association.

B. F. Wasson, of Clinton, in a brief address called attention to the problems which the telephone manager has to solve in order to keep abreast with the progress of his business. Talks were also given by J. C. Kelsey, of Chicago, on "The Sub-License Game in Theory and Practice," and by C. B. Cheadle, of Joliet, Ill., secretary of the Illinois State association, who spoke on "Financial Phases of Independent Telephony." The question box was conducted by William Corwin, of Lincoln, and E. D. Childress of Farmer City.

The following delegates were present: W. H. Ramsey, Auburn; F. Y. Hamilton, Bloomington; B. F. Wasson, Clinton; C. H. Coffman, Clinton; C. E. Costley, Weldon; E. D. Childress, Farmer City; F. J. Cutting, Clinton; I. C. Sabin, Clinton; Manford Savage, Champaign; T. C. Bate, G. H. Glass, Pekin; F. M. Kelly, Springfield; H. H. Davenport, Chicago; Wm. Buehrig, Minier; E. M. Ford, Elyria, O.; Wm. Gaddis, Colfax; E. C. Martens, Bloomington; Hart F. Farwell, Bloomington; Maro Farwell, Bloomington; C. S. Hankins, Decatur; W. B. Murke, Decatur; R. C. Critchfield, Minier; Evan Shelby, LaFayette, Ind.; L. F. Hyneman, Lexington; H. A. Ball, Gibson City; H. R. Means, Saybrook; W. W. Lane, Arrowsmith, and C. E. Roberts, Chicago.

MARCH MEETING OF THE PITTSBURCH SECTION OF THE AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS.

ON March 13 telephone men will speak at the meeting of the Pittsburgh section of the American Institute of Electrical Engineers. The members have expressed much pleasure at being able to hear a paper by W. W. Dean, vice-president and chief engineer of the Dean Electric Company, Elyria, O., on "Harmonic Signalling." Five minute discussion papers will be presented by the following gentlemen:

S. P. Grace, chief engineer, C. D. & P. Telephone Company; S. G. McMeen, consulting engineer, Chicago; R. A. L. Snyder, construction engineer, C. D. & P. Telephone Company, Pittsburgh; L. Muhlheizler, superintendent of maintenance, Pittsburgh & Allegheny Telephone Company; M. C. Rorty, superintendent of Traffic, C. D. & P. Telephone Company.

The meetings of the Pittsburgh section have been particularly well attended this year. The institute has secured the use of the new auditorium of the Carnegie Technical School, which is centrally located, and the convenience of this is much appreciated by the members. The students of the Pittsburgh schools have been invited to the meetings, and apparently have been much interested. This meeting, bringing together, as it does, so many of the leading telephone men in the country, is likely to produce most valuable results.

PROPOSED REGULATION OF TELEPHONE BUSINESS IN BRITISH COLUMBIA.

A BILL has been introduced in the Legislature of British Columbia which gives to every person, association or company operating a telephone line the right to connect with the line of any public company, and such public company is to be obliged to receive and transmit messages from any connecting line in the same manner in all respects and with the same rights and liabilities as in the case of messages received by the public company in the regular course of transacting business.

Arrangement of Telephone Made by Kentucky Farmers.

Provision is made for rents to be paid to, and the rates to be charged by the public company for the use of its lines by these private connecting lines, such rates to be fixed by the Government in unincorporated districts, and by the municipal councils in incorporated districts at their pleasure. This is getting down pretty close to Government regulation of rates, and rents may be expected to be as reasonable as they would be under municipal ownership.

QUERIES

DISTRIBUTING FRAME TROUBLE.—(669.)

All our lines coming into the exchange, pass through a ¼ ampere fuse, through a paper wrapped cable, then to a terminal head through heat coils which are to open on 5-10 amperes and thence through another cable to the board.

The other day our board became so noisy that it was impossible to use it. On going up to the cross-connecting racks and terminal head, sparks were seen spitting from between the carbons. In touching the frame I received a shock that sent me to the floor. I looked for the trouble and found that an electric line carrying 6,000 volts had fallen during the storm on one of our wires crossing it and had melted our wire solid to the electric light wire. When we cut the line in question our trouble stopped. Now I would like to know, why did not the ¼ ampere fuse blow open or the heat coil operate. Could this not have burnt out the cable? What could have been the cause of neither fuse or heat coil opening? E. H. C.

The experience which our correspondent details is what we should expect if the ground connection on the main distributing frame were defective. This is evident from the fact that current passed from the frame through his hand and out to ground through his feet.

Under these circumstances there is no reason why the heating coils or fuses should operate as the failure of the carbon arresters to provide a low resistance path to ground for the current from the electric light wire would prevent the operation of any protective devices which depend on flow of current to operate them. The sparking in the carbons noted was probably caused by the high potential to which the frame was charged seeking a path to ground through the electrostatic capacity of the other lines in the exchange.

This experience is a very good illustration of the extreme danger which may arise not only to exchange employees, but also to subscribers by allowing the ground connection of the main distributing frame to become defective.

TROUBLE WITH GRAVITY BATTERIES.—(670.)

In one of our offices we have in use four cells of gravity (bluestone) batteries, upon which a regular froth forms. It is not the ordinary scum as usually seen on this style of battery, but a froth, and has a very strong odor. The batteries will be working all right one night, and the next morning will be "dead." Do you think the water would be the cause of it, as the office is situated in a copper camp? We forward a sample of the water for examination. G. C. H.

Laboratory tests upon the sample forwarded show the following results:

	Parts per Million.
Total solids	339
Ignited residue	257
Volatile (organic) matter	82
Iron	2

There was a color of 55, and the residue showed the presence of considerable amounts of carbonates. The amount of total solids points to a hard water evidently owing its hardness to the carbonates held in solution. This water is evidently a highly colored, hard, surface water containing some organic matter and iron in amounts above the normal.

Considering the hardness of this water and the presence of carbonates, the trouble is likely to be due to the action of the acid formed in the processes of the gravity battery upon the carbonates. Carbonic acid gas would thus be liberated and cause a mixing of the copper and zinc solutions, and hence a destruction of the potential difference dependent upon surface contact only of the solutions. The gas liberated would cause frothing if there were present some organic matter of a nature such as to produce this effect. There were found microscopically considerable fungi (filamentous) present. These often have slimy envelopes about their sheaths, which would easily account for the frothing.

To avoid this trouble it is suggested that the water be boiled with the addition of about one-half teaspoonful of soda to each three or four gallons of the water. The boiling should be kept up for fifteen minutes and the boiled water should then be allowed to stand for 12 to 14 hours until a deposit settles. The water may then be decanted and used. In this way the acid alkaline earth carbonates that are held in solution by an excess of carbonic acid gas will be precipitated and at the same time the water will lose its acidity due to this gas.

CALL COUNTER.—(671.)

Will you please tell me if there is any device for indicating by electrical means the number of calls received on a line where a measured service system of charging is in effect? R. E.

SOME companies use what is known as a service meter. This is an electro-magnetic instrument, which is intended to be operated by the pressure of a button. There is provided one of these instruments for each line. The instruments are all grouped together in the terminal room, mounted upon a rack.

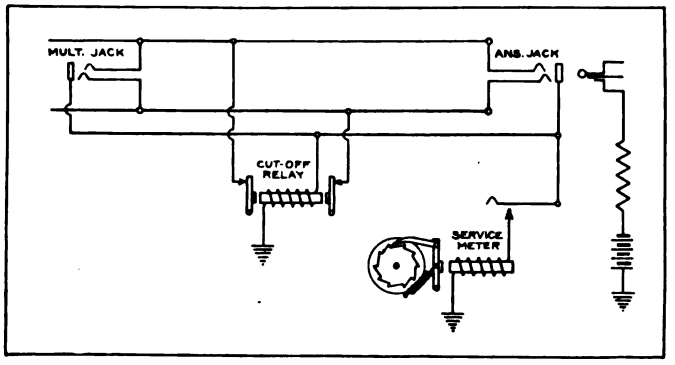

Fig. 671.

Cabling from the meters is run to the intermediate frame, where connection is made with the switchboard circuits. The circuit is so arranged that upon the pressure of a button the current is caused to pass through the service meter coil, and the magnet attracts an armature. The motion of the armature causes the rotation of a disc, bearing figures, through one-tenth of its circumference. Several wheels are provided, each of which bears the figures 0 to 9 upon the circumference. These wheels are geared together, and a complete rotation of the unit wheel causes the advancement through one space of the wheel devoted to tens, etc. The total number of calls for the line in question is thus displayed at all times by the indicator.

In Fig. 671 is shown one of the methods which has been devised for the operation of these signals. With this plan a key is associated with each answering jack at the switchboard. The operator makes the connection called for and, as soon as the supervisory lamp associated with the calling cord is extinguished, she knows that communication has been established, and presses the button of the calling line, causing the wheel to rotate through one division. Another plan provides for the operation of a meter by a key located in the keyboard, and associated with the cord circuit. With this arrangement the meter is connected directly to the sleeve of the answering jack. Although the inserting of the plug in the jack causes the passage of a current from a 24-volt battery through the meter it is not sufficiently strong to operate the device. The pressing of a key in the cord circuit, however, causes a special 30-volt battery to be connected to the sleeve circuit, and the current passing from this through the meter is sufficient to cause the attraction of the armature.

THE EDITOR'S PAGE

MR. CARTY'S PAPER.

RAPIDITY of progress is one of the most striking features in the development of modern telephoning engineering. No more emphatic method of pointing this out could be imagined than the choice for an address by the foremost operating telephone engineer in the world, to be given before the leading body of electrical engineers, of a subject which enables the author to sketch, for their information, the duties of the man responsible for the working of a telephone plant. Engineers in general are just waking up and taking an interest in this distinct branch which has so rapidly come into a position of the greatest importance.

Mr. Carty's paper is likely to serve for a long time as the standard by which outsiders will judge the telephone engineer. To those engaged in the work of which he speaks the treatment of special cases, and the expression of opinions based on his own most useful experience, make the paper one of exceptional interest and value. Amongst these subjects is that of the measured service method of charging, in favor of which he declares in the most unqualified terms. It is only to be regretted that he has not given, for the benefit of telephone men, a more detailed statement of the evils which he has found to be overcome by this policy. The value of careful consideration before taking even preliminary steps toward the construction of a plant is another point upon which he dwells in a manner that reveals the force of his dislike for unscientific and unbusinesslike work. Unavoidable errors of large dimensions, he asserts, are so likely to occur, even when the utmost care is taken, that no information bearing upon a particular case should be left unconsidered.

The discussion of the relation of the engineer to the business management serves at once as an outline of responsibility, and as a suggestion of the need of the most thorough and hearty cooperation between the engineering and business departments. A number of practical instances are given to emphasize this point, and attention is drawn to the fact that a plant which has been designed to provide for economical operation under certain methods of handling business and certain rates, may be very far from the correct thing if the management sees fit to introduce even a slight modification in the original plans.

The pointing out of the breadth of telephone work, and the number of separate classes of knowledge with which some familiarity is essential, is a feature of the paper which must be interesting to men engaged in other branches of engineering. This part of the paper from one who knows the things of which he speaks should carry a useful hint and some encouragement to the younger men who are looking forward to the accomplishment of the most valuable work in their careers.

Hitherto there has been no comprehensive, well stated outline of the duties and responsibilities of an operating telephone engineer, and Mr. Carty's present paper, like others which he has prepared, will take a leading and permanent place in telephone literature.

TOLL LINE SERVICE.

INDEPENDENT toll lines are being extended throughout the country in a way which promises to soon unite all the small companies into a most effective system. Ohio, Indiana and Illinois have thousands of miles of first-class metallic circuits which provide most satisfactory facilities for the transmission of messages between towns in all parts of these states. From these highly developed centers extend lines controlled by the companies operating in these states, or their allies, which lead into many towns in New York, Pennsylvania and West Virginia. In each of these states there are numerous large and well organized companies, which have so thoroughly covered the territory in which they operate that they are able to furnish a great deal of business to the toll lines. Further growth of this branch of the business is well assured. Kentucky is being served by a well developed company, and lines are rapidly being built throughout the South, so that within a short time it will be possible to obtain connection from extreme southern states to Chicago over as good lines as can be built. The secretary of the Nebraska Association has recently announced that in a year's time lines have been built in his state which provide for intercommunication among systems which serve thirty-five thousand subscribers, and the number of persons who can be brought together is being rapidly increased by the building of additional lines. Iowa is served by so complete a system that it has been necessary to organize an association for handling the large business, and the effect of an equitable method of dividing the receipts is sure to give an added impetus to the toll line growth in this state. Fully as significant as the large systems, which give so comprehensive and satisfactory service in the Central States, are the projects which are under way, and which are managed by organizations giving every assurance of the successful termination of their plans, for the rapid extension of long distance service beyond its present limits. The new company which has recently been organized in Arkansas will supply connection between companies in a region which is well developed in a local sense, but where facilities for toll service are greatly needed. Extensions in this direction will interconnect with lines in Texas, which state already has numerous toll lines between its own cities.

Communication from Utah to the Pacific coast is said to be assured through a recent contract which gives Independent subscribers the benefit of lines and rights of way along the Great Western Railway. In the extreme northwestern states Independent development has recently been going on at an extremely rapid rate. Large systems are in operation in the more important cities and towns, and to these are connected a great number of rural subscribers. Those who control these plants are now making arrangements for connection with districts lying to the eastward, and there is every prospect of the speedy development of an extensive Independent system in the western part of the country which will be able to compete on more than equal terms with the toll lines of its rivals.

The value of this work, which is being so rapidly and thoroughly carried on, lies not so much in the advantage of being able to hold an occasional conversation over an extremely long line, but rather in the fact that conversation between a great number of places separated by moderate distances may be had over good lines. Instead of numerous switched connections, each one of which takes time and reduces the efficiency of transmission, it will be possible to obtain connection over from one hundred to five hundred miles by means of direct lines. If these lines are well designed and well constructed, they will give not only the assurance of efficient service for each call, but will also secure to Independent subscribers the other great necessity of freedom from interruption in bad weather. The result of this work cannot fail to be the production of a most beneficial effect upon the industry at large.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

HEIGHT OF WIRES FROM STREET LEVEL IN PENNSYLVANIA.

Will you kindly let me know what the distance is from the level of a street to the height of a telephone line; that is, how high must a telephone line be so as not to interfere with public travel? J. L. P.

THE only regulation that there is on the subject you inquire about is that the telephone line shall be of such a height as not to interfere with public travel. What that height is depends in every case upon circumstances, such circumstances being the road and what it is used for. It is the duty of the telephone company to determine this for itself in each case, and if it has put its line at a reasonable height it will be protected from liability thereby.

UNINCORPORATED TELEPHONE COMPANIES.

Can an unincorporated telephone company put up pay stations along its line? Can a like company take subscriptions from parties not stockholders in the same company? F. H.

IF an unincorporated telephone company can conduct a telephone business at all, it certainly may use pay stations in so doing. Corporations have no greater rights in the transaction of telephone businesses than have individuals. An individual may, if he sees fit, obtain a franchise and conduct a telephone business, and there is no reason why a number of individuals acting together as a partnership, or unincorporated telephone company may not transact business in the same way. It is not necessary that all subscribers to the company become stockholders therein. The stockholders may permit persons not the owners of stock to become patrons of the company, without turning over to them any interest in the company. The answer to both of your questions is "yes."

CITY FRANCHISES UNNECESSARY IN TENNESSEE.

THE Nashville Home Telephone Company, which is compelled to obtain a franchise from the city of Nashville, is said to be considering the feasibility of installing a telephone system in Nashville under a law passed in 1885, which confers on the telephone companies the right of eminent domain. The law may be found in Chapter 8, of Shannon's Code of Tennessee. Two sections of it are as follows :

"1830. Any person or corporation organized by virtue of the laws of this State, or of any other State of the United States, for the purpose of transmitting intelligence by magnetic telegraph or telephone, or other system of transmitting intelligence the equivalent thereof, which may hereafter be invented or discovered, may construct, operate and maintain such telegraph, telephone or other lines necessary for the speedy transmission of intelligence along and over the public highways and streets of the cities and towns of this State, or across and under the waters, and over any lands and public works belonging to this State, and on and over the lands of private individuals, and upon, along and parallel to any of the railroads or turnpikes of this State, and on and over the bridges, trestles or structures of said railroads. (1885, Ch. 66, Sec. 1.)

"1832. In the event such telegraph or telephone companies should fail, upon application to such individuals, railroads or turnpike companies, to secure such rights of way by consent, contract or agreement, then such telegraph or telephone corporations shall have the right to proceed to procure the condemnation of such property, lands, rights, privileges and easements in the manner prescribed by law for taking private property for works of internal improvement. (Id., Sec. 2.)"

It is under this law that the American Telephone & Telegraph Company is operating in Nashville and other towns of the State, the law being specifically referred to in its charter. Some doubt as to the constitutionality of the law has been expressed, and the United States District Court in the case of the East Tennessee Telephone & Telegraph Company v. Greenville, declared the law unconstitutional on the ground that the journal of the House of Representatives did not show that it was signed by the Speaker in open session. The case was subsequently carried to the Circuit Court of Appeals, but dismissed by that court for lack of jurisdiction. The law has never been passed upon by the Supreme Court.

PENALTY FOR REFUSING TO RECEIVE A MESSAGE.

AN action was brought by D. S. Pollard against the Missouri & Kansas Telephone Company to recover a penalty of $200 under the terms of section 1255, Revised Statutes, 1899, relating to the duties of telegraph and telephone companies. The defendant demurred to the plaintiff's petition alleging that it did not state a cause of action. The statute under which suit was brought read:

It shall be the duty of every telegraph or telephone company, incorporated or unincorporated, operating any telephone or telegraph line in this State, to provide sufficient facilities at all its offices for the dispatch of the business of the public, to receive dispatches over and for every telephone or telegraph line, and from and for any individual, and on payment or tender of their usual charges for transmitting dispatches as established by the rules and regulations of such telegraph or telephone line, to transmit the same promptly and with impartiality and good faith, under the penalty of $200 for every neglect or refusal so to do, etc.

The statute originally applied only to telegraph companies, but in 1879 was amended so as to couple telephone with telegraph companies. The court held that the statute was penal, and should not receive a strained construction. The charge was that plaintiff desired to communicate by conversation directly between himself and another person. The court held that this statute did not cover such a communication, but meant a written dispatch delivered by the sender to the agent of the company. Judgment for the telephone company was accordingly affirmed.

Pollard v. Mo. & Kans. Telephone Company, 90 S. W.; 121.

TO LIMIT PARTY LINES TO FIVE SUBSCRIBERS.

THE Louisiana Railroad Commission has proposed a rule forbidding telephone companies from connecting more than five telephones on any party line. The Cumberland Telephone Company has been cited to appear before the Commission when the case will be taken up.

The following is the rule proposed for adoption:

"No telephone company operating in Louisiana shall hereafter be allowed to connect more than five telephones on any party line in cities or towns of the State or on lines running into the country. The rate established by the commission for party line service shall apply only when this condition is complied with. Should any telephone company place more than five telephones on any one party line then the rate for such service for each and every party on such line shall be one-half of the rates authorized for party line service."

IN THE OPERATING FIELD

BILL FOR TELEPHONE RATE REGULATION IN OHIO RECEIVES UNIVERSAL OPPOSITION.

THE House Committee on Cities in the Ohio Legislature has been granting hearings to telephone men on the Hillenkamp bill, which authorizes the councils of cities and villages to regulate and fix by ordinance the price and rate of telephone service every seven years and the granting to such cities and villages of free telephones not to exceed twenty-five. The Independent telephone companies have been active in opposition to the bill and have compelled three hearings.

At the first hearing Clarence Brown, attorney for the Home Telephone Company, of Toledo, and James S. Brailey, president of the company, appeared and addressed the committee. At the second hearing Hon. Harry M. Daugherty, attorney, of Columbus; Frank L. Beam, president of the Ohio Independent Telephone Association, and W. L. Cary, attorney for the Cuyahoga Telephone Company, Cleveland, made arguments against the bill. At the third Frank A. Davis, attorney for the Columbus Citizens' Telephone Company; Judge Gilbert H. Stewart, for the Central Union, and President Richardson, of Indianapolis, representing the Central Union Company also, appeared and urged the defeat of the measure in committee. It is thought perhaps the bill will not be reported back at all, the argument of the gentlemen being conclusive against the proposition.

Many other telephone stockholders and representatives heard the arguments, which created considerable interest and discussion. The general trend of the argument by the Independent speakers was to the effect that such a measure would stifle competition, would corrupt city bodies and would in general tend to more or less successful attempts of Independent and trust telephone companies to unite in many localities and to pool their issues in others. It was stated that the passage of this measure would precipitate fights which would not tend to reduce prices to patrons, but would increase them by increasing the cost of introducing the systems and by wholly preventing systems from entering many cities. It was shown that the condition of affairs in Ohio, where the number of telephones had been increased from forty-five thousand to over the million mark in ten years, is most excellent. That the people are generally satisfied with the rates is shown by the avidity with which they seize on a chance to avail themselves of them and put in the valued improvement.

City Solicitor Northup, of Toledo, is the only advocate of the bill who has yet appeared on the affirmative side, and it is claimed that he is the real author of the bill, the trouble between the city and the telephone companies in Toledo being the ground of his action in the matter. The measure is proving exceedingly unpopular as the people gain an insight into its provisions and the motives behind them.

MANITOBA LEGISLATURE TAKES FIRST STEP TOWARD GOVERNMENT OWNERSHIP OF TELEPHONE SYSTEMS.

THE days of the Bell Telephone Company in Manitoba are numbered. By an almost unanimous vote the Legislature of that Province has decided in favor of municipally owned exchanges, with government owned long distance lines. Application will be made to the Dominion Government for full powers to expropriate the Bell Company's lines and the following resolution to this effect was carried: "It is desirable, in the interests of the people of Manitoba, that the government of the Province should be able to construct or acquire and to maintain and operate a public telephone system or systems throughout the Province so as to insure reasonable charges for the use of telephones and uniform service throughout the Province and the more rapid extension thereof in every portion of the Province. Therefore be it

"*Resolved,* That an humble address be presented to his excellency the governor general and a memorial presented to the honorable the Parliament of Canada praying for the passing of an act amending the act of incorporation of the Bell Telephone Company, and the acts amending the same, removing all such doubts, and providing that the government of Manitoba, when authorized by this House, may lawfully expropriate the property, franchise and business of the Bell Telephone Company or any other company, firm or individual or municipality owning or operating any telephone system in the Province of Manitoba."

This resolution was the result of the visit of the telephone committee of the Manitoba Legislature to a number of cities in the United States. The report made by this committee showed that telephones could be installed and maintained in Manitoba for less than half the price now charged by the Bell Company and even at the greatly reduced figures a handsome profit could be made. It is the intention of the Manitoba Legislature to complete arrangements with regards to the government ownership and control of rates of telephones so as to have the new system working satisfactorily by the next Provincial elections.

GREENE AND WASHINGTON COUNTIES, IN PENNSYLVANIA, TO HAVE COMPLETE INDEPENDENT SERVICE.

EXTENSIVE improvements in telephone facilities in Greene and Washington counties, it is said, are being made by the Pittsburg & Allegheny Telephone Company. Franchises have also been secured in Glassport, Donora, Canonsburg, Waynesburg and Charleroi. A similar ordinance is now before the Council of Monessen. Work has been going on for some time in Waynesburg. At Charleroi the P. & A. will make connection with the Tri-State Telephone Company. The interests identified with the Tri-State have secured control of the Carmichaels Telephone Company, whose principal holdings were in Greene County, and are making extensive preparations to go ahead with the construction of a system that will cover that county completely. The section up the Monongahela River is the only one remaining in Western Pennsylvania which is not tapped at every important point by Independent telephone systems. The P. & A. is already operating a line to Donora. It now sends messages between Charleroi and Brownsville by means of the lines of the Tri-State Company, and it is thought that the gap between Charleroi and Donora will soon be closed. It is understood that Waynesburg will be connected with Washington by a P. & A. line, this giving complete service between the Greene County capital and all the towns in southern Washington County.

INTERESTING EXAMPLE OF INDEPENDENT DEVELOPMENT IN WASHINGTON.

THE Ewartsville Telephone Company, of Pullman, Wash., is owned and operated by farmers on the co-operative plan. This company is now extending and improving its service, and will soon run wires to Pomeroy, in Garfield county. It has 120 miles of wire in operation, and has scores of telephones in the homes of farmers, as well as connection with the business houses of Pullman and Colfax. As soon as the line is completed to Pomeroy it is the intention to extend a line to Dayton and Walla Walla. This extensive telephone system, entirely controlled by farmers, had its origin in a telephone line composed

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE, CHEAP—600 pairs self-soldering protectors. Also one 300 pair and one 500 pair main distributing frame, used less than two months. Will sell separately or together. Address Virden Telephone Exchange, Virden, Ill., or Girard Telephone Exchange, Girard, Ill. 420

FOR SALE—1,800 line, multiple, lamp signal, Central energy switchboard of latest Stromberg-Carlson make. Just from the factory. Not yet unpacked. Terms to suit. Also modern telephone exchange and electric light plant in progressive South Carolina town of over 2,000 inhabitants, $14,000; $3,000 cash; balance on easy terms. Piedmont Electric Co., Anderson, S. C. 563

THE Armstrong Telephone Exchange Company wishes to bond their company for $5,000, and wishes to correspond with any company who is interested in making loans. Address R. O. Armstrong, Secy., Truman, Minn. 568

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

A SQUARE deal is what we aim to render both employer and employee, when seeking the right man for a place, or the right place for a man. Without effort on your part, without endangering your present position, and without using your employers' time, we hunt up the position for which you are best qualified. Let us find the positon for you. Hapgood's, Suite 511, 309 Broadway, New York City. 464

WANTED—By telephone manufacturing concern, competent telephone engineer, one who can design and construct apparatus. Fair salary to right man and excellent chance for advancement. Address Box 558, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 558

WANTED—Two experienced inspectors for central energy system in middle west. Must be hustlers and well recommended. Address Box 564, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 564

WANTED—Practical telephone man desires position as assistant superintendent or troubleman. Eleven years' experience. Best of references. Address Box 560, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 560

WANTED—Continued.

WANTED—Position as manager. Have had 14 years' experience in all branches of the business from the ground up. Past eight years have managed and superintended construction. Married and temperate. Very best of recommendations. Address M., 2119 A, Cass avenue, St. Louis, Mo. 552

WANTED—Position as manager, superintendent or wire chief. Eleven years' experience; good, all-around telephonist. Can take complete charge of from 1,000 to 2,000 subscribers. Address G. W. J., manager Home Telephone Company, Uhrichsville, Ohio. 547

WANTED—Position as manager, exchange 3,000 to 5,000 subscribers; eight years' experience in the Independent field; understand the telephone business from the ground up; competent and reliable. Can furnish adequate references as to qualifications, habits, etc. I will guarantee to "deliver the goods" in exchange management. Address Box 559, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 559

WANTED—Position as manager or wire chief. Have had five years' experience. Am a good all round telephone man. Can give all necessary references. Address, Box 565, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 565

WANTED—Experienced switchboard repairmen for central energy system in Illinois town. State previous positions held and salary expected. Address, Box 566, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 566

WANTED—Wire chief for Central Energy system in middle west; state experience in this class of work. Address, Box 567, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 567

WANTED—Correspondent. Must be able to write strong, forceful letters—the kind that turn inquiries into orders. Experience in dictating telephone and switchboard letters on magneto and non-multiple central energy apparatus necessary. Will pay good salary to right man. Give full particulars. Largest Independent company. Address, Box 562, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 562

WANTED—Chief operator for prosperous Independent company in Southern city. Splendid opportunity for right party. Address Box 569, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 569

of wire fences connecting three farmers' homes with the town of Pullman. The system now is on a firm financial basis, and in addition to paying for the extension of its lines has a snug surplus in the treasury.

EXCELLENT CONDITION OF INDEPENDENT COMPANY AT BELLEVUE, OHIO, SHOWN IN ANNUAL REPORT.

DURING the past year 221 new subscribers were added to the system of the Local Telephone Company at Bellevue, Ohio, making a total of 2,845 telephones in service. These figures were disclosed in the secretary's report, which was read at a meeting of the company held on the 15th of January. This company at the present time owns and operates

Comparative table of telephone situation in 30 Ohio counties. This is a continuation of the statement prepared by President F. L. Beam, commenced in our issue of March 3.

eleven exchanges at the following points: Norwalk, Chicago Junction, New Washington, Berlin Heights, Wakeman, Greenwich, New London, Monroeville, Plymouth, Milan and Attica. In addition to these there are toll stations at the following places: North Monroeville, New Haven, Centerton, Havana North Fairfield, Sulphur Springs, Ruggles, Boughtonville, Pegtown, North Auburn, Fitchville, Florence and Bismark.

A new toll line has been built from Norwalk via North Fairfield and Fitchville to New London and a direct line between Fairfield and New London has recently been placed in service. These toll connections are the completing links in the chain of circuits which unite all the exchanges in Huron County.

PROGRAMME ANNOUNCED FOR IOWA CONVENTION AT DES MOINES.

THE programme for the State meeting of the Iowa Independent Telephone Association, to be held on March 13, 14 and 15, is as follows:

President's address; reports from district organization; "The Best Method of Handling Subscribers' Toll Accounts," by H. A. Douglas, Cedar Rapids; "Better Long Distance Connections," by C. H. Smith, Sioux City; "The Clearing House," by George T. Hewes, Des Moines; "Our Friend, the Farmer," by Dr. Nelson, Dayton; "Care and Maintenance of Equipment," by R. A. Walker, Iowa Falls; "Managers' Experiences," by G. T. Everett, Columbus, Neb.; "Our Needs in Iowa," by E. E. England, Mt. Pleasant; "District Organization," by Chas. C. Deering, Boone; "Toll Service," by Geo. N. Bandy, Des Moines; "A Press Bureau," by Geo. E. Atkinson; "Tactics of the Opposition," by J. H. Shoemaker, Waterloo.

A large attendance is expected and those who visit the convention are assured of a pleasant and profitable session.

OBITUARY.

THE death of Pearl T. Spencer has removed from the ranks of Independent telephone men a zealous worker and a beloved associate. The members of the California Independent Telephone Association, with the progress of which he was so intimately connected, have passed the following resolutions:

WHEREAS, It has pleased Almighty God, in His infinite wisdom, to remove from our midst our esteemed and worthy brother and secretary, Mr. P. T. Spencer; and

WHEREAS, In his death the Independent Telephone Association of California loses a true and loyal member and his family a loving husband, brother and son; therefore be it

Resolved, That we extend to the family of our late brother our heartfelt sympathy in this their sad hour of bereavement; and, be it further

Resolved, That a page be set aside in our minute book for the spreading of these resolutions; and, be it further

Resolved, That a copy of these resolutions be forwarded to the family of our late brother and a copy sent to THE AMERICAN TELEPHONE JOURNAL for publication.

D. S. PARKER, Vice-President.
A. L. ORTON, Secretary.

SPECIAL MEETING OF IOWA INDEPENDENTS RECENTLY HELD TO CONSIDER NEW CONSTITUTION.

BURLINGTON, IA., was the meeting place for forty delegates of the Southeastern Iowa Telephone Association, who came together to consider the adoption of a new constitution conforming with that of the National-Interstate Association. About one-fourth of Iowa, comprising twenty-three counties and having 40,000 telephones in operation, in addition to 1,200 miles of toll lines, is represented by the Southeastern Iowa Telephone Association. The subject of toll lines was discussed in an extremely interesting paper by Geo. T. Hewes, manager of the Independent Telephone Clearing House of Des Moines. The Independent companies of Iowa now have 2,800 miles of toll lines in operation. They are much stronger in Iowa than the Bell Telephone Company. According to statistics given at the meeting, the Bell Telephone Company has but 26,000 telephones in operation in the State, while the Independent companies have a total of 126,000 telephones in use.

In speaking of the importance of Independent companies to Burlington, Mr. Fowler, secretary of the association, said: "The Independent lines are of immense importance to the wholesale houses of Burlington, as it gives them access to hundreds of little towns which the Bell Telephone Company has no connections with. It is well known that wherever a merchant has a telephone he telephones in orders to the larger cities, so the wholesale houses reap the benefits of the extension of the telephone systems.

"In regard to the fight that the Bell Telephone Company is making on the Independent people, it is not scaring us any, as it has been on for several months, and has not done us any damage: instead, we have been increasing right along. The Independent companies are the stronger in Iowa, and will be able to survive any force which is applied by this company."

All Copper Made in 4 Styles

You Never Can Tell

how fast your system will grow. If you are building farmers' lines, you may not see the necessity for more than ten lines and order a switchboard accordingly. Then when the system outgrows the capacity of the board, you have got to get a larger one. Why not save part of the first expense until your are able to get a good idea of the possible expansion by using

THE TRUMBULL DOUBLE THROW SWITCHES

They never become useless, for even after you install a regular board you can find lots of uses for them. Another good point about them is that they can be installed and maintained by anyone. You don't have to know a thing about the small points that are essential in the operation of a regular switchboard, and there is nothing to get out of order. If you are interested, let us know, and we will show you how to make money from the start.

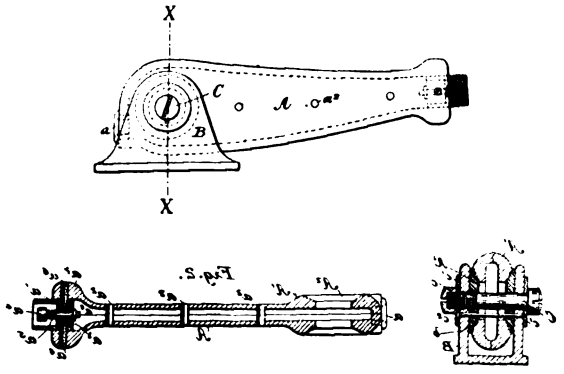
TELEPHONE PATENTS

TRANSMITTER ARM.

William D. Gharky, Philadelphia, Pa., patents (No. 812,125; dated Feb. 6, 1906; filed Mar. 7, 1901; serial No. 50,258) a transmitter arm.

The essential features of this invention consist of designs in manufacture which reduce the cost of production and in the employment of special contact mechanism for connecting the circuit wires to the transmitter. The body of the arm consists of two castings A joined together by rivets. The rearward end is enlarged and provided with exterior concave depressions which terminate in a central opening A^2. The base B is threaded in the usual way to receive a pivot bolt C. Two friction rings b are provided which fit into the depressions of the arm. A pin c^3 pre-



vents the movement of the rings. It will be evident that with this construction much machine work is eliminated as the bearing surfaces of the friction rings hold the arm in position. That end of the arm to which the transmitter is to be attached is provided with an enlargement a^7, to which is fitted a nipple a^1. An insulating block a^3, closing the rear end, is drilled to receive a plunger a^4. A spring a^5 is inserted between the head of the plunger and the insulating block. To the point a^6 one of the transmitter wires is attached; the other being fastened to the nipple a^1. This construction requires a special form of transmitter which is provided with a threaded boss to engage the threads of the nipple. Contact is made with the insulated contact of the transmitter by means of the spring bearing a^4.

SEMI-AUTOMATIC EXCHANGE.

Arthur M. Thomson, London, England, patents (No. 809,232; dated January 2, 1906; filed October 6, 1905; serial No. 281,713) a semi-automatic telephone exchange system. This invention relates to that class of system in which the subscriber causes the number of the connection desired to be visually instead of orally indicated to the operator by mechanical means, the operator not being provided with talking apparatus. Her sole duty is to connect the line of the calling subscriber with the one called. To accomplish this result the subscriber's instrument is furnished with a sending device operated by an electro magnet and clockwork. This sender is provided with individual levers for units, tens, hundreds, thousands. Just above the lever mechanism are openings through which numbers are disclosed so that when a subscriber calls a party before the call is actually sent in the combination of numbers will be in plain sight. Still further above is an oblong opening through which a set of printed instructions can be made to appear for the guidance of the party calling. These instructions may read as follows: "Exchange called, Call received, Engaged (busy), Please speak," and it will be apparent that they conform to the general terms used by an operator in handling a call in the usual way. At the exchange the subscriber's line terminates at the usual jack and is provided with a signal, such as a lamp. Numerical indicating devices are provided which the operators attach to the calling line to ascertain the desired number and connection is made by a modified form of the usual cord circuit.

The operations involved in securing a connection are as follows: The subscriber arranges his sending levers until the number desired appears in the openings above mentioned. He then winds up the clockwork mechanism by means of a crank, and in so doing closes a circuit to ground which causes the line lamp at the exchange to be illuminated. The operator then connects to the line the signal receiving mechanism and causes the instruction annunciator to display the sign "Call received." The introduction of the receiving apparatus causes mechanism within the subscriber's sender to operate and circuits are completed which cause the several figures of the number desired to be disclosed through an opening in the front of the signal receiver. Should the operator be in doubt after removing the receiving mechanism from the circuit as to the exact number desired she can restore the connection of this mechanism to the line and cause the number to be again recorded. The number of times this act can be repeated depends entirely upon the stored up energy of the clockwork mechanism, the arrangement of the sending levers not being disturbed. If the line desired is busy the operator causes the "busy" sign to be disclosed at the subscriber's instrument, and when the party desired is ready to talk, the "please speak" instruction appears.

Ringing is accomplished automatically by inserting the plug in the jack of the called party and a similar signal is simultaneously given to the calling subscriber. Supervisory lamps indicate the completion of a conversation in accordance with the usual practice on manual boards. This is a brief outline of operating features of the system. The invention requires 19 sheets of drawing and 35 separate diagrams to illustrate the mechanism, therefore we would suggest that all parties requiring a more detailed description secure a copy of the patent.

TELEPHONE POLE.

James M. Perdue, Matthews, Ga., patents (No. 811,435; dated Jan. 30, 1906; filed July 11, 1905; serial No. 269,244) a telephone pole.

The essential feature of this invention consists in the employment of sectional members which can be fastened together to secure any height of pole desired. For this purpose the inventor employs a plurality of rods which are held in position by means of head and foot plates. The sections required for the top and bottom of the pole are specially designed for that purpose, the intermediate sections being alike. The top plate of the top section is provided with means whereby an extension shaft carrying cross-arms can be securely attached to it.

In the process of assembling the various sections are joined together by hinged couplings so that when the structure is being taken down the operation of disengaging one member from a lower can be more readily accomplished by allowing the upper section to hang downwards while the pivot pin of the hinge attaching it to the section below is being withdrawn.

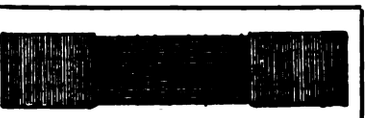
Becker Cable Terminal Head

SUREST, SAFEST, LIGHTEST AND BEST

These terminal heads are made on scientific principles from specifications of the most experienced telephone engineers. No part is slighted to save expense. Reasonable in cost. Spider wires are allowed plenty of space and do not cross fuses. Rubber gaskets between lid and terminal head. Solid brass castings with which to make joint between cable and terminal head. Fuses of novel construction and placed directly above wide brass ground plate, making a practically absolute protection against lightning, trolley or electric light current.

Can be used for both a pot head and fuse terminal, as we equip each terminal head with a screw plug at the top to permit of same being filled with cable compound, if desired. Our method of construction, however, does not make this necessary, as the "Becker Terminal" is made moist-proof. The distributing terminal connections are square-head nickeled brass screws that pass *through* the spring clip which holds the fuse, entirely *through the iron case,* insulated with hard rubber bushings, being threaded and held firmly to position by brass nuts on inside, and are drilled to admit the wire from the cable, soldered connections being made direct to screw. This form of construction positively prohibits any turning or loosening of contacts.



No. 1 "Central" Patent Fuse used in Becker Terminal Head.

There are other reasons why you should use this Cable Terminal. Let us have a talk about it. Write to-day.

Makers of High Grade Telephone Apparatus and Accessories

GOOD OPERATING AND GOOD STOOLS ARE INSEPARABLE

Every manager is constantly endeavoring to increase the speed and efficiency of the service. Did you ever stop to think how much depends upon the comfort of the operators? Sitting in front of a switchboard eight hours a day is no snap, and when the seat happens to be one of the old style lumbering affairs made out of wood it's no wonder that a girl gets tired before the day is over. What is required is a seat that is flexible, one that automatically adapts itself to the movements of the operator and which instead of being an instrument of torture will be restful. In short a

Chicago Metal Frame Operator's Chair

This is the only stool made which solves the seating problem. Independent back and seat adjustment. Seat revolves without changing the height. Flexible back. Extreme lightness. Extremities of legs provided with rubber feet to insure quietness. These are some of the most striking features which will appeal to you. There are others which we can tell you about. Write to-day.

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

CONSTRUCTION APPLIANCES.

ECONOMY and security are the two things most necessary to obtain in hanging cable. Any device which will hold the cable firmly in position, which does not deteriorate too rapidly on exposure to the weather, and which enables the cable to be rapidly fastened to the messenger wire, deserves the most careful consideration from telephone men.

The Yonkers Specialty Company, of Yonkers, N. Y., claims that its Metropolitan Cable Clips hold cable securely, and will last as long as the supporting strand. The company makes two types, which are clearly illustrated in Fig. 1. It will be seen that with both types of hanger shown in this photograph, after the clips have been placed upon the cable practically only a single movement is required to place them on the messenger wire and clamp them. Once they are in position, the strain of the cable is said to lock them so securely in position that no displacement is possible. For pole line work the cable is run out on temporary supports with either hooks or cable blocks, and the clips are applied from a chair which runs along the supporting strand. This work can be done quickly and accurately, and a uniform sag in the cable suspension secured without difficulty.

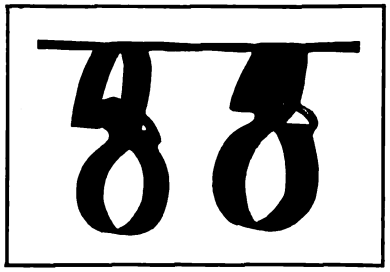

Fig. 1. Types B and A of the Metropolitan cable clip.

The steel wire loop shown in type A is heavily galvanized. The band which encircles both the cable and the supporting strand is of zinc. A high degree of durability is claimed for this combination. In the type B clip especial attention has been devoted to the preparation of a hanger for aerial cable which shall fulfill the requirements of cheapness and durability in a high degree. The simplicity of this hanger enables the company to offer it at a low price, and, as it is constructed entirely of zinc, it does not deteriorate from rust. In hanging cable with this type of clip the hooks which engage the slots should be bent up tightly, either with the fingers or by means of pliers. The bend of the zinc strap over the supporting strand should be made so that the lower loop, through which the cable is run, will be drawn tightly about the cable. This adjustment is easily and quickly made, and a firm suspension is secured.

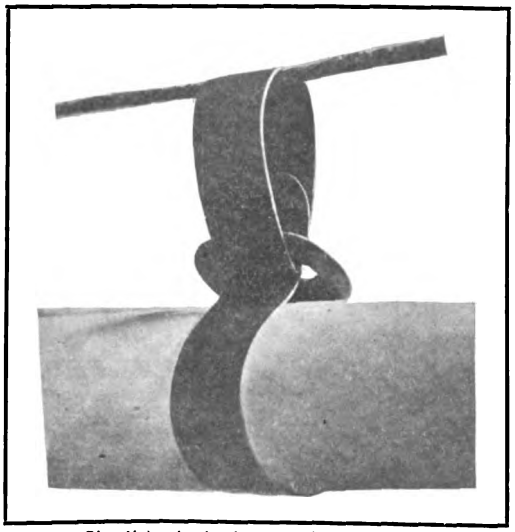

Fig. 2. Simplicity is the feature of the Metropolitan clip, type B.

Another appliance which has been widely used, giving a high degree of satisfaction, is the New York Wire Connector. In Fig. 4 the construction of this extremely useful piece of apparatus is clearly shown. The basis of the device consists simply of a brass stud carrying a slot to receive the wires. Two washers, which have a bar across the middle to engage the slot, are provided for clamping the wires. The screw which engages the thread on the inside of the stud clamps the combination securely together. In installing the main line wire is placed at the bottom of the slot; next a washer; then a branch wire upon which is placed the second washer. The form of the washers is such that ample bearing surface is secured, as when the screw is forced into the stud it not only causes the wire to bind against the washers, but exerts sufficient pressure to cause the firmest contact to be made between the outside circumference of the stud and the inner surface of the washers. As the bearing surface is so large a firm pressure can be exerted upon the wires without danger of injuring them, and yet, on account of their small size, the connectors may be readily taped if it is desirable.

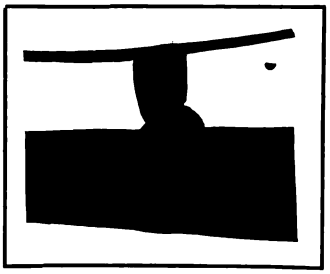

Fig. 3. Type A. The greater the strain the stronger the grip.

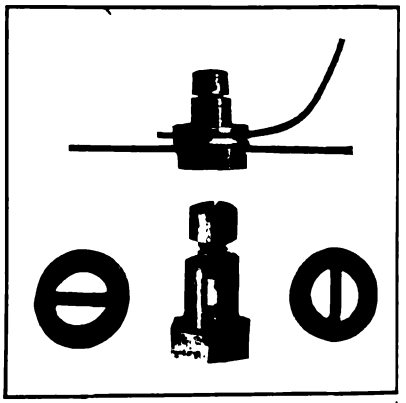

Fig. 4. New York wire connector, separated and in use.

THE FAHNESTOCK ELECTRIC COMPANY, manufacturers of the Fahnestock double diaphragm transmitter, and the well-known Fahnestock spring binding post, has removed from 132 Havemeyer street to 129 Patchen avenue, Brooklyn, N. Y. It is now located in larger quarters, which will enable it to more conveniently handle its business, which has been rapidly increasing.

THE WESCO SUPPLY COMPANY, St. Louis, Mo., has issued the first number of Vol. 5 of its publication "The Live Wire." In this issue a number of interesting articles are presented, including one upon trolley history in Texas. In the department devoted to new things there are descriptions of a live wire indicator, a new telephone which dispenses with the use of one hand to hold the receiver and a new armature winder. A photograph of the sales force of the company is also included, together with several pages devoted to descriptions of apparatus which the company has for sale. This magazine is issued once a month and will be sent to any person interested free of charge.

THE GRAY TELEPHONE PAY STATION COMPANY, Hartford, Conn., has recently issued a catalogue of toll equipment for public and measured telephone service. In it is described every type of automatic coin collector manufactured by the company, together with a line of registers for private or party line, and public pay station equipment for street installation. Twenty-one different models of automatic pay station equipment are shown; the list including coin collectors to meet any require-

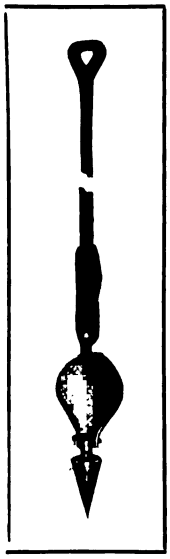
ments. The Gray registers are intended for use on measured service circuits, and combine a visual register and signal by means of which the operator is informed when the call has been recorded. Five different types are shown, one of which is operated by electricity and is designed for common battery circuits exclusively. The catalogue is excellently arranged and illustrated with numerous half tones. Each piece of apparatus is fully described and accompanied by a net price. All parties interested in pay station service are requested to send for a copy.

A NEW GUY ANCHOR.

ILLUSTRATIONS of an improved guy anchor are shown upon this page. This is a new type of the well-known D. & T. anchors, made by the D. & T. Anchor Company, La Crosse, Wis. Two sets of blades are provided to give a double grip and greatly increase the tension which may be put upon the device when installed. The form of the blades when folded is approximately conical, which has been found to give the anchor exceptional driving qualities.

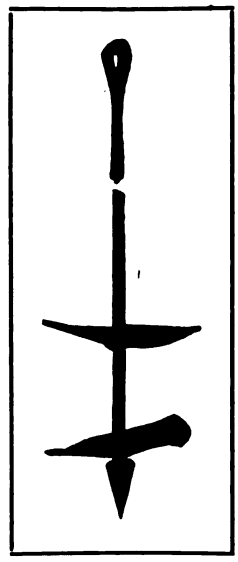
THE SUMTER TELEPHONE MANUFACTURING COMPANY, Sumter, S. C., is distributing to its customers bulletins Nos. 38 and 39. The former number is devoted entirely to a description of the Mason lightning arrester. This arrester differs essentially from any other on the market, in that the line wires are wound around the carbon ground block in a square formation. On account of the high self induction which this construction offers to the passage of high frequency currents, and the number of points for the dissipation of the discharge, the manufacturers claim this to be the safest ever devised. Bulletin No. 39 deals with telephone apparatus. In the preface the company emphasizes the fact that every part that enters into a complete telephone is manufactured by it, and therefore it is able to give an unqualified guarantee. Six types of wall instruments are shown for magneto service, besides the standard common battery set and desk instrument. Two separate pages are devoted to descriptions of the transmitter, receiver and generator, and the other parts also are dealt with fully. The latter part of the bulletin is devoted to general information of interest, and includes descriptions of the more common causes of troubles and their remedies. Illustrations of the right way to make transpositions, to connect up series and bridging telephones, and to install batteries are included. These bulletins contain, besides convincing arguments relative to the different prices of apparatus, much general information, which greatly adds to their value. All parties desiring copies should send their names at an early date.



D. & T. Anchor, ready to drive.

THE STERLING ELECTRIC COMPANY of Lafayette, Ind., is installing 1,800 lines additional switchboard capacity for the Toledo Home Telephone Company, Toledo, Ohio; 300 additional for the Lima Telephone Company, Lima, Ohio; 300 additional for the Home Telephone Commany, Joplin, Mo.; 300 additional for the Newark Telephone Company, Newark, Ohio; 300 additional for the Cedar Rapids & Marion Telephone Company, Cedar Rapids, Iowa; 150 additional for the Bloomington Telephone Company, Bloomington, Ind.; 150 additional for the Canton Home Telephone Company, Canton, Ill.; 150 additional for the Home Telephone Company, Elkhart, Ind., and 150 additional for the Stephenson County Telephone Company, Freeport, Ill.

JOHN A. ROEBLING'S SONS COMPANY, Trenton, N. J., has recently issued a booklet entitled "Some Roebling Products." In it the various uses for the products of the company are illustrated with attractive half tone engravings. These include cableways, rigging, elevator ropes, suspension bridge cables, long span transmission lines, cable supports, messenger wires, pole guys, telephone wire, both iron and copper, trolley wires and all kinds of insulated wire, besides wrenches and other tools. The company maintains branch houses and agencies in New York, San Francisco, Chicago, Cleveland, Atlanta, Los Angeles, Seattle and Portland, Ore. Inquiries should be addressed to the nearest agency.



D. & T. Anchor, expanded.

THE EWING-MERKLE ELECTRIC COMPANY, St. Louis, Mo., is mailing the February issue of the Everbest Magazine. This magazine is published monthly and is devoted to things electrical. In the current number part one of the seventh lesson upon the physics of the incandescent lamp is given. In it the theory of light due to vibration of the ether is explained in a simple and interesting manner. Other articles of interest are "Commercial Co-operation" and "Mechanical Vibration." A copy of this issue will be sent to all parties interested free of charge.

THE WIRE AND TELEPHONE COMPANY OF AMERICA, Rome, N. Y., has recently issued bulletin No. 100, together with a binder in which successive numbers can be kept for convenience and reference. This company was organized for the purpose of manufacturing bars and insulated copper wire for electrical purposes, telephone apparatus and supplies, and also to act as consulting and contracting engineers for telephone systems. In the bulletin under consideration the business of the company is ably set forth, special attention being given to the details of organization and manufacture. Great care has been exercised in the publication of this preliminary number. The paper, type and general arrangement convey a dignified and business-like impression, which will be appreciated by all who may receive a copy. The company is at present in an exceilent position to furnish material upon short notice, and will be pleased to furnish quotations, together with the above-mentioned bulletin and binder to telephone companies interested.

THE MONARCH TELEPHONE MANUFACTURING COMPANY of Chicago reports that it is again in a position to make prompt shipments of telephones and switchboards. On January 1 of this year the Monarch Company increased the size of its factory, and changed the location of the different departments. The departments are now settled in their new quarters, and the output is rapidly increasing so that it will soon be almost twice as much as it was last year. The customers of the Monarch Company who have been delayed slightly during the past few weeks will now be able to secure their goods with the usual promptness.

THE PERU COMMON BATTERY LOCK OUT TELEPHONE MANUFACTURING COMPANY has been incorporated. The company proposes to manufacture and sell a patented device that locks party lines against all eavesdropping by patrons. Marke P. Boone, F. H. Griswold and Joseph Andres of Peru, Ind., are the incorporators.

FINANCIAL.

STAR, ILL.—The Star Telephone Company has increased its capital stock to $25,000.

MAJENICA, IND.—The Majenica Telephone Company has increased its capital stock from $10,000 to $25,000.

RICHMOND, MASS.—The Richmond Co-operative Telephone Company has increased its capital stock to $3,000.

BENZONIA, MICH.—The Benzie County Telephone Company has declared a dividend of 7 per cent.

CONSACKIE, N. Y.—The Coxsackie & Greenville Telephone Company has declared a dividend of 10 per cent.

WAYNE, N. Y.—The Wayne-Monroe Telephone Company has declared a dividend of 1½ per cent.

AUSTIN, TEXAS.—The North Texas Telephone Company, of Pecan Gap, Delta County, has filed an amendment to its charter increasing its capital stock from $2,000 to $10,000.

BONHAM, TEXAS.—The Texas Telephone Company, of Bonham, has increased its capital stock from $20,000 to $30,000.

FRANCHISES.

LAKE BUTLER, FLA.—S. H. Mallory, of Lake Butler, has been granted a twenty year franchise to operate a telephone exchange at Lake Butler, also in the surrounding country.

ADAIRVILLE, KY.—Dr. Smith, representing the Home Telephone Company, has secured a telephone franchise at Adairville.

RUSSELLVILLE, KY.—J. E. Zeluff has secured a telephone franchise at Russellville, Ky.

GREENFIELD, MASS.—The Heath Telephone Company, of Heath, has been granted a telephone franchise in Greenfield. The construction of the line will commence at an early date.

BUTTE, MONT.—F. H. Stow, of Portland, on behalf of the Home Telephone and Telegraph Company, has applied for a telephone franchise at Butte.

GREAT FALLS, MONT.—Frank H. Stow, of Portland, representing the Home Telephone and Telegraph Company, has applied for a franchise at Great Falls.

PLYMOUTH, N. H.—The Baker's River Telephone Company, of Warren, has applied for a telephone franchise in Plymouth.

SPOKANE, WASH.—Application has been made by the Spokane Bridge and Liberty Lake Rural Telephone Company for a franchise.

SPOKANE, WASH.—The Valley Prairie Telephone Association has plied for a telephone franchise at Spokane.

MILTON, W. VA.—The Milton Telephone Company, of which J. H. Harshbarger is president, has applied for permission to construct and operate a telephone system in Milton.

MEXICO CITY, MEXICO.—G. K. English and R. H. Dickey, of St. Joseph, Mo., are applying for a franchise to build and operate a long distance telephone system in Mexico. These gentlemen represent a syndicate of American capitalists.

COMBINATIONS.

ATLANTA, GA.—The Fairview Telephone Company, owning and operating telephone lines in Hamilton and Tipton counties, has purchased the rights and property of the Atlanta Telephone Company in those places.

VIOLA, WIS.—The Union Telephone Exchange at Viola has been sold to the La Crosse Interurban Telephone Company. The La Crosse Company is to rebuild the exchange and put in a complete new system.

ELECTIONS.

IROQUOIS, ILL.—The Iroquois Telephone Company has elected the following officers: Charles A. Calkins, president; Curtis Miller, secretary; Sol. Meyer, treasurer.

HOME CITY, KAN.—The Home City Mutual Telephone Company has elected the following directors: C. A. Batterson, E. H. Tangeman, E. W. Zimmerling, C. Noller, W. B. McGrath, James Cooper and John Hartman.

LOUISVILLE, KY.—At the annual meeting of the Independent Long Distance Telephone and Telegraph Company held in Wilmington, Del., in February, the following directors were elected: John A. Armstrong, J. D. Powers, Chas. J. Doherty, Donald McDonald, S. S. Adams, Jr., C. C. Bickel, J. W. Irwin, E. M. Coleman, C. L. Hughes, George W. Lewman, C. D. Knoefel, Matt O'Doherty, Ed. L. Barber.

LOUISVILLE, KY.—At the annual meeting of the stockholders of the Louisville Home Telephone Company held at Wilmington, Del., in February, the following directors were elected: John A. Armstrong, Charles J. Doherty, E. M. Coleman, C. C. Bickel, J. D. Powers, George W. Lewman, C. L. Hughes, W. C. Garland, J. G. Gray, C. D. Knoefel, Donald McDonald, Matt O'Doherty, Ed. L. Barber.

PENN YAN, N. Y.—The Keuka Park Telephone Company has elected the following officers: President, James H. Pepper; vice-president, E. B. Knight; secretary and treasurer, Fred Culver.

ARCADIA, O.—The Arcadia Mutual Telephone Company has elected the following officers: President, G. W. Dick; vice-president, M. O. Heistand; secretary, A. L. Anderson; treasurer, E. B. Bish.

FREMONT, O.—The stockholders of the Home Telephone Company, at their meeting at Fremont, elected the following directors: T. M. Brush and A. E. Lord, of Elyria; A. W. Overmyer, of Lindsey, and S. Brinkerhoff, J. M. Sherman, E. M. Russell and James Hunt, of Fremont.

CONESTOGA, PA.—The Conestoga Telephone and Telegraph Company has elected the following officers: Henry Hertzler, president; Jacob Heartz, superintendent and manager; Stephen Mast, treasurer.

MONROE, PA.—The Monroe Telephone Company is to be reorganized. The following officers were elected: J. S. Schoonover, president; W. A. Erdman, secretary-treasurer, and B. L. Hursh, manager.

OAKFIELD, WIS.—The Oakfield Telephone Company has elected the following officers: President, A. J. Zielke; vice-president, George Day; secretary, W. E. Bristol; treasurer, C. H. Moore; superintendent, T. E. Worthing.

BURGESSVILLE, ONT., CAN.—The Burgessville Telephone Company has elected the following officers: President, H. E. Scruis, Burgessville; vice-president, J. G. Carless, Burgessville; secretary treasurer, H. Sneath, Woodstock; managing director, Martin Emigh, Holbrook.

NEW COMPANIES.

VALMEYER, ILL.—An Independent telephone company has been formed at Valmeyer with the following officers: Henry Volhardt, president; E. J. Lee, Jr., secretary. The lines of the company will connect with the Farmers' Fountain Telephone Company of New Hanover.

WHITE WALNUT, ILL.—The White Walnut Telephone Company has been organized. The officers are: E. F. Logan, president; Chris. Schmalriede, secretary; Herman Pulke, treasurer.

FISHER'S SWITCH, IND.—The Highland Telephone Company, Fisher's Switch, Ind., has been incorporated with a capital stock of $2,000. Directors: Claude Beaver, W. Beaver, C. Sachs, Thomas McCarthy.

HIGHLAND, IND.—The Highland Telephone Company, of Highland, Ind., has been incorporated with a capital stock of $20,000. The incorporators are Albert Craig, Claude Beaver and A. H. Shaffer.

SHIPSHEWANA, IND.—The Shipshewana Telephone Company has been incorporated to build an exchange and telephone system in Shipshewana and Legrange County.

FORT ATKINSON, IA.—The Farmers' Mutual Telephone Company, Fort Atkinson, Ia., has been incorporated with a capital stock of $2,500. President, C. D. Horton; vice-president, L. T. Huber; secretary and treasurer, J. A. Huber.

HONEY CREEK, IA.—The Honey Creek & Southwest Telephone Company has been formed. G. W. Cronbaugh, president; Wm. Schraeder, secretary. The company will build lines from Koszta to the adjoining country.

NEWS—WANTED

THE matter contained upon the Message and Operating Field pages of this paper is contributed largely by our special correspondents. We believe, however, that there are many valuable items of telephonic interest which are never brought to the attention of the public. There is no reason why this condition should exist, and the Editor, therefore, invites all telephone companies and the officials of such companies, to furnish any information that they can consistently make public relative to financial statistics, new construction, elections, franchises and personal items.

OUR MOTTO—QUALITY AND PROMPT SHIPMENTS.

KELLOGG "MICHIGAN WHITE" CEDAR POLES

THE poles we handle are all carefully selected, and are the best grade of stock.

All shipments are prompt, subject only to car supply.

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices.

We have recently published a little book giving some very valuable information about Cedar Poles. It contains Specifications, Inspection Comments, Shipping Data, Etc. "Yours for the asking."

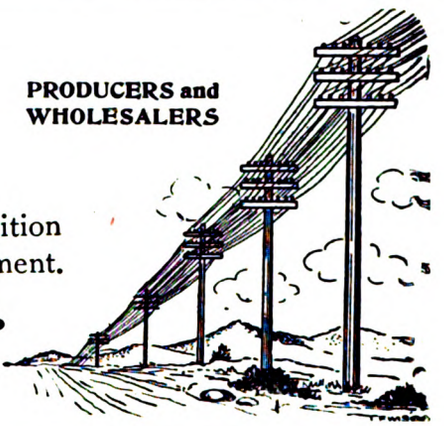
KELLOGG SWITCHBOARD & SUPPLY COMPANY - - - CHICAGO, ILL.

PITTSBURG & LAKE SUPERIOR IRON CO.,
ESCANABA, MICHIGAN.

PRODUCERS and WHOLESALERS

WE always carry a large stock of all sizes of White Cedar Poles, and having yards on all principal railroads in Northern Michigan and Minnesota, are in position to make immediate shipment.

"From the Stump to the Line."



CEDAR POLES

Upon a foundation of SQUARE DEALING we have built a pole business excelled by none. Our reputation is of more importance than your order, therefore if you buy from us, you will be assured of getting what you want.

We solicit your orders and can please you in quality and prompt shipments.

BRYSON CITY, N. C.—The Bryson City Telephone Company has been incorporated with a capital stock of $5,000. Incorporators: R. L. Sandridge and others.

HAMPLE, N. D.—The Hample-Crete Telephone Company, Hample, has been incorporated with a capital stock of $50,000. Incorporators: C. E. Knox, B. W. Slocum and H. P. Boardman.

PERSONAL.

FRANK H. BETHEL, who has been associated with the Chesapeake and Potomac Telephone Company as its general manager since May 1, 1904, has been appointed vice-president of that company as well as vice-president of the Bell Telephone Company of Philadelphia and the Delaware and Atlantic Telephone Company.

ASHLEY E. BRADFORD has been promoted to the position of district chief by the Wisconsin Telephone Company, and will superintend the construction work in several counties, with headquarters at Eau Claire.

A. T. CLARK, of Wayne, has been appointed assistant to the special agent of the Nebraska Telephone Company, with headquarters in Omaha.

D. I. DIXON has been appointed manager at Menominee by the Wisconsin Telephone Company.

VANCE LANE, formerly general manager, has been elected vice-president of the Nebraska Telephone Company.

A. C. SCHROEDER, who for the past three years has been in charge of District No. 3 of the Chicago Telephone Company, with headquarters in Barrington, has been promoted to the Chicago department.

E. H. SIDWELL has been appointed manager of the Johnson County Telephone Company at Iowa City, Ia.

MISCELLANEOUS.

IOWA CITY, IA.—A. T. Averil and G. M. Averil, of Cedar Rapids, have purchased $23,000 of the $46,000 of stock of the Johnson County Telephone Company.

MAYSVILLE, KY.—After an unsuccessful attempt to involve the Maysville Telephone Company in a sub-license contract the Bell company endeavored to obtain a franchise. Admittance to the town was denied by a vote of 10 to 1.

TOLEDO, O.—The Toledo Home Telephone Company installed 370 new telephones during the month of February. The company is very busily engaged installing new private branch exchanges. Eight contracts for installations in prominent establishments have recently been closed.

New Construction in the Field

TUCSON, ARIZONA.—The Consolidated Telephone Company is soon to build a line to San Diego, Cal.

COALINGA, CAL.—The Coalinga Telephone Company, of Coalinga, is to build a line to Fresno Hot Springs.

CORONA, CAL.—The Corona Home Telephone and Telegraph Company is to install a new system.

HEMET, CAL.—The Southwestern Home Telephone Company, of Redlands, is to establish an exchange at Hemet.

OWINGSVILLE, KY.—The Bath Home Telephone Company is building a line from Owingsville to Flat Creek.

REDDICK, ILL.—The Reddick Mutual Telephone Company is putting in a trunk line to Gardner via Wilson. They will also build a line to Cabery and Buckingham.

SPRING GROVE, ILL.—The Spring Grove Telephone Company has planned many extensions to its system. This company was recently incorporated with a capital stock of $10,000.

BEDFORD, IA.—The Bedford Telephone Company is to make many improvements in its system.

SALINA, KAN.—The Salina Telephone Company is to build a line from Sylvan Grove to Salina.

BLANCHARD, MICH.—A telephone exchange is to be installed in Blanchard in the near future. It will be connected with the Citizens' Telephone Company and the Blanchard Telephone Company's rural telephone line.

GRAYLING, MICH.—John Love is promoting the project of building a telephone line from Roscommon to Grayling.

KALKASKA, MICH.—The Kalkaska Telephone Company is building a line from Lodi to Kalkaska.

FULTON, MO.—The Buffum Telephone Company is to spend $15,000 in improving its service in Fulton. It will put in a new switchboard and new cables all over the city.

GENEVA, NEB.—The Fillmore County Telephone Company contemplates many improvements to its system.

STANTON, NEB.—The Stanton Telephone Company is extending its lines south of the town of Stanton.

ELMDALE, N. Y.—The Farmers Telephone Company, with an exchange at Gouverneur, is building lines to Elmdale. It will also build lines to Pierce's Corners.

PULASKI, N. Y.—The Black River Telephone Company is to build a number of farmers' lines this spring.

WADESBORO, N. C.—The Wadesboro Telephone Company, in addition to installing new central office equipment, will make many other improvements in its system.

NEWARK, O.—The Newark Telephone Company is to build a number of country lines.

NEWTON FALLS, O.—The Newton Falls Telephone Company contemplates further extensions to its system.

PORTLAND, ORE.—The North Western Long Distance Telephone and Telegraph Company will soon commence work on its toll lines.

PROVO, UTAH.—The Utah Independent Telephone Company is building a line between Provo and Springville.

TACOMA, WASH.—Work has been started on the plant of the Home Telephone Company, under the direction of Mr. Zahm. Mr. Zahm has charge also of the construction work at Bellingham.

GREEN BAY, WIS.—The Fox River Valley Telephone Company is to build seventy-five miles of additional toll line in the vicinity of Green Bay, to enable it to better compete with the Bell service. Frank Carswell is now general manager of the Valley system.

FORT WILLIAM, ONT., CAN.—The rate payers have passed a by-law to provide $12,000 for improvements to the municipal telephone system. Address Mayor Whalen.

Paint vs. Protection.
The life of the average pole is not over ten years. Painting does not increase this limit very much and quite frequently gives a false appearance of stability. If painted after it is set up the most needed point for pole protection is missed, the ground line. Here two distinct forces work for its destruction—the earth and the atmosphere. Poles creosoted by our process are protected not only here but throughout. Let us give you some figures which will show you how to save money.

QUALITY IS OUR POLICY — MAKERS of TELEPHONES — EVERYTHING ELECTRICAL

You do not have to pay a fancy profit to anyone when you buy

WESCO Telephones

We consider our telephones more in the nature of an advertisement for our supply business (the largest of its kind in the U. S.) than as a means of direct profit, and can therefore afford to put more real value into them and sell them at a smaller margin of profit than the exclusive telephone manufacturer can possibly afford to do.

Send for booklet and be convinced. Send for samples and you will be sure of it.

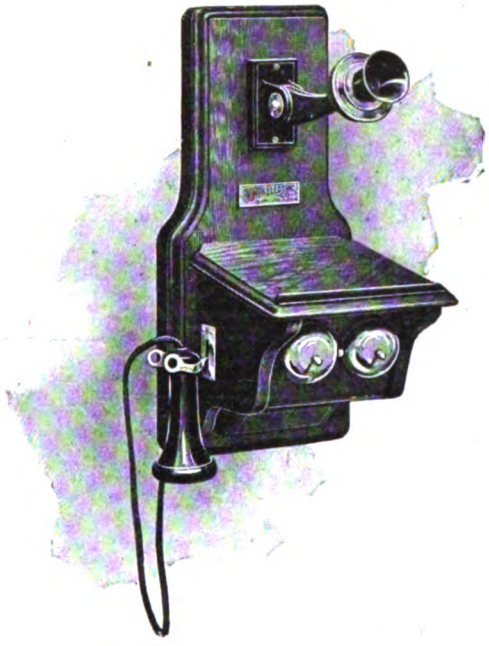
NORTH COMMON BATTERY TELEPHONES



The hinged front of "NORTH'S" common battery wall type telephone renders the condenser and instrument wiring accessible without removing from the wall.

The cabinets are not veneered, but every stick of lumber is from a veneered mill; for they handle nothing but the most beautifully figured woods. The stock is 18 months old, kiln dried 30 days and given a hand-rubbed finish involving 7 processes.

They are equipped with the following standard parts, and will operate on any standard common battery system.

"NORTH'S" Solid Back Transmitter that combines ample volume, perfect articulation, deep penetration and natural pitch.

"NORTH'S" Permanently Adjusted Receiver. The diaphragm does not rest on the outside shell, but on a bell-shaped metal seat—it isn't thrown out of adjustment by unequal expansion of hard rubber and magnet metal.

"NORTH'S" New Ringer, provided with a knife-edge, weighing-scale bearing armature—it can't tighten or drop out of place.

"NORTH'S" Horizontal Lever Adjustable Tension Switch-hook with long flexible contact springs—they can't break or become misplaced, and always resume their normal positions.

The parts are individually tested—the transmitter by an engineer. There are two inspections during assembling, a final test on completion and again a test before shipping—just to make sure.

THE NORTH ELECTRIC CO.

CHICAGO CLEVELAND DALLAS

OF INTEREST TO YOU

"STANDARD" TYPE XX

If you are in any way connected with, or interested in, the purchasing end of a telephone system, this will be of interest to you.

We manufacture and sell direct, the most practical and improved telephone condensers on the market—

Andrae Condensers

They come in three distinct styles—two illustrated herewith—and each style is fully guaranteed.

To convince you of the reliability and worth of these instruments and to show the utter confidence we place in their ability to "make good," we will equip an entire line on trial and pay return charges if not found satisfactory.

Could we offer you a more liberal proposition?

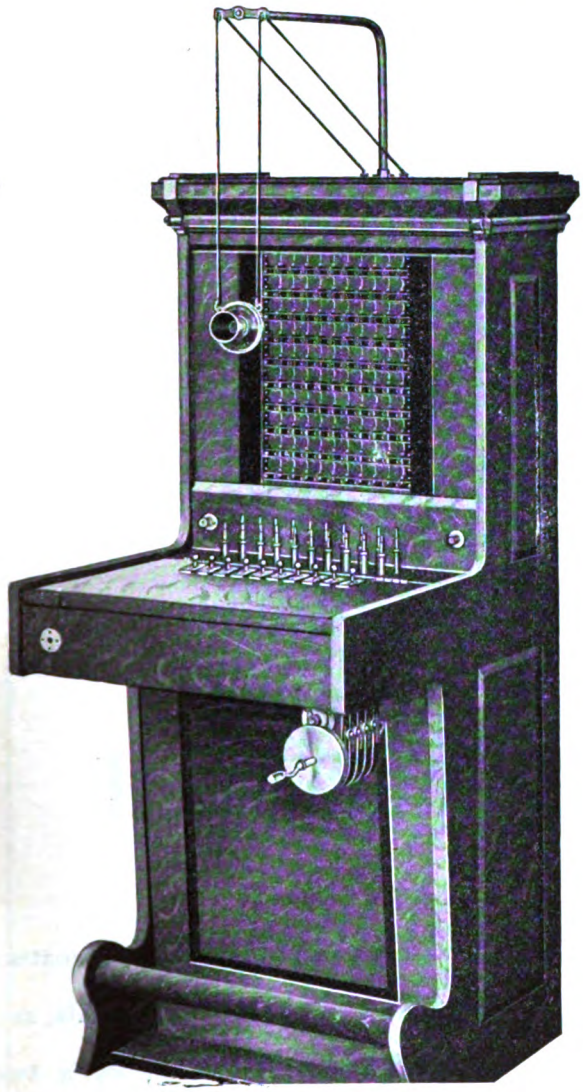
CENTURY

100 % GOOD



PERFECT MAGNETO SWITCHBOARDS

If you are in the market for a new magneto switchboard and wish to give your subscribers the very best service, at the same time reducing your maintenance expenses, it will be to your interest to use a CENTURY switchboard.

Every detail in our switchboards is carefully designed and constructed so as to eliminate all possible chances for trouble.

All parts are so made that they can be readily removed and replaced.

We would like to send you sample drops, jacks and other parts for your inspection, which we will do, charges prepaid. We hope that when you are in the market you will allow us to submit prices to you.

We have a four party selective system that is applicable to any size of magneto exchange.

This system is entirely different from any other in the market.

It has been thoroughly tested and found to be the most practical and economical of any in the market at the present time.

Write for particulars.

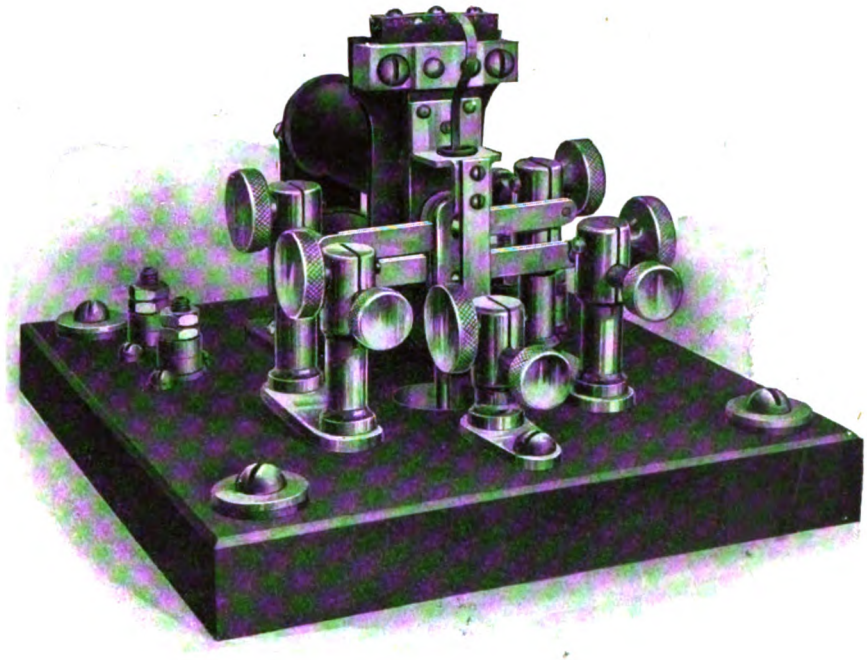
DEAN TELEPHONE APPARATUS



The accompanying illustration shows one of our

Harmonic Converter Vibrators

removed from the cabinet. It is constructed from the best material obtainable, with all parts durable, very secure and interchangeable. The vibrators are made on individual high grade slate bases, and so mounted in the cabinet as to be practically noiseless in operation and always remaining in perfect tune. The insulation of all the current carrying parts is made extremely high, and all the spring contacts are of very heavy platinum.

The Harmonic Converter operates from any direct current source and is made for **any size exchange, Local** or **Common Battery,** besides requiring only 1-50 of the current consumed to operate a motor generator set of equal capacity.

The remarkable possibilities in economically supplying alternating ringing currents for selective party line ringing and high efficiency by these Harmonic Converters is approached by no other ringing device.

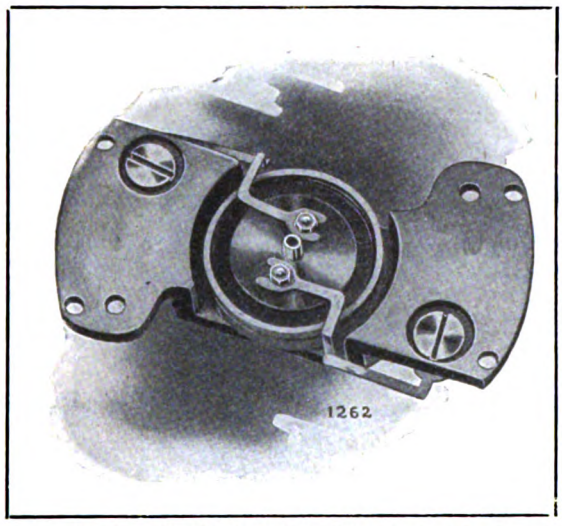
The Stromberg-Carlson Transmitter



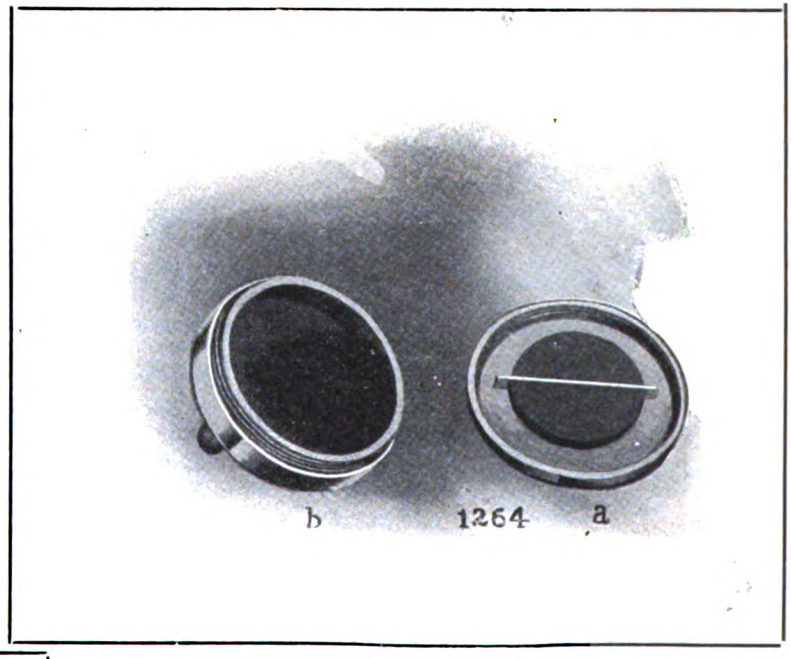
DIAPHRAGM WITH CONNECTORS AND CARBON CUP ATTACHED

Is decidedly different from any other you have ever seen. Different in ways that count for better transmission. This is quite noticeable when the transmitter is used on long distance lines. At a very slight cost you can prove this to your entire satisfaction.

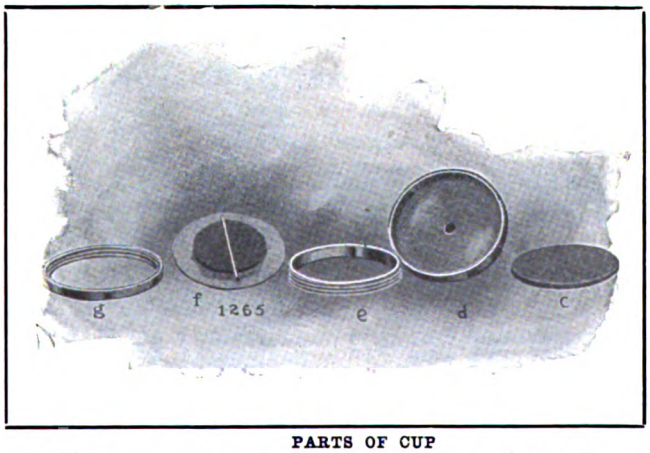
Why not do it?

THE ELECTRODES

Are made of carbon, and both are attached to the central point of the main diaphragm. There is thus produced a variation in the distance between the electrodes of twice the amplitude of variation of the central point of the main diaphragm. It is unnecessary to claim greater volume of transmission than if only one electrode moved.



CARBON CUP WITH CARBON REMOVED



PARTS OF CUP

We give the transmitter such an adjustment that under ordinary tones of voice the volume is not as loud as some of the forms of sensitive transmitters now on the market. As the voice is raised, however, the volume of transmission from the instrument is multiplied two-fold so that the transmission, when talking in a loud tone of voice, has much more volume than that of any other type. The advantage of this is readily seen.

Let us send you our new booklet describing and illustrating this transmitter. It tells the whole story; we mail it free. Just ask for Booklet No. 91-B.

WE MAKE CABLE

A common type of open wire construction which is costly to construct and maintain. Note the advantages possessed by cable distribution under conditions such as this.

Reason vs. Conservatism
Cable vs. Open Lines

IF you erect open wire leads, except of the lightest possible character, you are erecting trouble of a most costly nature.

Open wire leads are expensive to operate, they require constant supervision to maintain them at the heighest point of efficiency, and they are unsightly. If too heavy, they are a menace to life and property, and they are much affected by wind, rain and snow storms. In fact, open wires possess no advantages, except a possible slight reduction in first cost, and this is negligible, if they are standard construction.

Cable, on the other hand, has no disadvantages. Its maintenance is low, it requires but little supervision, it is rarely affected by storms of any description, it is sightly, it is compact, and it is flexible. It costs but little more to put up a fifty pair cable than ten pair, and is, weight for weight, much lighter than open wires.

Stromberg-Carlson Cable is made from the best materials by experts. It represents the acme of perfection and is the cheapest and most efficient medium for telephone transmission ever devised.

Write for our Cable Book No. 79-B. It will tell you things worth knowing.

Some Telephone High-Tension Crossings

By John Putnam.

Illustrations from Original Sketches by B. S. Stevens and Photographs by the Author.

IN the preceding number of this article we endeavored to show the dangers to which are exposed telephone lines located in too close proximity to high tension circuits, especially those carrying current at a voltage of 6,600 or more. The desirability of protection was brought out, both from a monetary and service standpoint, and attention was called to some methods of protection when high tension and telephone circuits cross each other. The reader was shown the short span crossing, which looks good and seems desirable from every point of view, and also the style of crossing in which one line is protected from the other by a screen to prevent contact between the two classes of circuits.

In Fig. 4 we have a view of a double, three phase high-tension line, crossing forty telephone wires. It is easily seen that at this point the short span crossing is not feasible. The railroad track is in the way of setting poles for such a crossing, and the high tension line meets the telephone line on a sharp uphill turn. Although the diagonal approach of the three phase line is a bad feature, no difficulty has as yet been experienced from its proximity. These telephone lines are so important that any difficulty would cause a serious damage to the service as the wires on the top arm are the New York-North Adams, Mass., long distance lines, which are heavily loaded during a great part of the time. This crossing embodies all the various ideas shown in Fig. 3. If the reader will look closely at Fig. 4 he will notice the guard wire of heavy wire rope strung from the top of one telephone pole to the other. This guard rope is carefully grounded at the foot of each pole, preferably by being buried in a deep hole, which is partly filled with coke or charcoal. Beneath the guard wire is the insulated screen, using a twelve pin arm on each pole with twelve No. 6 iron wires strung between them. This arm is noticeable in the illustration, as it projects beyond the ten pin arms which carry the working wires.

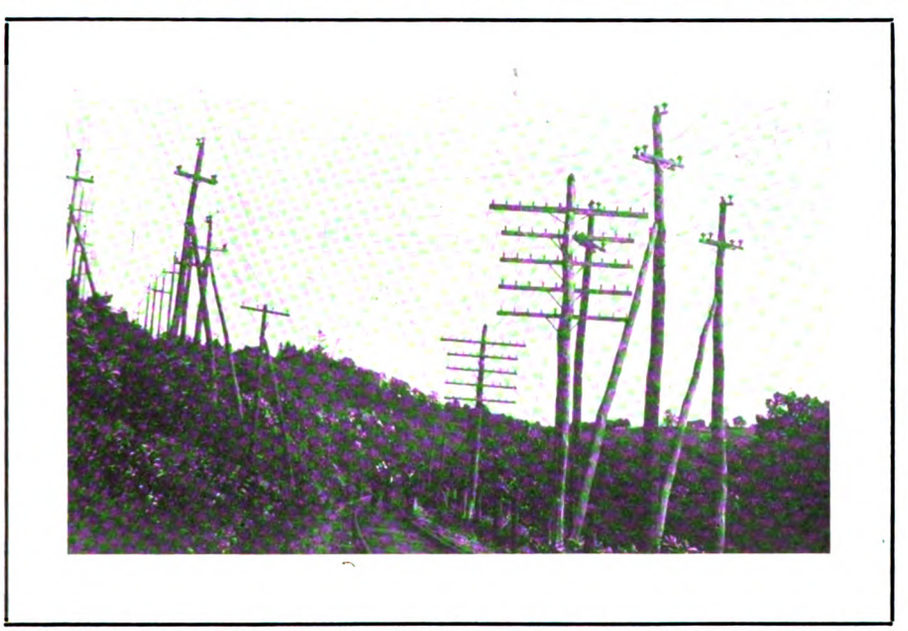

Fig. 4. The 33,000-volt high tension line approaches a 40-wire telephone line on a sharp grade, and crosses diagonally, above the telephone wires.

A more recent design for such a screen proposes making it of seven strand messenger wire and grounding the whole screen. This would seem to be theoretically better. Still another design proposed for cases where the telephone line crosses above the high tension conductors is to screen the latter wires above and below in order that in case of a break the telephone wire would not come against the three phase line by whipping around under it.

Imagine, now, that we climb the railroad embankment at the left in Fig. 4. After some little exertion we will be pretty nearly on a level with both lines, and upon turning about the crossing will look as it does in Fig. 5. The screen can be seen particularly well, as can the three wires of the three phase line. In the background will be noticed the highway, the Housatonic River, and the thickly wooded hills beyond it, all giving one a particularly good bit of local color. The telegraph line at the left in Fig. 4 has no protection, but perhaps the telegraph company can afford to take a chance. From its appearance it is a safe prediction that it will fall down before the three phase line does.

Lines carrying alternating currents at high voltages are subject to a peculiar trouble known to the people handling them as a line surge. Alternating currents being subject to the sine law, are commonly explained by the familiar sine curve. Draw a horizontal line with a high continuous curve half above and half below it. This represents one complete cycle of a single phase alternating current. Now, on the same line, draw a similar curve one-third behind that. You have now a pretty fair representation of a three-phase current. Fancy these curves all in a wave motion following one another rythmically and harmoniously. Now suddenly stop the advance wave and what happens? Your succeeding waves pile up on it and its height increases greatly. Some such action sometimes takes place in the high tension circuits. It may be due to a sudden decrease or increase in demand for current at the end of the circuit, or to some other cause such as throwing in or out a large amount of impedance, thereby causing a distortion of the phase. This increase in current causes the circuit breakers to operate at a time when the current flowing is at a maximum. When the circuit is thus suddenly interrupted, the current no longer follows the sine law, but drops instantly to zero. This causes the electro motive force of self induction in the circuit to suddenly rise to many thousands of volts above the active electro-motive force of the line. This high voltage tends to short circuit on itself and does it through the arresters on the high tension circuit. These arresters are simply a zig-zag arrangement of a

Digitized by Google

number of knobs of insulating material having a metallic covering, all slightly separated from one another so as to form a series of spark gaps from line to ground. Thus for an infinitesimal instant one side of the power line is effectually grounded, thereby raising the potential of the opposite side to many thousand volts above that of the earth. This causes the static field of force which, under normal conditions, is more or less closely confined to the power wires themselves, to become suddenly extended over a wide area, which tends to set up induced currents in telephone or other lines which happen to be in the immediate vicinity. When the discharge to earth from the power line takes place, it is usually oscillatory in character and induced currents of high voltage are set up in the adjacent telephone circuit. These currents are earth seeking, and can only escape by breaking down the insulation of the telephone line at some point. This they do by jumping across the arrester gaps or from cable conductor to cable conductor, thereby burning off the conductor.

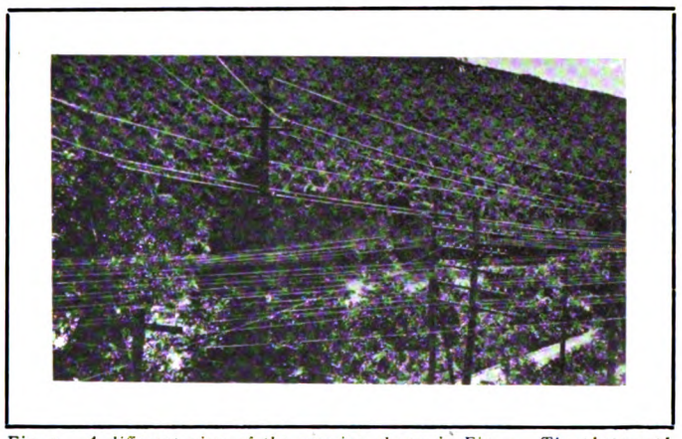

Fig. 5. A different view of the crossing shown in Fig. 4. The photograph was taken from a point on the hillside, above the wires.

Such a trouble took place very recently at the telephone exchange in New Milford. There was the familiar static discharge into one of the lines and a number of the drops on the magneto switchboard fell all at once. Upon investigation the line to the power station was found open and one other line grounded. A pair of cable conductors forming a portion of the power company's line was afterward found to be burned out. It is interesting to telephone men to know what was found on these two lines. At the subscribers' station one line was equipped with carbon cutouts only. These showed the usual signs of the passage to ground of a high voltage current. After cleaning them the line was found to be clear. The other line was equipped with protectors consisting of a carbon cutout, a seven ampere fuse, and a sneak current device in juxtaposition with the fuse. These showed the same conditions as the protection on the first mentioned line. In no case had the fuses or sneak current device operated. Nor was the metallic globule in the carbons melted. In fact, both lines showed the same effects as though a lightning discharge had taken place.

It is evident from these results that while the voltage of the induced current in the telephone line was very high, the amount of current was exceedingly small. The damage to the cable conductors was not due to a heavy influx of current, but to the heat occasioned by the arc when the current jumped from one cable conductor to another. It has now been recommended that the telephone line be moved at those points where it is so close to the power line. The question immediately arises as to what distance this separation ought to be. The common sense answer is that it should be more than the sum of the heights of both lines. That is, if both lines were thirty feet high, they should be over sixty feet apart.

The sketch Fig. 6 shows an underground crossing. This is rather an expensive type, but ought, if properly built, to give good protection. Our first thought regarding this crossing would probably be that here we have a well nigh perfect screen, consisting of the earth itself, but experience has shown that with a high tension current flowing into the earth certain methods of construction are not of the best.

As originally built this crossing was made with an iron pipe 1½ or 3 inches in diameter, according to the wire capacity desired, laid below frost line, from pole to pole. At each pole, which is properly guyed, is the usual pipe bend, and at the end of the pipe where it runs up the pole, is a goose neck to keep out the rain. A hole drilled at the lowest point of the duct over a pocket filled with crushed stone will serve to drain the conduit of moisture due to condensation. The telephone company has used No. 14 twisted pair "distributing wire" drawn into this conduit, and has had comparatively little trouble with it. This wire is sleeved direct to the line without fuse or spark gap protection. Some of these crossings are remote from a repair man, and it is deemed more advisable to risk losing a pair of wires worth $1.47 a hundred feet than to hire a team at an expense of $2 or $3 after every lightning storm. The illustration, Fig. 7, shows one of these crossings where a six circuit telephone line crosses the high tension. The contour of the ground is such that only one telephone pole could be shown in the picture. This crossing has been in use two years, and only once has there been any trouble with it, when two pairs of wires were opened by lightning, although lightning storms are frequent in this part of the country. Even this tendency to trouble might, to an extent, be eliminated by substituting insulating fibre conduit for the iron pipe. The need of such substitution is well shown by a recent case of underground crossing trouble. In this case, the iron pipe was not buried deeply enough, being only about eighteen inches underground. The crossing is 140 feet wide of inch and a half pipe. Two circuits of No. 19 gauge single pair lead covered cable with a circular loom weaving over the lead, were drawn into

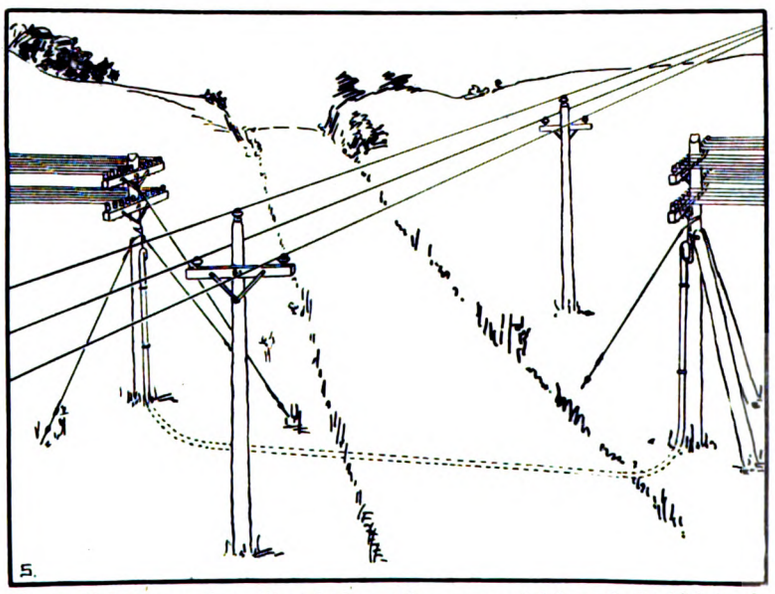

Fig. 6. Toll line crossing. The telephone wires are carried beneath the high tension wires in an underground conduit.

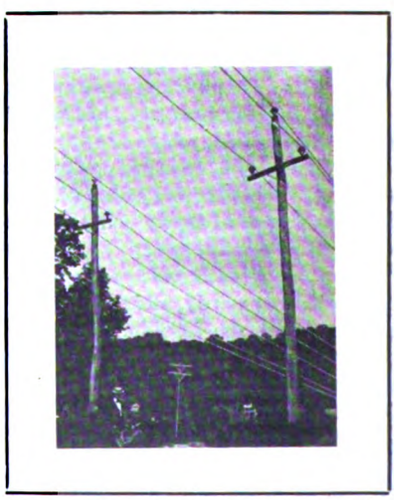

Fig. 7. The underground crossing provides for absolute separation.

Digitized by Google

it. The 33,000 volt line broke and fell on the ground about midway of the crossing. Both telephone circuits were burned off at each end of the pipe. Upon examination the earth and stones were found fused together between the pipe and the high tension line, and the pipe showed signs of having been heated to a high temperature. Evidently the current had traversed the pipe to each end and from there arced to the single pair cables and burned them off. The substations were unharmed, being protected by carbon cutouts. Here were three faults in the crossing construction; a metallic pipe, that pipe not deep enough, and the wrong kind of wire used, the latter being too small in gauge and having a metallic covering. The chance of the high tension circuit falling on the ground at the point of crossing is, of course, a very remote one, but it did actually happen, and these crossings must be planned on the supposition that such an accident is to take place, and not on the theory that if they are not right nothing will happen anyhow. The proper form for an underground crossing is rather problematical, but reasoning from theory and what experience has shown, it is evident that the conduit should be insulating, that it should be buried at least three feet, and the wires should be twisted pair, insulated, but not having a metallic cover and not smaller than No. 14 gauge. The depth for the conduit given above is based upon no especial theory except that in many places it would be below frost line, and that such a depth for excavation could be used without unusual expense.

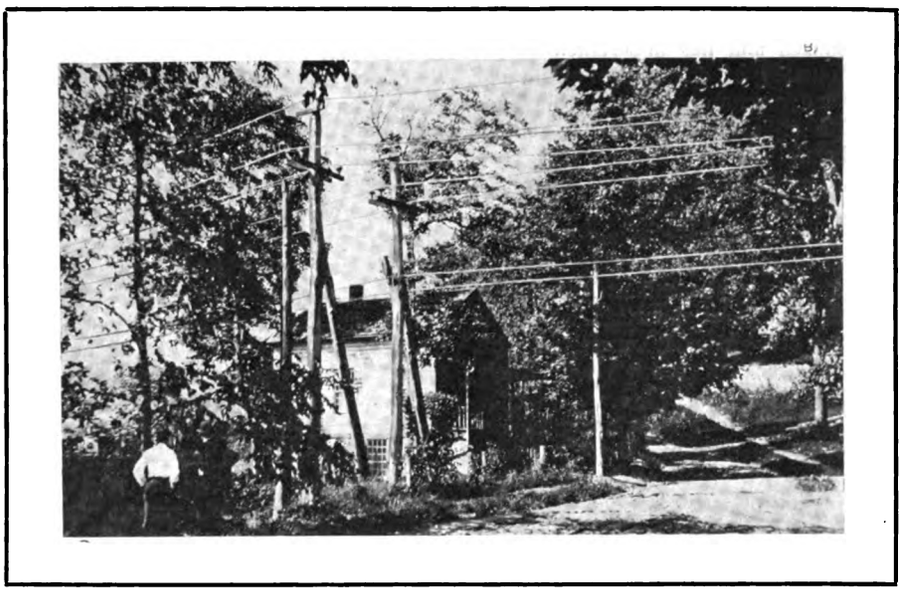

Fig. 8. The subscribers' service wires, supported on brackets on the shorter poles, pass the high tension wires underground.

Fig. 8 shows a single metallic circuit subscriber's service wire crossing the high tension line underground. The telephone poles are twenty feet high with two iron wires on a pair of brackets. The conduit is inch and a half pipe and through it is drawn a twisted pair of No. 14 distributing wire. There are a number of such small crossings in Connecticut, and they have given little if any trouble. This may be because the high tension line has not fallen on the ground over them except in one instance, as described in the preceding article. Although such a crossing for a single pair of wires might be considered expensive its use is justified not only by the protection afforded the subscriber, but by that given other circuits in the cable from which these wires are taken.

(To be continued.)

Telephone Engineering*

By J. J. Carty.

UNLESS there is made a fairly correct forecast of the probable growth of subscribers' lines for a period of 15 or 20 years, it is clear that substantial errors will be made; but more than this, it is necessary not only to forecast the total number of lines expected, but their location must be determined within close limits. Not only must the location of the lines be decided upon, but the number of calls per day which may be expected over each line must be estimated; not only must the number of calls which are expected be correctly determined, but the time of the day during which these calls may be expected must be arrived at in some manner. Even more than this must be done, because it is necessary not only to know all of these facts, but also it must be known where the calls are to go. We must also know what proportion of these are likely to be toll calls, what proportion long-distance calls, and various other factors of like nature must be determined.

But conceding all this, what is the alternative method which we can follow? If we are to abandon the method of study herein described, what shall be substituted for it? By what plan shall we proceed which will enable us to arrive at a more economically constructed system? What method shall we adopt which will enable us to proceed without answering such questions as those which the present method of study undertakes to answer? It is obvious that what are erroneously called "common-sense" methods might be employed. Buildings might be erected in various locations in a city, chosen after an inspection of the region; they might be substantially constructed and provided with switchboards. These buildings might be joined together by subways, and in the subways cables could be located. Suburban and long-distance trunk-line subways might also be constructed, and there is no doubt that according to such a plan telephone business could be carried on. But have we, after all, in following this method avoided answering any or all of the questions with with which the study undertakes to deal? Most certainly we have not, and while it might not be appreciated, every step taken in this so-called common-sense method really makes a direct, though unconscious and unintelligent, answer to all of the questions propounded and dealt with in the formal study. If, following this common-sense method, it is decided to erect at a given location a central-office building with a switchboard of a given size, this office must be intended to serve a district of some definite form. If, as would of course be the case, other central-office buildings are erected at other locations, they too must be constructed with reference to fixed districts and their number must be determined with reference to the expected growth in subscribers; so that after all the magnitude of the expected growth is a factor which is unconsciously dealt with. But in determining upon the size of the switchboard and its construction, whether we realize it or not, a definite, though unwitting, answer is made to the questions of what shall be the rate of calling, what shall be the destination of the calls, what shall be their character, and at what time they shall occur. The switchboard and building must be planned for some set of conditions which can be established only by data of this character. Merely ignoring these questions and erecting the switchboard and arranging central offices without making a study does not avoid answering the questions, for by the construction carried out a direct and unequivocal answer to all of these questions is made, yet without giving consideration to any of them or even recognizing their existence.

*Continued abstract from paper read before the American Institute of Electrical Engineers, Feb. 23, 1906.

Digitized by Google

It is easy enough, after central offices have been located, to plan for a subway joining those offices, but somebody must answer the question of how many ducts shall be provided in this subway. It may be done, on the one hand, by engineers after careful study with all of the facts before them, and after having analyzed the statistics of the past and having exhausted all possible methods of throwing light upon the subject; or it may be done by a man in the street with a pickaxe. Those who would follow the pickaxe method would not avoid questions which the engineer has recognized and has undertaken to answer. They would, by the number of ducts they would put down and by the character and magnitude of the other construction, give their answer to all of these questions without having considered any of them. As to which of these two methods should be followed, the telephone company must decide.

Ordinarily, engineering has to do principally, if not exclusively, with physical factors, but telephone engineering has not only to deal with physical factors of the utmost complexity, but it has also to deal with commercial questions which, of themselves, would seem to be only remotely connected with the work of the telephone engineer, but which really vitally affect it.

A telephone toll line and switchboard system might be designed in accordance with the highest state of the art and constructed so as to give the best efficiency and yet by the action of the business management, causing the adoption of what might seem to be a reasonable commercial practice, the operativeness of the switchboard system might be totally destroyed. This idea will be readily comprehended when we consider what would happen to the present toll board at Cortlandt street, operating on the recording basis, using the two-number method of calling, if, by some change in business plans, the particular-party method in use extensively in many other localities were adopted. Only a brief consideration of this case is required to show that, in addition to the present recording operator, a second set of operators would have to be employed, who would be required to call up the subscriber desiring the toll connection and obtain from him the details of his call. The adoption of such a method, while in itself a wasteful and inefficient one, would in the case I have chosen require the radical reconstruction of our entire toll-board plant. More than this, the adoption of such a method would render it impracticable to follow the direct-line trunking method which is now possible by the use of the two-number plan of calling. The abandonment of this method would require that such toll lines be handled from toll boards. The magnitude of the revolution which this would make in the engineer's plans will be seen when I say that whereas, by the two-number method, one toll board occupying one floor of the Cortlandt street exchange is sufficient, there would be required, if the particular-party method were employed exclusively, as many as five or six toll boards occupying five or six floors in the Cortlandt street building, and requiring five or six times as many operators for their working.

Another example, perhaps even more far-reaching in its effect upon the work of the engineer, is the question of whether the telephone company shall charge for its service on the flat-rate plan, or by messages as is now generally the case in this neighborhood.

Under the flat-rate method of charging, in large cities, the more times the customer uses his telephone during the day the greater is the expense to the telephone company. This is due not only to the increased number of operators required, but also to the increased switchboard sections needed for them and to the increased trunk-line plant. By the method of flat-rate charging there is no motive for the telephone company to encourage an increase in the number of calls. For this reason a flat-rate plan would have to be so engineered and the rates would have to be so established that extension stations, desk stands, and other auxiliaries tending to make the use of the telephone easy and therefore more frequent, must be discouraged.

The existence of the flat-rate in such cases would not only be attended by all of these consequences, but many others, one of which is of great importance. I refer to the excessive use of the subscribers' line which such a rate engenders. The consequence of this excessive use is that the busy calls attain such serious proportions that it is difficult, if not absolutely impossible, to give satisfactory service. This trouble from busy calls has at times attained such serious proportions that engineers in various places have exerted extraordinary efforts to mitigate the evil, but without success. This difficulty having been caused by commercial methods could not be overcome by the engineer employing physical methods. The solution of this difficulty lay with the business management and consisted in the adoption of a proper system of message rates.

As soon as the message-rate system was adopted all of these difficulties disappeared, and many positive advantages not even suspected as residing in the message-rate plan developed. Under the flat-rate system there was every temptation for the subscriber to send as many calls as possible over one line. Those having but small use for a telephone could not afford to pay the high flat-rate which that method of working made it necessary for the telephone company to charge. The consequence of this was that only those having a large number of calls installed a telephone, and those having small use of the telephone made it a practice to use the telephones of their neighbors or did not employ the telephone at all. This practice on the part of the small user was a natural one in view of the fact that under the flat-rate the telephone subscriber considered that it cost him nothing to allow his neighbor to use his telephone. All of this resulted in a system largely composed of overloaded lines. Under the conditions obtaining in our large cities, the relief of an overloaded line can be obtained only at the expense of a second line, which in most cases meant doubling the cost of the telephone service.

By introducing into the large cities the message-rate system, and by placing proper limits on the load with should be carried upon one line, and by providing a graduated system whereby additional lines could be obtained on a basis proportionate to the amount of their use, relief from this overloading was afforded. More than this, under the message-rate system it is obviously for the interest of the telephone company to encourage the use of the telephone in every manner. For this reason it became feasible and desirable to install as many auxiliary instruments as possible. This was accomplished by providing for those who required two or more lines a switchboard located at the subscribers' premises, this switchboard being so constructed that as many local stations as might be required could be installed at a moderate equipment charge. Each one of these stations is so equipped that it may be connected with a trunk line to the central office or it may be connected to any of the other local stations without communicating with the central office. In this way not only was the central office substantially changed, but a very important advantage was obtained. Talking between local stations at a local or private branch exchange switchboard could be accomplished without any message charge. This development not only reacted upon the central office engineering and the general engineering of the plant, but also completely changed the state of affairs with reference to speaking-tube telephones, practically limiting the former speaking-tube system to special and peculiar conditions.

Considering these two examples of the method of charging which shall be followed upon toll lines and the method of charging which shall be adopted upon subscribers' lines, it will be seen that they in a most extraordinary manner affect the work of the telephone engineer. So profoundly do such considerations affect the proper engineering of the telephone plant that it must be said that good telephone engineering cannot exist side by side with a bad system of rates or with improper business methods and organizations. Nothing more forcible than these examples needs to be mentioned in order to show the intimate relation between telephone engineering and business management.

(To be continued.)

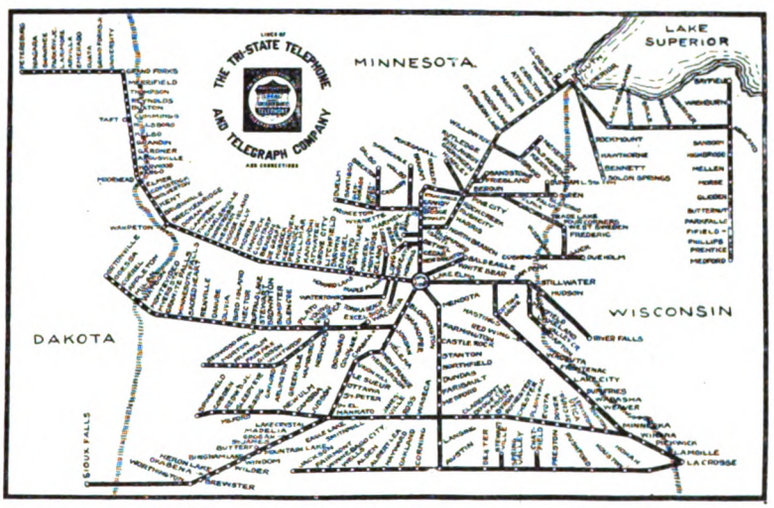
Cost of Conduit Construction

AT the recent meeting of the Northwestern Electrical Association, at Chicago, Mr. W. D. Burford presented a paper on underground construction as used by a new electric lighting and power plant, at La Crosse, Wis. This paper, although treating especially of conduit construction for the use of electric transmission, is valuable to telephone engineers because it gives the cost of such construction as actually carried on in a small city.

In the following table the prices are based on 2x12.-in. hemlock planks for foundation for the conduit, with a similar plank covering the work—hemlock at $20 per thousand; Portland cement at $1.60 per barrel; conduit layers at 30 cents per hour; trenchers and common laborers at 17½ cents per hour; conduit at 5 cents per duct foot. The following table shows the cost of laying multiple duct conduit per lineal foot:

No. of ducts.	Labor.	Mat'l.	Repaving— Brick.	Repaving— Macadam.	Sand.	Total.
4	$.25	$.39	$.39	$.20	..	$1.23
6	.28	.57	.39	.20	..	1.44
8	.45	.65	.39	.20	..	1.69

Mr. G. B. Springer, civil engineer of the Chicago Edison Company, in discussing the paper, gave the following data on conduit construction in Chicago: The principal qualifications of a good conduit are practical indestructibility and freedom from disintegration by fire, water, acids, alkalies or electrolysis. A smooth inside surface is desirable to permit of easy drawing in of cable; also a style of conduit permitting of economical installation in crowded streets. The vitrified clay conduit has so far been found to be the kind most nearly attaining these requirements. These conduits are made in both single and multiple duct, the single being about 3.5 in. in diameter, or 3.5 in. square, and 18 in. long. Multiple conduit is made in two, three, four, six and nine duct sections, two to three feet long.



This map shows the extensive Independent system by means of which farmers on countless branch lines are kept in touch with the cities, and city merchants may communicate with business men in all other towns within the indicated boundaries.

The single-duct conduit is best adapted for use in streets crowded with gas, water and other pipes, as the conduits may be divided into several layers crossing over or under the many obstructions found in the streets of large cities. A conduit construction which is made up of single ducts where each horizontal and vertical joint is broken, also has the additional advantage of preventing fire from spreading from one duct to another, as might occur in multiple conduit. The multiple conduit is, however, well calculated to be used in outlying communities where there are not many obstructions, particularly in lines of from two to four ducts. This style of conduit is somewhat cheaper to lay than the single duct.

In laying the conduit a trench is dug sufficiently wide to allow three inches of concrete to be placed on each side of the ducts, and of sufficient depth to allow at least 30 in. of concrete on top of the top layer of concrete. Three inches of concrete is laid in the bottom of the trench also, thus insuring a concrete protection of three inches on all sides of the ducts. The trench is graded from some point near the middle of the block to the manhole at each intersection, or from one manhole to the other, as the case may be, at a gradient of about 2 in. or more to 100 ft. of trench.

In laying the single duct tile the ducts are placed close together, the joints and triangular spaces in the corners being plastered and filled with cement mortar, of a mixture of one part cement to one part of sand. A wooden mandrel about four or five feet long and three inches in diameter, with a rubber or leather washer from three to eight inches larger on one end is drawn through each duct as the conduit is being laid; this is to insure any foreign particles or cement which may have gotten into the joints being drawn out. It also insures a good alignment.

A bricklayer is generally used in installing the single-duct conduit, the cost being slightly more for a bricklayer and helper than for three ordinary laborers as used in placing the multiple conduit. A good man, however, will lay from 1,600 to 2,200 duct feet of single-duct conduit in an eight-hour day.

In regard to the cost of conduit construction, as Mr. Burford says, there are many varying figures given off-hand. The vast difference in local conditions makes it very difficult to give a set of figures which will hold good in many places or in fact in the same place under different circumstances. There are often obstructions causing several feet difference in depth of trench, additional material and labor required, etc., to be considered as well as variations in cost of material, labor and number of ducts installed.

The following table, however, is submitted as a guide in approximating the cost of work of this character as a result of conduit construction covering ten years in Chicago. The cost of manholes is not included in this table, but is given in the one following table for estimating cost of conduit per duct foot, in different groups, in various pavements:

Kinds of pavement.	Number of ducts. 2	4	6	9	12	16	20	25	30
No pavement	$.18	$.18	$.18	$.18	$.18	$.18	$.18	$.18	$.18
Macadam	.24	.21	.20	.20	.19	.19	.19	.19	.19
Cedar	.26	.22	.21	.20	.20	.19	.19	.19	.19
Cedar reserve and granite.....	.31	.24	.23	.21	.21	.20	.20	.20	.19
Granite reserve	.43	.31	.28	.24	.24	.23	.22	.21	.21
Asphalt and brick reserve	.68	.43	.37	.31	.29	.26	.24	.24	.23

Table showing cost of conduit per duct foot in Chicago.

The following table contains approximate figures based on conditions prevailing in Chicago, and may be used as a guide in estimating the cost of conduit construction in connection with the table preceding. These figures were compiled for use in estimating total cost of manholes in different kinds of pavements:

Kinds of pav't.	Size of manholes in feet— 3x3′	3x4′	4x4′	4x5′	5x5′	6x6′	6x7′ $142	7x7′ $160	8x8′ $189	9x9′ $222
No pavement	$41	$47	$53	$64	$109	$133	$142	$160	$189	222
Macadam	42	48	55	66	111	135	146	163	193	226
Cedar	43	49	56	67	112	136	146	164	194	227
Cedar reserve and granite ..	44	50	57	68	113	138	149	167	198	231
Granite reserve..	46	53	60	72	117	144	155	174	207	243
Asphalt and brick reserve..	50	58	67	80	126	156	168	188	224	264

Table for estimating total cost of manholes in different kinds of pavements.

The above figures are based on the same prices for repaving,

Digitized by Google

labor, bricklayers, cement and sand, as given in the table for conduit, and upon the following unit prices:

Brick work including labor and material	$12.50 per cu. yd.
Concrete tops and bottoms	$7.50 per cu. yd.
Back water gates	$6.50 each
Sewer grates	30 cents each
Sewer connections	$12.50 each
Sewer permits	$5.50 each
Manhole frames and covers	$15.00 each

PLANS FOR MERGING MISSOURI INDEPENDENT ASSOCIATIONS OUTLINED AT CONVENTION.

INDEPENDENT telephone men, representing about 100 Missouri companies at the convention held at Kansas City on February 22 and 23, have worked out a plan for the merging into two organizations of the separate concerns composing the Missouri Independent Telephone Association. Those in districts 1, 2, 3 and 4 will be merged into a northern company and districts 5, 6, 7, 8 and 9 into a southern company. The property of each exchange or company coming into the merger will be appraised and stock in the new company to the amount of the ascertained value of each plant will be issued.

The delegates from each district were called upon to express the general sentiment on the subject of the proposed merger of the telephone men whom they represented, and it was found that there was not a particle of opposition.

The details of the formation of the two companies were intrusted to a committee for the whole state composed of G. W. Schweer, Windsor; J. F. Barnett, Rutledge; Ed Hook, Appleton City; W. B. Scruggs, Harrisonville; Houck McHenry, Jefferson City.

The delegates present perfected the organization of the Independent Telephone Association of Missouri, with the election of the following officrs:

President, W. B. Scruggs, of Harrisonville; secretary and treasurer, Houck McHenry, of Jefferson City; nine vice-presidents, one from each district, as follows: First, A. T. Ralston, Maryville; second, G. A. Barnes, Hamilton; third, Houck McHenry, Jefferson City; fourth, C. O. Raines, Canton; fifth, W. Roy McCanne, St. Louis; sixth, G. W. Schweer, Windsor; seventh, J. W. Lane, Lamar; eighth, J. W. Hale, West Plains; ninth, unfilled.

The following are the names of the counties in each of the Missouri districts: District No. 1—Atchison, Nodaway, Worth, Harrison, Holt, Andrew, Gentry, DeKalb, Clinton, Buchanan, District No. 2—Mercer, Putnam, Grundy, Sullivan, Livingston, Linn, Caldwell, Ray. District No. 3—Schuyler, Adair, Macon, Randolph, Munroe, Howard, Audrain, Boone, Gallaway, Cooper, Saline, Cole, Monteau. District No. 4—Scotland, Clark, Knox, Lewis, Shelby, Marion, Ralls, Pike, Lincoln. District No. 5—Warren, St. Charles, St. Louis, Montgomery, Osage, Gasconade, Franklin, Jefferson, Maries, Phelps, Dent, Crawford, Washington, Iron, St. Francois, St. Genevieve. District No. 6—Platte, Clay, Jackson, Lafayette, Case, Johnson, Pettis, Bates, Henry, Benton, St. Clair, Hickory. District No. 7—Vernon, Cedar, Barton, Dade, Jasper, Lawrence, Newton, McDonald. District No. 8—Miller, Camden, Polk, Dallas, Laclede, Pulaski, Greene, Webster, Wright, Texas, Christian, Douglas, Stone, Taney, Ozark, Howell. District No. 9—Reynolds, Shannon, Wayne, Oregon, Carter, Ripley, Butler, Stoddard, Dunkin, New Madrid, Mississippi.

These delegates to the annual meeting of the national association, at St. Louis, next June, were appointed:

Delegates—J. F. Barnett, Rutledge; W. Roy McCanne, St. Louis; C. J. Myers, Kansas City; A. T. Ralston, Maryville; G. W. Schweer, Windsor.

Alternates—M. L. Golliday, Holden; Dr. J. J. Newell, St. Joseph; Houck McHenry, Jefferson City; Ed Foote, Pleasant Hill; T. G. Taggert, Richmond.

President W. B. Scruggs was appointed the state member of the national executive council.

The following resolution was adopted just before the meeting adjourned:

"Resolved, By the Missouri Independent Telephone Association, that we request all farmers' mutual telephone companies throughout the state to incorporate under the laws of the state and operate in harmony with and co-operate with the Independent telephone companies in their localities, and become members of this association."

Several addresses of special interest were made during the session. J. F. Barnett, traveling secretary, spoke on the subject of the organization of the state into nine districts, and later the organization of these districts into a state association.

Theodore Gary, of Macon, vice-president of the National-Interstate Telephone Association, delivered an extremely interesting address on his experiences in financing small telephone companies.

H. C. Dougherty, of Concordia, addressed the convention along somewhat similar lines, giving instances where companies in other lines of business had followed the plan adopted by Mr. Gary and the telephone men of Missouri.

The convention adjourned sine die. The committee having the merger proposition in hand will report to the executive committee of the association, and is expected to be able to announce substantial progress within the next two months.

AUTOMOBILE EXHIBITORS EMBARRASSED BY LACK OF TELEPHONE FACILITIES IN PHILADELPHIA.

BELL methods for securing exclusive contracts are too well known to cause more than ordinary comment. An interesting example of the petty tactics employed to choke off an opportunity for competition which would cause it to make a poor showing before the public recently occurred in Philadelphia.

The Automobile Trades Association, which has been conducting expositions in the more important cities throughout the country has for its manager one Chester I. Campbell, who acts as dictator in the affairs of the company. Recently he had charge of an automobile show in the Pennsylvania city. Among the exhibitors were several firms who desired Keystone telephone service at their booths.

When the company started in to install the equipment this overlord of the Automobile Trades Association opposed the Keystone Company, having previously made arrangements with the Bell Company for exclusive service. Notwithstanding his opposition the Independent telephones were installed and continued in operation for about two days, when the wires were maliciously cut.

A temporary injunction was asked for, but as the show would have been over before a hearing could have been brought about, the matter was allowed to drop.

A good deal of feeling among the exhibitors was manifested against Campbell, and rightly so, because their business was materially affected. It is doubtful whether the Automobile Trades Association had anything to do with the matter, but if it did, it would be well for it to consider the business interests of the exhibitors who contribute to its support.

MERCHANTS AT JOHNSTOWN, PA., DECLARE IN FAVOR OF INDEPENDENT TELEPHONE SYSTEM.

THE Merchants' Association of Johnstown adopted at its last meeting the following resolution:

"Inasmuch as the Johnstown Telephone Company's rates are about one-half former Bell rates and it is giving a satisfactory service to over 3,500 connections with the Johnstown exchange district, and long distance service to all points desired by members of our association; be it

"Resolved, That in order to reduce the expense and annoyance incident to maintaining two telephones, we hereby declare ourselves as being favorable to supporting our home company, the Johnstown Telephone Company, exclusively, so long as it operates under the present policy, and maintains the present schedule of rates."

It seems to be the prevailing opinion nowadays in many parts of the country that one telephone is better than two, as the Bell companies have so long insisted, provided that the one connects with an Independent exchange.

QUERIES

VOLTAGE OF A BUSY TEST.—(672.)

Will you kindly explain what is meant by a five-volt busy test? J. Q.

The voltage of a busy test is a term used to designate the difference in potential which exists between the sleeve of a multiple jack which is tested by the operator and the tip of her plug at the time when the test is made. To take a well known circuit as an example: In Fig. 672 we have shown the conditions which exist in the sleeve circuit at different times. For simplicity all except the most essential parts of the circuit have been omitted. There is shown the sleeve connection for multiple jacks J^1, J^2, J^3, going to ground through the 30 ohm resistance which is contained in the winding of the cut-off relay, not shown in the drawing. S^1 is the sleeve of a subscribers' operator's cord circuit, in the condition which occurs when the plug is connected to a line having the receiver off the hook, which causes the supervisory relay to be drawn up, shunting the supervisory lamp, which has a resistance of 120 ohms, by the resistance R^2, 40 ohms. The resistance R^1 83 ohms is inserted in the sleeve circuit between the lamp and the plug.

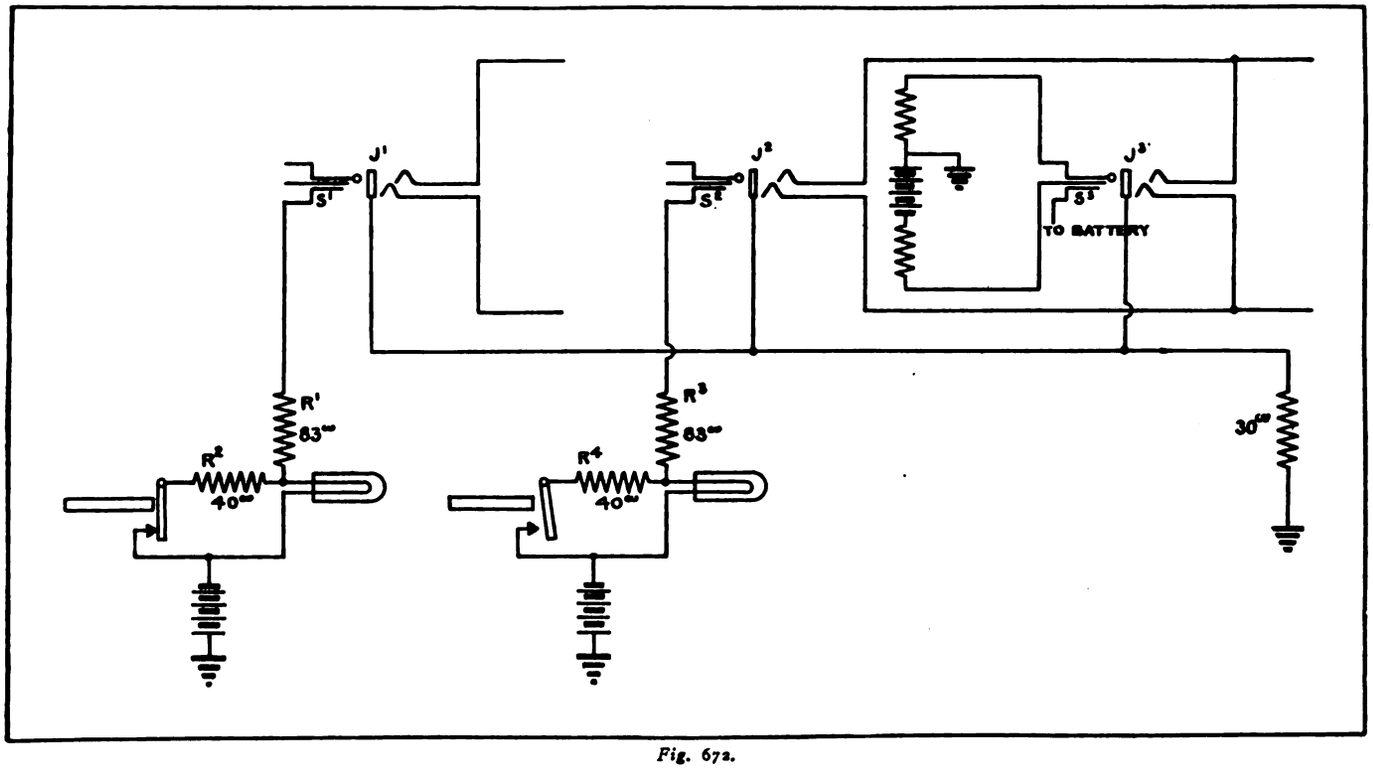

Fig. 672.

S^2 represents a similar cord circuit, with the exception that a condition is assumed where the subscriber has not answered and the telephone is not off the hook, leaving the lamp burning, as it is not shunted by the resistance R^4. Adjacent to the jack J^2 is a sketch outline of the cord circuit, which shows the tip of the plug connected through the winding of repeating coil to the grounded side of the central office battery. When no current is flowing through it, therefore, this plug tip is at ground potential.

Assume now that the sleeve S^2 is connected to jack J^2 by the insertion of the plug, and that operator tests jack J^2 to see if the line is busy. We find that the jack J^2, which, of course, will be at the same potential as J^2 and other sleeves in multiple with it, has been raised to a certain potential above the ground, due to the passage of current from the negative side of battery through the sleeve circuit connected to resistances, sleeves of plug and jack S^2 and J^2 respectively, 30 ohm resistance, etc., to ground.

The amount of this difference of potential may be readily obtained by considering the amount of drop in various parts of the circuit. For the sake of convenience, we will neglect the resistance of the wires in the switchboard cables, as it will be a very exceptional case where this resistance would exceed 1 to 1½ ohms. The potential is figured as follows: The resistance from negative side of battery through the lamp resistance R^3 is 203 ohms; the resistance of the entire circuit is 203 + 30 ohms, or 233 ohms. As the fall in potential throughout the circuit is proportional to the resistance of each part from the entire potential difference points J^2 or J^3 to ground will be $\frac{30}{233} \times 24$, which = 3.09 volts, provided that battery is charged to 24 volts pressure.

In the other case, which is the more usual one, where the supervisory lamp is shunted by the 40 ohm resistance, a different result is secured. Here, figuring the resistance of the circuit, we find the lamp and resistance coil give a combined value of

$$\frac{120 \times 40}{120 + 40} = \frac{4800}{160} \text{ ohms} = 30 \text{ ohms.}$$

The total resistance of this complete circuit is therefore 30 + 83 + 30 ohms = 143 ohms. The sleeve of jack J^2 will therefore be $\frac{30}{143} \times 24 = 5+$ volts above the ground potential.

As the tip of the plug of the testing operator is exactly at ground potential when it is touched to the sleeve J^2, a current with an electromotive force of between 3 and 5 volts, the amount depending upon the condition of the line and battery, will pass through the tip strand of the cord circuit, producing the familiar busy test click by its action upon the operator's receiving circuit.

THE EDITOR'S PAGE

MULTIPLYING PROFITS.

THE efficient management of modern business enterprises depends much upon the elimination of delays. Edward B. Easton, general manager of the Columbia Phonograph Company, called attention to this fact in a very practical manner in an article which appeared in the current number of the magazine *System*. Mr. Easton has built up for his company a method of handling business which enables him to keep in the closest touch with all of the different departments and agencies.

By a plan which brings to his desk each day detailed reports he learns what is going on within an extremely short time in each branch of the company's business, no matter whether it is a department located in the same building with his office, or a foreign agency. These reports enable him to have at hand all information necessary for the determination of the proper line of action to pursue in the regular routine or in cases of emergency. After considering them it is important that all orders which are issued should reach the persons for whom they are intended with the smallest possible loss of time, and this the general manager accomplishes.

The telephone he has found to be one of the most important aids to the successful development of his plan for controlling the work of the company. He uses it constantly for getting into communication with the officers associated with him in the management of the business, and frequently urges the extension of its use by his subordinates. The superintendent of the shops may have an idea which is likely to effect a saving of a certain amount each day in the cost of manufacture of a given article. In order to put his idea into effect, it is necessary that he should receive the approval of some superior officer. Mr. Easton says that he should use the telephone. Then the matter is brought up as soon as the idea is formed; and, if it is a good one, it is given immediate consideration and approval, and is put in operation. The result of this is that a telephone message, costing almost nothing, results in the introduction of an economical process in a time which is from a single day to several weeks shorter than would be the case if it were brought up by correspondence. Each day that is saved represents a certain definite, and possibly large, saving in the expenses of the company, which is the difference in cost between the old method and the new. The percentage of profit on such a telephone message is enormous.

For use between offices in the same building the telephone also effects most important economies. In handling a given matter by correspondence, it is well known by all business men that whatever delays occur are not due to the time which is spent in the actual consideration of the subject upon which information is being gathered. The time that is lost is partly that which elapses while the papers bearing upon the matter are lying in one office after having been considered, waiting to be carried to the next person who will take up the affair.

When they reach the second man's desk there is a still further delay, which continues until he is able to direct his attention to the papers at hand. After examining them it is usually necessary for him to gather other correspondence and data which bear upon the case; and, as these data are usually obtained as the result of written applications, it is necessary that a certain delay should take place before the demands can be put upon paper. Still more time is lost in taking the request for information to the persons who are to gather it; after it has reached their desks there is a still further delay until they can take it up, and so on in an ever widening circle.

Telephone companies can find no better means of increasing the number of calls which they are to handle than by taking every opportunity to impress these facts upon the more conservative business men. There are still many large firms which do not understand that the success of competitors and others, which they so much admire, is due to the elimination of delays. They should be made to realize that a loss of time frequently represents an enormously disproportionate loss of profit, which could be saved by the use of the telephone.

IMPROVEMENTS FROM DISCUSSION.

CONVENTIONS give opportunities not only for learning methods of developing territory and gaining new business in a manner which is for the best interests of all the operating companies represented, but afford most valuable facilities for learning the advantages and defects of various methods of operation, construction, maintenance, etc. It is unavoidable where the system of handling details of work is controlled by men who are not closely associated, that considerable differences should exist. Methods will be built up which present important advantages and give good satisfaction to both companies and subscribers. When an Independent operator has devised good systems, it is to his interest to make them generally known to his associates. This is essential because the extension of his toll business demands that the companies with which he connects shall give as good service as his own. It is to his interest, therefore, to devote attention to their improvement as well as to that of the system owned by the company with which he is more directly concerned.

The discussion during the progress of association meetings enables operating men to take up various questions and consider them from every point of view. Thomas D. Lockwood, in a recent talk before the American Institute of Electrical Engineers, referred briefly to the early history of telephone development, when there were as many different circuits in use and different ways of handling business as there were exchanges. Each of these plans had been devised by the man controlling the exchange, who was in the habit of vigorously urging claims that his own was the very best system in use. It finally occurred to a number of the leaders, of which Mr. Lockwood was one, that there could really be only one best system. This led to a discussion, which was intended to be as fair and impartial as possible, with the object of picking out the genuine merits of each plan. From this time is said to have dated the consistent development of telephone engineering.

There still remain many differences of opinion which need to be adjusted, many special applications of different schemes which admirably suit different conditions, and which are not generally known, and many cases where no satisfactory plan for avoiding difficulties has been devised. It is extremely desirable, for the general development of the work, that these points shall be understood as thoroughly as possible by all men. This understanding should be not necessarily an agreement, but will enable each man to hold opinions based upon a foundation which is known to cover the idea from every point of view which can be suggested by interested persons. It is here that discussion at conventions, on account of the freedom which is possible, is of the greatest benefit to the operating men.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

NEGLIGENCE WHERE WIRE BREAKS FROM CONTRACTION.

I find your answers to questions on telephone law to be very helpful, and this alone is well worth the price of the paper.

I would like to ask a question in regard to a case where a telephone wire in town broke during a cold night from contraction and a kink in the wire; early the next morning, before working hours, a pedestrian while crossing the street ran into the wire. The wire caught in his teeth, throwing him down on his back, loosening his teeth and causing other injuries for which he proposes to collect damages. Is this a case of negligence on the part of the telephone company, and has he any grounds for action?

P. V. T. CO.

THE only point upon which a claim of negligence could be hung in the case you mention is whether the existence of the kink in the wire was due to the negligence of the company or not. If it was negligence for the company to allow a kink to remain in its wires in view of the fact of cold weather, which must be expected in your State (Nebraska), there would be a question for a jury, which would, of course, be likely to decide in favor of the injured man. The question for the jury would be whether cold weather is apt to contract wires to such an extent as to constitute a danger against which companies should provide. It was held that the negligence of the company was a question for the jury where a severe storm caused the sagging of the wire, into which plaintiff's wagon ran. Friesenham v. Mich. Tel. Co. 96 N. W. 501. On the subject of the contributory negligence of the pedestrian in crossing the street, see Miller v. Lewistown Company, 62 Atl. 32 in which case it was held that the traveler was not contributorily negligent.

LEVYING OF POLE TAXES ON FRANCHISED COMPANY.

About two years ago there appeared in the Legal Department of THE AMERICAN TELEPHONE JOURNAL a number of Court decisions holding that a municipality had no right to levy a special tax on poles of a telephone company after the granting of a franchise. We have this question up now and I will be much obliged to you for a list of decisions.

The question presented in our case is this:

Immediately after granting our franchise the City Council levied a tax or rather passed an ordinance requiring the payment of $1.00 per pole before permission to set poles would be given. I take the position that this was in violation of the franchise ordinance granted to our company and the contract between the municipality and ourselves when we accepted the ordinance. The ordinance itself imposed certain conditions by way of special tax on gross income and certain concessions as to number of free telephones granted to the municipality. E. B. J.

THE foundation upon which the authority to levy pole taxes rests is the supposed expense of regulating them on the part of the city. A tax upon poles over and above the expense of the regulation of them is not valid, but the courts uphold the levying of such an assessment per pole as will pay the expense to the city of police regulation, and the power under which municipalities are permitted to collect these fees is the police power. The following cases bear upon the subject: Memphis v. Postal Telegraph Company, 139 Fed. 707; Wisconsin Telephone Company v. City of Milwaukee, 104 N. W., 1109, in which it was held that license taxes upon poles in Milwaukee were void because the city was without authority to impose them; Pensacola v. Southern Bell Telephone Company, 37 Southern 820; Shellburg v. Western Union Telegraph Company, 26 Penn. Sup. Ct. 343, enumerating the elements that enter into a valid license tax; Burrough of Kittanning v. Western Union Telegraph Company, 26 Penn. State 346. In this case an ordinance imposing a pole license tax was not void because not restricted in express terms to poles and wires maintained upon highways and public property; City of Fort Smith v. Hunt, vol. 10, AMER. TEL. JOURNAL, No. 16; Postal Telegraph Company v. New Hope and Postal Telegraph Company v. Taylor, 5 Advance Opinions, U. S. Sup. Ct. 205; St. Louis v. Western Union Telegraph Company, 148 U. S. 92, 149 U. S. 465.

ANNEXED TERRITORY ENTITLED TO CITY RATES.

THE Supreme Court of Illinois has rendered a decision in the case of the People v. the Chicago Telephone Company. This company was chartered in 1889, and the charter contained a provision that the rates for telephones should not be advanced from the rates specified in the franchise. Since 1889 many improvements in service have been made, and the company made new contracts with a number of patrons for improved metallic circuit service, for which the company charged $50 per head per telephone in addition to the rate of $125 per year provided in the charter. The company also extended this service to several suburbs in which it had franchises, without any rate limitations and which were subsequently annexed to the city of Chicago. Quo warranto proceedings to forfeit the charter of the company were instituted in the Cook County Circuit Court, dismissed by that court, and appealed to the Supreme Court.

The Supreme Court holds that the company cannot charge rates in excess of those provided for in the ordinance granting the company its franchise, no matter what improvements it makes, and that the service must be given the suburbs which have since been annexed to the city at the same rate which prevails in the city. It says that the ordinance applied to all within the limits of Chicago and made no exclusion of territory that might come in later.

As to the service, the court says that the words of the ordinance are general and on their face include every kind of service and the court sees no warrant for saying that they do not include any improved service adopted by the company. To construe the ordinance as the company would means that whenever any improvement is made in service the company rids itself of all its rates and still enjoys the benefit of the ordinance. The court holds that the pleas set up do not warrant forfeiture of the franchise, but it directs the lower court to enter orders in accordance with the decision.

TO RECOVER PENALTY FOR DISCRIMINATION.

THE Attorney General of Wisconsin has started action against the Wisconsin Telephone Company for the recovery of $500 provided for by chapter 389 of the laws of 1905, to prevent one telephone company from charging a greater rental in one city than for like service in another city of the same class. The Wisconsin Telephone Company operates in some 30 cities of the state. The Independents endeavored persistently during the last three sessions of the legislature to obtain the passage of a bill to prevent discrimination. The Bell people resisted the movement Finally, in the session of 1905, a law was enacted classifying cities of Wisconsin according to size, and providing that any company maintaining exchanges in more than one place should charge the same price for like services of the same class. The offense alleged is the charging of higher rates in Beloit than in Janesville.

IN THE OPERATING FIELD

INDIANA MEETING RESULTS IN ACTION TO INSURE STRICT INDEPENDENCE.

THE second quarterly meeting of the members of the Indiana Independent Telephone Association for the first district was in Elkhart on February 26. Affairs in the district were declared to be in excellent condition and twelve delegates were selected to attend the annual State meeting. Vice-President Thorward and Secretary Crow were reelected.

The following resolution was unanimously adopted:

"Resolved, That any telephone company in the first district having either direct or indirect traffic relations with the Central Union (Bell) Telephone Company, be cut off from all traffic relations with the Independent telephone companies of this district, providing such company refuses to sever its connection with the Bell company after receiving due notice to do so from the president and secretary of the district association."

BELL UNABLE TO RETAIN CONTROL OF TERRITORY ACQUIRED BY SUB-LICENSE CONTRACT IN NEW YORK.

SINCE the alliance of the Orange County (N. Y.) Telephone Company with the Bell interests the Middletown Telephone Company has been organized to give Independent service in Middletown and the surrounding district. This company intends to operate in connection with other Independent companies in Orange and Lowell counties in establishing an exchange in Middletown and has constructed a connecting line from Goshen to Middletown. The company obtained a right to enter the city in the face of vigorous opposition from the Hudson River Company. As soon as it was found, however, that the new company was aware of its rights under the laws of the State and able to procure them the efforts to prevent its entrance ceased.

The stockholders have chosen the following directors for the ensuing year: Dr. M. C. Conner, Dr. Edwin Francher, G. B. Potter, Galen Coleman, W. G. Comings, Dr. G. B. Hewlett, F. B. Walsh, C. A. Ketcham and W. C. Ramsdell. The new company has the confidence of the people, who have been so recently tricked by the sub-license arrangement, and will be able in a short time to build up an excellent system.

NEW COMPANY PROPOSES TO BUILD UP EFFICIENT SYSTEM IN PERRY COUNTY, OHIO.

THE Citizens' Independent Telephone Company, of New Lexington, was recently incorporated with a capital stock of $50,000 and promises much to the residents of Perry county.

The following directors were chosen: W. L. Cary, Jr., T. F. Wilson, J. L. Hoffman, S. M. Granger, John Mangan, T. J. Smith and J. B. Rhodes. The directors organized by electing the following officers: W. L. Cary, Jr., president; S. M. Granger, vice-president; T. J. Smith, secretary and general manager; J. B. Rhodes, treasurer. As the officers of the new company are men prominent in Independent telephone affairs in Ohio, the building up of a comprehensive and efficient service is assured.

The president for this company is general counsel for the United States Long Distance Telephone Company and the Federal Telephone Company, together with its various subsidiary companies, including the Zanesville Telephone & Telegraph Company and the Lancaster Telephone Company.

J. B. Rhodes, who has been elected treasurer of the new company, is secretary and general manager of the Zanesville Telephone & Telegraph Company, president and general manager of the Crooksville Telephone Company, also in the same capacities with the Adamsville Telephone Company, treasurer of the Woodsfield Telephone Company, secretary and treasurer of the New Concord Telephone Company, besides being prominently identified with the newly organized company at Caldwell.

Arrangements are to be made immediately for the establishment at New Lexington of a modern telephone exchange that will be capable of accommodating the whole of Perry county. The many towns and rural districts will be connected with the New Lexington exchange, and from there secure connections with each other or with outside points.

LARGE GIFTS TO INSTITUTE BUILDING FUND.

THE chairman of the Land and Building Fund of the American Institute of Electrical Engineers, announces this week some very large and important contributions to this fund, the object of which is to raise $200,000 for the land on which the United Engineering building, given by Mr. Carnegie, is now being erected. The total cost of the land is $540,000, and the obligation is divided between the electrical, mechanical and mining engineers.

Mr. Clarence H. Mackay, president of the Postal Telegraph-Cable Company, has given $5,000 to the fund, accompanied by the expression of his interest in the building as a center whose facilities will be available to the various bodies of telegraphers. Mr. U. N. Bethell and Mr. J. J. Carty, members of the committee, have advised it on behalf of the American Telephone & Telegraph Company, the Western Electric Company, the New York & New Jersey Telephone Company and the New York Telephone Company, that these corporations have jointly contributed $25,000 to the fund, in view of the great benefits that the existence of this new engineering center will confer upon the electrical arts and upon their employees in the widening field of telephone engineering.

Other notable gifts to the fund are $1,200 from Mr. E. W. Rice, Jr., and $500 from Mr. T. D. Lockwood. A number of subscriptions of lesser amounts have been received from the institute membership at large, and in this manner the fund has now reached the total of over $130,000, or two-thirds of the required amount. With the campaign it has already inaugurated, and the plans now maturing, the committee is hopeful of having the entire sum pledged before the institute moves into its new home.

BELL OUTWITTED IN KENTUCKY.

INDEPENDENT development in the South has recently received a new impetus through the efforts of J. E. Zeluff, of Birmingham, Ala. Mr. Zeluff, who is superintendent for the Central Telephone Construction Company, recently gave the Bell Company a most effective setback at Russellville, Ky. At this place the Bell had for a long time successfully opposed all efforts for the establishment of an Independent system. The manager of its exchange had held the position from the outset and had been mayor of the city for the past seventeen years. The whole council was also extremely sympathetic with the Bell interests, and it is doubtful whether the Independents would have been able to gain a foothold had not the Bell pursued its usual practice of giving poor service with antiquated equipment.

The townspeople were thoroughly disgusted with the actions of the company, and were in favor of an Independent system. Throughout the rest of the State the Independents are particularly strong and the business men realized that a large amount of

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE—Telephone exchange, 150 telephones. Town and part of country lines rebuilt new. Good territory. Town growing. Population of town 500. Address Turon Telephone Company, Turon, Kan. 570

FOR SALE—Cheap, 9 sections, American Electric, express, magneto switchboard; we will sell one or all; 500 magneto telephones; 100 magneto desk sets; 200 generators, all types; 100 bipolar receivers; 200 ringing coils; 80 to 120 ohm. Address the Tuscarawas County Telephone Company, New Philadelphia, O. 571

FOR SALE, CHEAP—600 pairs self-soldering protectors. Also one 300 pair and one 500 pair main distributing frame, used less than two months. Will sell separately or together. Address Virden Telephone Exchange, Virden, Ill., or Girard Telephone Exchange, Girard, Ill. 420

FOR SALE—1,800 line, multiple, lamp signal, Central energy switchboard of latest Stromberg-Carlson make. Just from the factory. Not yet unpacked. Terms to suit. Also modern telephone exchange and electric light plant in progressive South Carolina town of over 2,000 inhabitants, $14,000; $3,000 cash; balance on easy terms. Piedmont Electric Co., Anderson, S. C. 563

THE Armstrong Telephone Exchange Company wishes to bond their company for $5,000, and wishes to correspond with any company who is interested in making loans. Address R. O. Armstrong, Secy., Truman, Minn. 568

FOR SALE—Switchboard and apparatus, outgrown and displaced by automatic equipment: Kellogg switchboard, twenty 8-panel, 3-position, mahogany, equipped for 5,200 main lines, ultimate capacity 6,000 lines; Kellogg toll board of 9 positions; Kellogg telephones, 4,064 wall and 2,136 desk; Sterling terminal rack, with protection; power plant, with charging and ringing machines and storage batteries; offered for sale in whole or in part. For particulars address The Columbus Citizens' Telephone Company, Columbus, Ohio. 548

FOR SALE—300 Eureka Express Switchboard drops and other parts. Kellogg Keys. Write for prices. The Lyons Telephone Co., Lyons, Kan. 573

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

A SQUARE deal is what we aim to render both employer and employee, when seeking the right man for a place, or the right place for a man. Without effort on your part, without endangering your present position, and without using your employers' time, we hunt up the position for which you are best qualified. Let us find the position for you. Hapgood's, Suite 511, 309 Broadway, New York City. 464

WANTED—Two experienced inspectors for central energy system in middle west. Must be hustlers and well recommended. Address Box 564, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 564

WANTED—Position as manager. Have had 14 years' experience in all branches of the business from the ground up. Past eight years have managed and superintended construction. Married and temperate. Very best of recommendations. Address M., 2119 A, Cass avenue, St. Louis, Mo. 552

WANTED—Wire chief for Central Energy system in middle west; state experience in this class of work. Address, Box 567, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 567

WANTED—Correspondent. Must be able to write strong, forceful letters—the kind that turn inquiries into orders. Experience in dictating telephone and switchboard letters on magneto and non-multiple central energy apparatus necessary. Will pay good salary to right man. Give full particulars. Largest Independent company. Address, Box 562, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 562

WANTED—Position by an all round cable splicer and switchboard man. Best of references furnished. Address Frank R. Rice, Menomonie, Wis. 572

WANTED—Position as chief operator. Have had 10 years' experience. Can furnish best of references as to qualifications. Address Box 574, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 574

Digitized by Google

trade was being diverted to other points on account of lack of Independent connections.

To enable the Independents to come into the city a new mayor and council were nominated and run on the Independent telephone platform. At the primaries it secured a unanimous vote, which gave it a majority of over 200. The Bell, realizing its defeat, immediately set to work and circulated promises by the score. New construction was started and rebuilding of the entire plant was commenced. At the same time it began to secure names for a petition to be presented to the new council protesting against another telephone franchise, but all without avail. The franchise granted the Independent company is exactly the same as the one under which the Bell is operating, and will enable it to do business without let or hindrance. An amusing feature of the contest was the protest made against the granting of so liberal a franchise to the Independent company, when it contained not a single privilege denied to the Bell.

MERGER OF LARGE INDEPENDENT INTERESTS IN OHIO ANNOUNCED.

ANNOUNCEMENT was made at the annual meeting of the Columbus Citizens' Telephone Company that the company had perfected a lease of the plants, exchanges and rights of the Franklin Telephone Company. The lease was announced as of January 1, the property having been quietly taken over at that date without giving notice to the public, subject to ratification of the Franklin County Company stockholders. On February 20 the lease was unanimously ratified by these stockholders.

Comparative table of telephone situation in 29 Ohio counties. This is a continuation of the statement prepared by President F. L. Beam, commenced in our issue of March 3.

The owners of both systems have been the same for some time, but the lines have been managed by different directorates, although members of one directorate have at various times been on the other board. The same board now directs the affairs of both companies, and the same officers conduct the business, while the accounts are kept separately.

The combined companies have a list of 10,000 subscribers in Franklin County, on the city, village and rural lines. The exchanges thus consolidated with the Citizens' companies are those of Worthington, Westerville, New Albany, Gahanna, Reynoldsburg, Pickerington (in Fairfield County), Canal Winchester, Groveport, Lockbourne, Grove City, Harrisburg, Galloway, Hilliards and Dublin. Seth L. McMillen was president of the Franklin County company, and Ralph Reamer was secretary.

The basis of the lease is a guaranteed dividend of 5 per cent. annually on the stock, $150,000 par value.

The Citizens' Company elected a Board of Directors as follows: Henry A. Lanman, John Joyce, Edwin R. Sharp, Frank A. Davis, J. B. Hanna, L. D. Haggerty, C. C. Griswold, Harry M. Daugherty and Frank L. Beam. The board organized by the election of Henry A. Lanman, president; John Joyce, vice-president; Edwin R. Sharp, secretary and treasurer; Frank A. Davis, general counsel, and Gansey R. Johnson, general manager.

C. H. JUDSON TO HANDLE DEVELOPMENT OF INDEPENDENT PLANT AT SEATTLE.

THE Seattle, Wash., Independent Telephone Company has recently put its engineering work in charge of C. H. Judson. He is now chief engineer of the company, and expects to remove to Seattle within the next two months to take up his permanent residence there. His experience in the construction of the high grade plants in St. Paul, Minneapolis, Kansas City, Des Moines, Council Bluffs and other important places will enable the company to meet the exceptional demands for rapid construction imposed by the necessity of giving service to a list of subscribers which is increasing with extraordinary speed. The recent citizens' movement against the Sunset Company is likely to result in a sudden extension of the plant of the Independent Telephone Company at a rate which has been unequalled in the history of the Independent movement. Mr. Judson himself says that the company's business is growing so rapidly that it is going to require all the men and material that they can lay their hands on to keep up with the contract department.

COLONEL DICKSON LEAVES THE TELEPHONE FIELD.

FREDERICK S. DICKSON has recently associated himself with a brokerage firm, and will shortly undertake the management of its business in Cleveland. He has tendered his resignations as president of the various telephone companies of which he is now the head, and expects that these resignations will be accepted as soon as successors have been decided upon.

Mr. Dickson was placed in charge of the telephone companies at a time when their financial condition was especially weak, and he has succeeded in building up each of the properties which he has managed to a place where it is able to stand on a firm and substantial basis. The companies have developed rapidly in the face of determined opposition. He has given good service and won the confidence of the public, both as subscribers and as investors.

The companies with which he has been associated will still have the benefit of the strong and active organization of able and well trained men, which he has built up since he came into control. He leaves the telephone field as one who has most ably and completely accomplished an important and useful task. Col. Dickson in a recent letter to THE AMERICAN TELEPHONE JOURNAL stated that he desired to express his gratitude for the many acts of courtesy and generous treatment at the hands of his telephone brethren throughout the United States, and to say that his connection with the telephone business had been most agreeable to him personally.

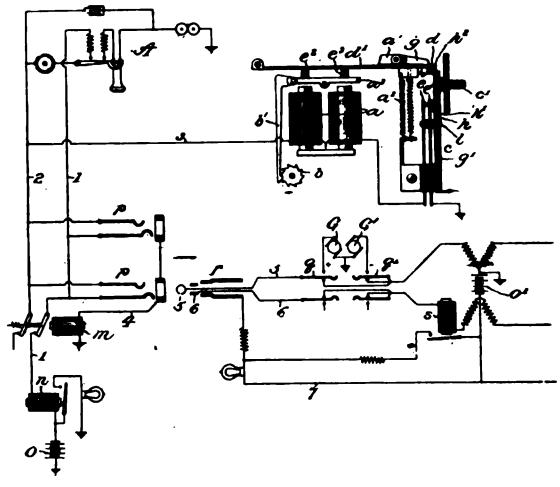
TELEPHONE PATENTS

SERVICE METER.

Frank R. McBerty, Evanston, Ill., and Edward B. Craft, Chicago, Ill., patent (No. 813,230; dated Feruary 20, 1906; filed June 10, 1905; serial No. 264,565) and assign to the Western Electric Company, of Chicago, Ill., a service meter for telephones.

The object of this invention is to provide means at the substation for recording the number of completed calls by an instrument which shall be under the control of the exchange operator after the calling party has first operated the mechanism which lights his line lamp. Referring to the illustration, the meter consists of a polarized electro-magnet *a* provided with a centrally pivoted armature a^3. This armature when tilted in one direction operates, by means of the lever or pawl b^1, the registering train *b*. A switch, *c*, is provided to control the circuit connection of the magnet *a* and is operated by plunger c^1. When the plunger is depressed catch *d*, carried by arm d^1 which is pivoted on post a^1, locks the switch springs in such a position as to close contacts *e* e^1.



The armature carries two studs adapted to operate the arm d^1 according to the movement of the armature. A spring, a^2, normally holds the arm against the studs.

To prevent the mechanism being tampered with after the button has been depressed, a guard *g* is interposed between the tension or operating member g^1 and the button.

In operation the receiver is removed from the hook and the button c^1 depressed, which locks the switch springs *e* e^1 in position. A circuit is then completed from battery *O*, through line relay *n*, over conductor 1, instrument *A*, wire 3, magnet *a*, switch springs *e* e^1 to ground. The line relay is thus energized and closes the signal circuit. The service meter is arranged not to respond to current from battery *O*. When the operator answers the call by inserting the plug *r* in the jack *p*, the cut off relay *m* operates and the line circuits are connected to wires 5, 6. If the call is completed the proper key, either *q* or q^1, is depressed, to send current of the right polarity to energize the magnet *a*, causing it to tilt its armature in the direction to operate the registering train *b* and release the switch springs *c* c^1. If, however, the call is cancelled, the opposite button would be operated, causing current of a reversed polarity to traverse the windings of magnet *a*, which thereupon tilts its armature a^3 in the other direction, releasing the switch springs, but not operating the registering device.

PARTY-LINE SYSTEM.

Edward A. Buell, De Kalb, Ill., patents (No. 811,691; dated Feb. 6, 1906; filed Mar. 17, 1905; serial No. 250,621) a party-line selective system.

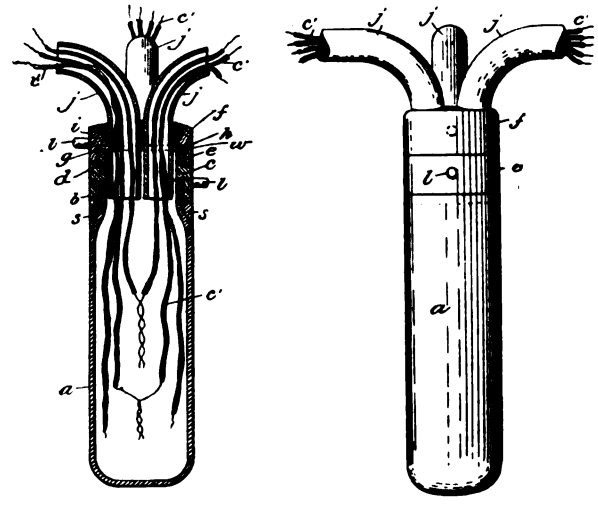
This invention relates to that class of selective systems employing step by step mechanism. Two magnets are employed, one of which operates a ratchet wheel to close or open local circuits, and the other governs the relation of the circuits through the former magnet. A special key at the exchange is provided by means of which the operator can connect the instrument of a party calling to the line, and also select any party.

Under normal conditions the signaling generator alone is capable of being connected to the line without the aid of the operator; thus secrecy is secured.

CABLE SPLICING DEVICE.

Charles E. Teush and Luther Hargis, Evansville, Ind., patent (No. 802,337; dated October 17, 1905; filed March 27, 1905; serial No. 252,330) and assign one-third to Charles M. Katterjohn, Evansville, Ind.; a moisture proof covering for the terminals of armored cables.

The object of this invention is to provide means whereby the terminals or splices of cable wires can be protected from moisture by a covering which can be readily removed and replaced when inspection is necessary. The covering for the joint consists of a lead tube, or casing, *a*, which is permanently closed at one end. The end of the case through which the wires enter is provided with a brass crown *c*, designed to be attached to the main portion by means of the offset *b*, which is to be "sweated" firmly to the case *a*, and reinforced by solder, *s*, if desired. The crown is provided with a shoulder *d* and threaded portion *e*, which engages with the tapped interior of a cap *f*. A leaden gasket *h*, attached to the middle of the interior of the cap, is provided with as many holes as there are to be cables to be spliced or terminated at this point. The upper interior portion of the cap is bevelled off to form a shallow cup, as shown at *i*.



In use cables are introduced through the openings in the gasket. Hot lead is then poured into the cup above mentioned, to attach the cables firmly thereto, and to prevent the entrance of moisture. After the splice is completed the casing *a* is placed over the wires and screwed down tightly upon the cap. A rubber or other suitable washer *w* is interposed between the edge of the casing and the leaden seat to make a completely moisture-proof joint.

TO GET THREE OUT OF TWO SEEMS IMPOSSIBLE

Yet the Illinois and Sandwich Duplexers easily make two metallic circuits into three

Just stop and think what this means to you in increased facilities without spending a cent for new line construction.

Here are the facts in the case: By connecting our duplexers to the two existing metallic circuits a new one is formed which utilizes each pair of wires as one side of an independent metallic line.

To eliminate all noise due to induction we provide a very simple and efficient balancing device which requires no skill in its manipulation and which will make the new circuit absolutely quiet.

Seems almost too good to be true. Let us prove it by sending a set on 30 days free trial.

We know you are interested; therefore don't delay, but write to-day

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

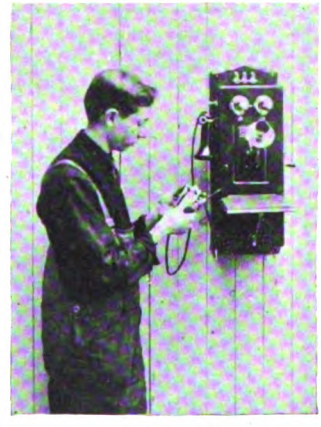
CONDENSERS FOR PARTY LINES.

FOR bridging telephone systems the use of a condenser at each station is said to do away with one of the most prevalent difficulties which impairs the operation of party lines. The tendency on the part of telephone users to forget to hang up their receivers is the cause of frequently occurring trouble. Moreover, it is said that upon lines which go through districts which are thickly settled, a ring upon a line is very likely to cause more than one person to take down his telephone and listen. Although each of the listeners will no doubt deny any intention to attempt to remain on the line and overhear the conversation, the fact remains that if the party desired does not respond to the first ring it is very difficult to obtain him afterward. The trouble in each case is due to the fact that the ringing current intended for his bell is shunted through the receivers of all of the other listeners.

The condensers manufactured by Julius Andrae & Sons Company, 99 Second street, Milwaukee, Wis., are designed to be installed in the receiver circuit, and do away with the difficulty we have mentioned. By their use it is said that the bells will give a strong ring even when several receivers are off the hook.

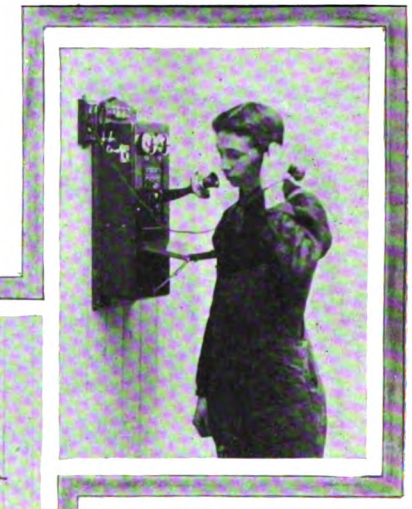
The company makes several types of condensers, which are adapted to various locations. One type, the "Special" condenser, is so small that it may be readily installed inside of a bridging magneto box. This is for use where the instrument is crowded into a small space. The "Standard" condensers are uniformly designed to withstand a voltage of 300, alternating current, without injury or appreciable leakage. These are hermetically sealed in a metal box. The "New Form" condenser is fitted into a polished quarter sawed oak case. This makes a very attractive appearing instrument, which may be installed by simply mounting it upon a wall, and rearranging the cords on the exposed binding posts in accordance with the directions which accompany the instrument. That this process is very simple may be seen by the illustration, from which an idea of the entire labor necessary for its installation may be gained. The manufacturers state that these condensers have been widely used, and have given great satisfaction. They will be pleased to furnish further information and prices to all persons who wish to learn more about the uses of condensers.

Only a Screwdriver is Needed to Install the Andrae Condenser.



It is Mounted on Wall Beside the Telephone.

Connection is Made by Rearranging Cords.



A Brief Test and the Work is Done.

THE SWEDISH-AMERICAN TELEPHONE COMPANY, Chicago, Ill., which has moved into its new factory, reports that its business is each day showing a substantial increase. The new structure contains about 200,000 square feet of floor space, which is devoted to the exclusive manufacture of telephone apparatus. Telephone men visiting Chicago are invited to call on the company and see for themselves the actual process of manufacturing telephone apparatus.

FRANK B. COOK announces that he has received the approval of the National Board of Fire Underwriters on his Type B-4 Subscribers' Station Protector. The Type B-4 protector is equipped with Cook's new tubular fuses, with improved carbon lighting arresters, and with sensitive heat coils. All parts are mounted on a heavy porcelain base. It is claimed that the new tubular fuse does not explode, does not give a flash, and does not continue the arc when blown. These fuses protect against heavy currents. The carbon lightning arrester is provided with a perforated celluloid dialectric, in which the perforations are so small and so numerous that the discharge is greatly broken up, and is forced to pass through the arrester at many points. This is designed to prevent particles of carbon from breaking off and short-circuiting the arrester. If an arc continues through the arrester, due to a cross with a high voltage circuit, the celluloids will melt and allow the springs to press the carbon blocks together and form a dead ground through the arrester. This stops the arc, after which, if the current increases sufficiently, the tubular fuse will blow and entirely cut out the instrument from the circuit. Sensitive heat coils are provided for protection against sneak currents.

THE CENTRAL TELEPHONE AND ELECTRIC COMPANY, St. Louis, Mo., has issued the third in the series of monthly pictorial calender cards. These cards have met with great popularity on account of their useful and artistic qualities. The company em-

FACTORY: BROOKLINE, MASS.

THE VALUE OF A MEASURING INSTRUMENT

Suppose you have a line in trouble—grounded or open. You don't know the exact location, but you send out a troubleman to hunt it up and clear it. It may take him an hour or a day. Meanwhile the subscriber is getting hot under the collar and saying things about telephones in general and yours in particular.

If you have a Pignolet voltmeter or volt-ammeter you can determine the approximate location and also get an idea of the nature of the trouble. With the information your troubleman can find the fault in jig time, and you will have prevented the subscriber kicking by giving him service at the earliest possible moment.

Does it pay to be informed? You ought to know.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit
78 CORTLANDT ST., N. Y.

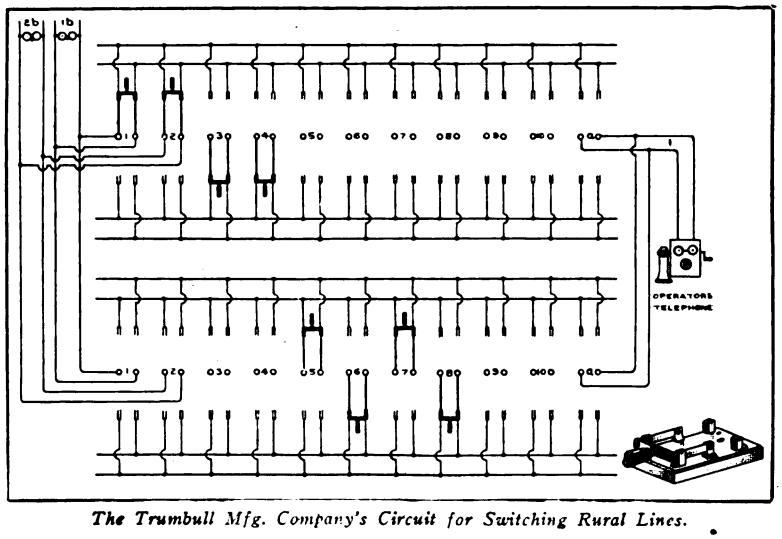
ploys them to introduce its product to the trade, and this month calls attention to its ability to make quick shipments. Parties interested can have their names places on the mailing list by addressing the company.

SWITCHING CIRCUITS FOR RURAL SYSTEMS.

ONE of the first subjects that comes up for discussion after a telephone company is organized is "How large a switchboard shall we install?" If the company is going to operate in a rural district, the number of subscribers that can be secured is very indeterminate; it may be five or one hundred. If a board having only a sufficient capacity to handle the former number is installed and more people want service, then it is necessary to add another board or else discard the one in use and put in one of sufficient capacity. With a small company this is an expensive proposition. A method submitted by the Trumbull Electric Manufacturing Company, Plainville, Conn., is herewith described. While extremely simple in operation, it is nevertheless claimed by the manufacturers to answer the same purpose as a small switchboard. Its principal feature is the use of Trumbull double throw knife switches.



The Trumbull Mfg. Company's Circuit for Switching Rural Lines.

In the illustration, ten lines are shown connecting to twenty switches in such a way that four parties can be talking to four others without interference. The lines are connected to the knife blades of the switches, two switches being wired to each line in multiple. The spring contacts on each end are connected to a pair of wires so that the corresponding contacts for all the switches in one row are wired in multiple. An operator's listening telephone is connected to the end switch, marked *a*, of each line. To simplify the illustration, only two lines are shown. Supposing station 1 desires a connection. He will signal the exchange by means of the extension bell 1 b. The operator will then throw one of the switches connected to the line on which the call is received into contact with one set of end springs, then by throwing the switch of the operating telephone in the same bank in the same direction, he will be able to talk to the calling party over the connecting wires. Now, if station 2 is wanted, the operator will throw the switch for line 2, which is in the same bank with the switch first operated into contact, with a set of springs connected to the connecting or bridge wires not in use, connect his instrument to the same side and ring. When the party answers, he will open his switch and throw the switch of line 1 completely over, connecting lines 1 and 2 to the same multiple leads. Disconnection signals are received over the extension bells.

This, it will be seen, is a very simple arrangement which can be easily constructed by any one. The manufacturers claim that it is extremely economical, as there is no expense for cabinet, plugs, cords, etc. New switches may be installed by any one as they are needed. In the matter of repairs, there are no difficult adjustments to be made, and in fact, as there is no delicate apparatus used, there is nothing to get out of adjustment, or wear out.

At the time when greater facilities are required on account of the growth of the exchange, and a switchboard is installed, the switches will be found useful at subscribers' stations to open and ground lines during storms and around the exchange for various uses. The Trumbull switches are said to be particularly adapted to this work on account of their construction, which always insures clear and positive contacts.

SPECIAL BUSINESS STATIONERY.

THE stationery and forms which are used by telephone companies for purposes which make it necessary for them to be seen by persons not closely connected with the management must be not only correctly designed from business, and legal standpoints, but must be attractive in appearance. The Edwards-Hine Company, 5 and 7 Pearl street, Grand Rapids, Mich., has devoted considerable attention to paper of this class, and has produced some forms which are claimed to be admirably suited to the purposes for which they are designed. Amongst these forms may be mentioned bonds, stock certificates, vouchers, letter heads, etc.

On these forms the company has printed, by a lithograph process, special designs. The sheets are made up in very large quantities, and, upon receipt of an order it only remains to print the name of the company which is to use the forms in the space reserved for that purpose. In this way the Edwards-Hine Company is able to supply papers for various purposes upon short notice. It states, also, that as it does not have to make up a design and have cuts made, etc., for each order its prices are much lower than can be obtained by managers who have a special design made, and are obliged to pay for printer's material for a single line of work.

The various forms which are issued to the public are printed with an attractive design, which makes prominent use of the Independent shield, thus securing the full advertising value of the emblem. Stock certificates, bonds, etc., are arranged to properly comply with the laws governing the forms of these papers. The company also has a special line of forms for construction blanks, distribution of material, etc., which have been designed after a wide study of proper methods. The company states that these forms have been in use for a considerable time by many well conducted telephone companies, and have given much satisfaction. It will be pleased to give further information upon receipt of requests.

THE CENTURY TELEPHONE CONSTRUCTION COMPANY, Buffalo, N. Y., has designed an attractive celluloid instruction card, for attachment to the face plates of transmitters. On it is printed "Use this 'phone for long distance" and the Independent emblem. The lettering is printed in blue and the shield in red, white and blue. For Independent companies which are anxious to keep a reminder before their subscribers who have two telephones, it is very useful. A sample will be sent without charge to interested persons.

THE RUBBERING DAYS ARE OVER—SHE CAN'T HEAR A WORD

BUYING TELEPHONES IS A SERIOUS BUSINESS

Most every manufacturer has some particular feature which he extols, and the consequence is that the buyer is at sea unless he is well versed in the why and wherefore.

Now we make a telephone that differs from most others in that no part is better or worse than any other. It is good all the way through. Of what use is a loud talking transmitter if the receiver is weak, or a powerful generator if the ringer only tinkles? No use at all. Columbia telephones are the ones you should buy because they can hold up their end with the best of all others, and will be giving service when the so-called telephones of quality are in the scrap heap.

Just drop us a line to show you are interested and we'll tell you some things worth knowing.

MINNEAPOLIS, MINN.—The Tri-State Telephone & Telegraph Company has declared its eleventh quarterly dividend at the rate of 6 per cent. per annum on the preferred capital stock.

PIKE, N. Y.—The Pike Telephone Company is contemplating increasing its capital stock to $10,000.

SHELBY, O.—The Shelby Telephone Company has increased its capital stock from $60,000 to $75,000.

WILLOW, OKLA.—The Willow Telephone Company has increased its capital stock from $1,000 to $10,000.

SHERMAN, TEXAS.—The North Texas Telephone Company has increased its capital stock from $10,000 to $20,000.

FRANCHISES.

MT. CARROLL, ILL.—The Mt. Carroll Telephone Company has applied for a franchise to construct telephone lines in and about Mt. Carroll.

EVANSVILLE, IND.—Clifford Arrick, of Indianapolis, has applied for a franchise for an Independent company at Evansville.

OAKLAND CITY, IND.—A twenty-five year franchise has been granted to Charles F. Stevens to operate a telephone exchange at Oakland City to compete with the Cumberland Company.

CORNISH, I. T.—The Chickasaw Telephone Company, of Chickasaw, I. T., has been granted a telephone franchise at Cornish.

ST. CLOUD, MINN.—The Tri-State Telephone Company, of Minneapolis, is endeavoring to obtain a franchise at St. Cloud.

ANACONDA, MONT.—Frank H. Stow, of Portland, has applied for a telephone franchise at Anaconda.

STILLWATER, OKLA.—The Fairview Telephone Company, of Fairview, Okla., has been granted a franchise at Stillwater.

IRENE, TEXAS.—Thomas Kay, of Hillsboro, Texas, has been granted a franchise to construct a telephone system at Irene.

TUMWATER, WASH.—The Tumwater-Black Lake Suburban Telephone Company has been granted a telephone franchise at Tumwater.

COMBINATIONS.

MORVEN, N. C.—The Wadesboro Telephone Company has sold the Morven Telephone Exchange to W. E. Pennington, of McFarlan. Mr. Pennington also owns the McFarlan exchange and the line from Wadesboro to Cheraw.

DU QUOIN, ILL.—The DuQuoin, the Anna, the Marion and the Carbondale telephone companies have passed into the possession of the Mississippi Telephone Company of Carbondale.

ELECTIONS.

HERRIN, ILL.—The Herrin-Cartersville Telephone Company has elected the following officers: Thomas M. Logan, of Murphysboro, president; Alex. Thompson, of Cartersville, vice-president; Thomas M. Logan, treasurer; Alexander Thompson, secretary.

MASCOUTAH, ILL.—The Lookingglass Prairie Telephone Company has elected the following directors: H. V. Liebig, G. F. Wombacher, Philip Mann, George Richter and Otto Rumer.

STOCKBRIDGE, MICH.—The Munith-Stockbridge Farmers' Telephone Company has elected the following officers: Emanuel Hawley, president; W. T. Willmore, secretary; William Fink, treasurer.

BRANCHPORT, N. Y.—The Keuka Park & Branchport Telephone Company has elected the following officers: President, James H. Pepper; vice-president, E. Ben Knight; secretary and treasurer, Fred Culver.

CLINTON, N. Y.—The Clinton Home Telephone Company has elected the following officers: President, G. J. Cauldwell, Clinton; vice-president, George R. Fuller, Rochester; treasurer, C. H. Poole, Utica; secretary, G. A. Jackson, Utica; engineer, D. A. Cline, Utica.

SAVANNAH, N. Y.—The Savannah Telephone Company has elected the following officers: President, E. S. Wood; vice-president, E. P. Brown; secretary and treasurer, C. A. Coleman.

TOWANDA, N. Y.—At a recent meeting at Towanda the Bradford County Telephone Company elected the following officers: President, C. L. Tracy; vice-president, Ed. Davis; secretary and treasurer, E. M. Yarnall.

VAUGHNSVILLE, O.—The Local Telephone Company has elected the following officers: President, David Jones; vice-president, J. W. Edwards; secretary, D. L. Williams, Jr.

WALWORTH, WIS.—The Walworth Telephone Exchange Company has elected the following officers: President, H. S. Bell; J. Higbee, vice-president; W. C. Davis, secretary and treasurer.

NEW COMPANIES.

FORMOSA, KAN.—The Formosa Mutual Telephone Company has been incorporated with a capital stock of $7,500.

LOUISVILLE, KY.—The General Telephone Company has been organized to take over the Independent Long Distance and all smaller companies in Owensboro, Lexington, Maysville, Paris, Eminence and other points.

LIVERMORE FALLS, ME.—The Maine Telephone & Telegraph Company, Livermore Falls, has been incorporated with a capital stock of $25,000.

SAUK CENTER, MINN.—The Sauk Valley Telephone Company, Sauk Center, has been organized. The company is to construct thirty-five miles of line.

EAST SPRINGFIELD, N. Y.—The East Springfield Telephone Company has been incorporated with a capital stock of $10,000. The incorporators are Henry Rathbun, of Cooperstown; S. A. Young, H. W. Young and O. R. Young, of East Springfield.

LAPEER, N. Y.—The Lapeer Telephone Company has been organized with a capital stock of $2,000. The company will build a line from Lapeer to connect with the Killawod line and with the Dryden system.

NEW YORK, N. Y.—The Philippine Railway Construction Company, which is to build telephone lines in the Philippines, has been incorporated with a capital stock of $1,000,000. The incorporators are A. C. Wall, 1 Exchange place, Jersey City; E. B. Bruce and J. P. Carter, 52 William street, New York City.

PINGREE, N. D.—The Pingree Telephone Company, Pingree, N. D., has been incorporated with a capital stock of $50,000. Incorporators: James Price, Thomas Price, Oscar Boyd, O. H. Dahl, H. M. Dahl, Pingree, S. D.

RUSSELL, N. D.—The Russell Telephone Company, of Russell, has been incorporated with a capital stock of $5,000. Incorporators: A. J. Buchholz, M. A. Corey, Deep River, N. D.; John F. McKnight, A. D. Medhurst, J. K. Laporte, Russell, N. D.; E. V. McKnight, Sheldon, N. D.

FORT SENECA, O.—The Farmers' Mutual Telephone Company, of Fort Seneca, has been organized. George Gares, of Leipsic, is one of the incorporators.

LYONS, O.—The Lyons Mutual Telephone Company, Lyons, has been incorporated with the following incorporators: Frank Denson, S. Green, D. S. Knight, C. W. Carrel and others.

NEW WASHINGTON, O.—An Independent telephone company has been formed at New Washington, O., with the following officers: President, Henry Geissman; secretary, C. A. Hathaway.

NORTH STAR, O.—The North Star Telephone Company has been incorporated with a capital stock of $20,000. Incorporators: J. D. Hartzell, L. J. George, W. A. Roll and others.

SARDINIA, O.—The People's Telephone Company has been incorporated

NEWS—WANTED

THE matter contained upon the Message and Operating Field pages of this paper is contributed largely by our special correspondents. We believe, however, that there are many valuable items of telephonic interest which are never brought to the attention of the public. There is no reason why this condition should exist, and the Editor, therefore, invites all telephone companies and the officials of such companies, to furnish any information that they can consistently make public relative to financial statistics, new construction, elections, franchises and personal items.

OUR MOTTO—QUALITY AND PROMPT SHIPMENTS.

KELLOGG "MICHIGAN WHITE" CEDAR POLES

THE poles we handle are all carefully selected, and are the best grade of stock.

All shipments are prompt, subject only to car supply.

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices.

We have recently published a little book giving some very valuable information about Cedar Poles. It contains Specifications, Inspection Comments, Shipping Data, Etc. "Yours for the asking."

with a capital stock of $5,000. Incorporators: G. U. Kennedy, F. H. Slaughter, C. W. Frazier, M. E. Campbell and others.

OKLAHOMA CITY, OKLA.—The Southside Telephone Company, of Oklahoma, has been incorporated with a capital stock of $3,000. The following are the directors of the company: A. Spencer, Ed. Goodwin, Hugh Miller and C. F. Williams.

RICHLAND, ORE.—The Eagle Telephone Company, with main offices at Richland, has been incorporated with a capital stock of $840. The incorporators are E. A. Whittier, W. L. Gover and F. G. Jasper.

SALEM, ORE.—The Sunnyside Mutual Telephone Company has been incorporated with a capital stock of $1,500. The incorporators are A. L. West, L. M. Crozer and H. S. Poisal.

COGAN HOUSE, PA.—The Cogan House Telephone Company has been incorporated with a capital stock of $5,000.

MEADVILLE, PA.—The Eastern Crawford Telephone Company has been incorporated with a capital stock of $15,000. The officers of the company are: President, J. R. Andrews; vice-president, W. J. Maddox; secretary, H. M. Dickson; treasurer, C. S. Burwell and general manager John H. Wright.

ARMENIA, S. D.—The Chester Telephone Company has been incorporated with the following incorporators: Gus Fuhlendorf, Henry Bussell and Frank Grosbeck. The company will built a line from Armour to Platte.

CANOVA, S. D.—The Vermillion Telephone Company, with headquarters at Canova, has been incorporated with a capital stock of $500. The incorporators are W. T. Gough, C. W. Harter, Nels Graknberg and others.

WHITE LAKE, S. D.—An Independent telephone company has been formed at White Lake, S. D., with the following officers: President, J. H. Dunbar; vice-president, John Schlaeder; secretary, M. E. Williams; treasurer, Fred Steffen.

CHARLOTTE, TENN.—The Charlotte Telephone Company has been incorporated with a capital stock of $1,500.

GRANGER, WASH.—A Farmers Independent line has been organized at Granger. W. G. Hubbard is president, Barney Morrison vice-president, and Jerome Beard, secretary.

ETTRICK, WIS.—The Ettrick Telephone Company has been incorporated with a capital stock of $8,000. Incorporators: F. A. Knutson, H. O. Syvesson, A. J. Hodgen, H. C. Erickson and A. M. Hilleckson.

LOYAL, WIS.—The York Center Telephone Company has been incorporated with a capital stock of $1,000. Incorporators: W. J. Bush, C. H. Brown and H. H. Christofferson.

PERSONAL.

WINN BOSLOW, who has been connected with the construction department of the Interstate Telephone Company for the past six years, has accepted the position of manager of the construction department of the Streator Telephone Company at Streator, Ill.

RALPH D. CLEARWATER has been made district manager for Kingston, N. Y., by the Hudson River Telephone Company.

CHARLES H. COAR has resigned his position with the Northwestern Telephone Company to accept a position with the Twin City Telephone Company in its engineering department. Mr. Coar was recently appointed a member of the Minnesota State Board of Electrical Examiners by Governor Johnson.

EDWARD FOLEY has been promoted to the superintendency of the Hudson River Telephone Company's plant in the district including Troy, Watervliet, Cohoes, Waterford and Mechanicsville, with headquarters at Troy.

E. H. GREENLEAF, formerly at Kingston, N. Y., has been promoted to the management of the Newburg exchange of the Hudson River Telephone Company.

DUDLEY ROLLAND has been appointed manager for Linn and Benton Counties, Oregon, by the Pacific States Telephone Company.

P. L. LAVALLE has been made assistant manager of the Chicago Telephone Company's exchange at Geneva, Ill.

C. C. LEWIS has been transferred from Fremont to assume the management of the Central Union exchange at Delaware, O.

G. C. RIVELER has recently taken charge of the Port Huron exchange of the Michigan State Telephone Company.

C. E. ROWE, who has been manager of the Michigan State Telephone Company's exchange at Port Huron, has been made a special representative of the company with headquarters at Detroit.

MISCELLANEOUS.

INDIANAPOLIS, IND.—The Southern Indiana Railway will install a simplex telegraph and telephone line. It is said that the train dispatching will be done chiefly by the telephone.

MARINGOUIN, LA.—John M. Wilson will install a telephone system. Heretofore telephone communication with the outside was had through a single long distance box. Thirty subscribers, the necessary number for the establishment of an exchange, were secured within half an hour.

PROVIDENCE, R. I.—The New England Shaver Telephone Company has been reorganized under the name of the Heene Telephone Company, with a capital stock of $2,500,000. The company will construct and operate lines throughout the state in opposition to the Bell company.

EDMONDTON, ALBERTA, CAN.—The city is considering the installation of a municipal telephone system. For particulars address Mayor May or City Electrician Ormsby.

New Construction in the Field

LEWISTON, IDAHO.—The Lewiston-Waha Land & Irrigation Company is to build a private telephone line about thirty miles in length.

ALTON, ILL.—The Star Telephone Company, which has recently increased its capital stock from $5,000 to $25,000, is to make many important improvements in its system.

GREEN RIVER, ILL.—The Green River Telephone Company expects to make many improvements in its system.

HAGERSTOWN, IND.—Among other improvements to its system, the Cambridge City Telephone Company is to string about 2,000 feet of additional cable.

INDIANAPOLIS, IND.—The New Long Distance Telephone Company, of Indianapolis, Ind., is to build new lines to South Bend. It will also build trunk lines to Ft. Wayne, Louisville and Richmond.

NORTH LIBERTY, IA.—The North Liberty Telephone Company contemplates many improvements in its system.

LIVINGSTON, MICH.—The Livingston Mutual Telephone Company is building a line to Hartland, also to Parshallville.

MONETT, MO.—The Farmers' Mutual Telephone Company, now operating in the towns of Mt. Vernon, Aurora and Verona, is to build a line to Monett.

BEATRICE, NEB.—The Home Telephone Company is building a line to Wymore.

DEMING, N. M.—The Luna County Telephone Company is extending its lines from Deming to Faywood Hot Springs and to the Mimbres Hot Springs.

CALEDONIA, N. Y.—The Livingston County Telephone Company is installing an exchange at Caledonia.

CAMDEN, N. Y.—The Camden Home Telephone Company is building a line to Florence, also one to Hillsboro.

ITHACA, N. Y.—The Ithaca Telephone Company is to lay about 7,000 feet of conduit.

MARIETTA, O.—The Marietta Telephone Company is to spend about $50,000 in improving its system.

ALTOONA, PA.—The United Telephone & Telegraph Company, of Harrisburg, Pa., is to build a line from Altoona to Bedford.

CENTER MORELAND, PA.—The Commonwealth Telephone Company, with lines between Center Moreland and Lockville, is to extend its system.

LANDS' STORE, PA.—The Mountain Telephone Company is to build a line from Lands' Store to Fredericksville.

LOYALSOCK, PA.—The Loyalsock Telephone Company is to build lines to Lower Fairfield Township and to Proctor.

ST. MATTHEWS, S. C.—The Orangeburg & St. Matthews Telephone Company, which has recently increased its capital stock to $6,000, is to greatly improve its lines, and give St. Matthews an up-to-date local exchange.

ADAMSVILLE, TENN.—The Stantonville Telephone Company, of Stantonville, is building a line from Adamsville to Enville.

DALLAS, TEXAS.—The Southwestern Telephone & Telegraph Company is to spend $150,000 in conduit work.

DEXTER, TEXAS.—The Independent Telephone Company is building a line from Dexter to Hagerman.

SAN ANTONIO, TEXAS.—The San Antonio Telephone Company will string about 25 miles of aerial lines.

UNIONTOWN, WASH.—The Uniontown Telephone Company is to build a line to Johnson, where connections will be made with Pullman, Colfax and other towns.

WALLA WALLA, WASH.—The Ewartville Telephone Company, owned and operated by Colfax and Pullman citizens, is to build a line to Walla Walla.

Paint vs. Protection.
The life of the average pole is not over ten years. Painting does not increase this limit very much and quite frequently gives a false appearance of stability. If painted after it is set up the most needed point for pole protection is missed, the ground line. Here two distinct forces work for its destruction—the earth and the atmosphere. Poles creosoted by our process are protected not only here but throughout. Let us give you some figures which will show you how to save money.

THE GOULD PLATE

represents the highest development of storage battery invention.

It possesses far greater contact surface for active material, has higher watt-efficiency at all practical rates of discharge, and greater capacity per unit weight of active material than any other battery of the Plante type.

It will pay you well to study the records of recent Gould installations. Write for our bulletins.

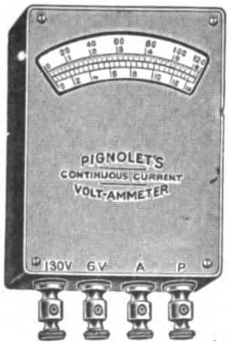
CHEAP VS. EFFICIENT SERVICE



The cheapest telephone service in the world is dear at any price if it is not efficient.

When a man installs a telephone he wants to be able to use it and not to abuse it.

A grounded line nine times out of ten is noisy, and foreign noise on a telephone line will arouse a feeling of anger in the heart of the user that isn't good for the company. You can keep your lines free from grounds and other troubles by periodic tests with a Pignolet voltmeter, and when they do occur, you can locate them with this instrument, and get them cleared often before the subscriber knew his line was in trouble.

If you need your subscribers' good will, you need my voltmeter to get it.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit

78 CORTLANDT ST., N. Y.

SIDE BRACKET.

TYPE A—10-Pair Hall Cable Box.

WHEN INSTALLING CABLE

one of the most important issues that will come up for your consideration is what type of terminal shall we employ. The Hall cable terminal embodies all the necessary qualifications which are required for protection and ease of distribution.

It is of particular value in multiple tap work, as any circuit can be readily isolated from the terminal leads for testing purposes. Being provided with a moisture proof, metallic covering, it is superior to the wooden box type. It can be easily inspected and, on account of the novel arrangement of the terminals, offers every opportunity for the ready change or transfer of circuits.

Hall terminals can be secured in sizes suitable for all purposes and are made for pole top or side bracket attachment. We would like to tell you more about them if you are interested. Write to-day.

NORTH'S Solid Back Transmitter combines ample volume, perfect articulation, deep penetration and natural pitch. It reproduces the voice high or low, loud or soft—a loud voice without breaking or blurring.

The full round volume is attained by entirely eliminating dampening springs; there is no unequal pressure on one side of the diaphragm, which is dish-shaped for confining its action to the path of the voice vibrations.

A small amount of polished granular carbon in a specially formed shallow cell eliminates packing.

All parts are made in jigs and tested accurately to a ten-thousandth part of an inch and there are no accidental transmitters in the product.

Just as a precaution, though, they are tested by an engineer before leaving the factory, under conditions approximating actual service.

CENTURY
100% GOOD

TO GIVE GOOD SERVICE,

it is necessary to have a switchboard that will give no trouble. One of the most essential parts of a good switchboard is a ringing and listening key.

We are illustrating the key used in our switchboards made by us. We have used the same type without any change for over five years. The first ones made are still giving perfect service.

All springs are made of German silver provided with platinum contacts. The insulation is of hard rubber.

This key will never give any trouble. Perfect contacts are assured at all times.

PERFECT PLUGS

are as necessary as good keys---our plugs are made to accurately fit jacks.

The different parts of the plug are assembled so that it is impossible for them to ever become loose. This prevents the breaks in the insulation, which cause short circuits.

The insulation is of the best quality of hard rubber.

The sleeve is held on by a knurled nut which can easily be removed.

We will be pleased to submit samples of our switchboard parts for your inspection, local or common batteries.

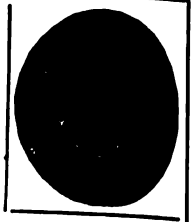
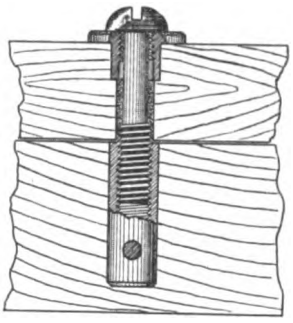
Little Things That Count



Unless otherwise ordered MONARCH TELEPHONES have a door fastening like that shown in the illustration. Two such fastenings are on each door. A machine screw passes through a bushing in the door and fastens in a slightly larger bushing in the box. The threaded portion of the screw being larger than the shank, the smaller bushing keeps the screw from falling out when loosened.



MONARCH TELEPHONE MFG. CO., - - - CHICAGO, U. S. A.

Cook No. 14 Protector

A Well-Known, Well-tried Protector, Wonderfully Improved

TWO HUNDRED AND TWENTY THOUSAND (220,000) of these same heat coils were installed during 1904 and 1905. They are giving perfect satisfaction.

The following exchanges have installed or ordered Cook No. 14 SINCE JANUARY 1, 1906:

Syracuse, N. Y.	6,100 pairs.
San Antonio, Tex.	3,300 "
Bloomington, Ill.	1,950 "
Paris, Ill.	1,380 "
Kansas City, Mo.	1,160 "
Canandaigua, N. Y.	1,000 "
Normal, Ill.	440 "

No bolts or pieces of wire used in transposing line and switchboard terminals (see diagram). No chance of loose connections in the circuit.

When the coil operates, a split spring tightly grips the tip, and prevents its falling into the lower banks of springs.

Lots of other good points that you want to know about. Write and ask. If you're interested, we'll give you a list of engineers and exchange managers who swear by this protector.

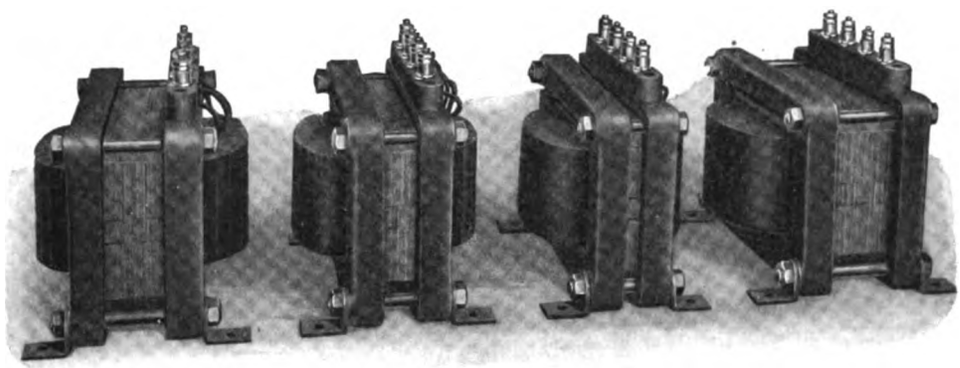
DEAN TELEPHONE APPARATUS

Unlimited Possibilities



The Harmonic Converter, together with our 4-party harmonic system, has opened up a new field in selective party line ringing which has unlimited possibilities—low first cost of ringing machines, switchboard selecting apparatus and selective ringing telephones—lowest possible cost to install—extremely low power cost to operate (lowest on record)—practically no maintenance expense—absolute and reliable results with non-interfering selective signalling.

The unlimited possibilities of the Harmonic Converter have recently given us the 8-party bridged selective system with no grounds, step by step mechanisms, biasing springs, vibrating contacts or other complications in the telephones or in the exchange apparatus. While this latter system is not ready for the market, we have proven it out in practice and exhibited it in actual operation before the American Institute of Electrical Engineers at Pittsburg, Pa., March 13, 1906.

The above illustration shows the four transformers used in our four frequency Harmonic Converter. They are built as massive and substantial as electric light and power transformers, and will stand untold abuse. Their ability to stand extremely heavy loads makes the Harmonic Converter an ideal ringing device. There is only one Harmonic Converter, that designed and built by us. It is not a delicate instrument or toy, being made for the largest and most exacting requirements.

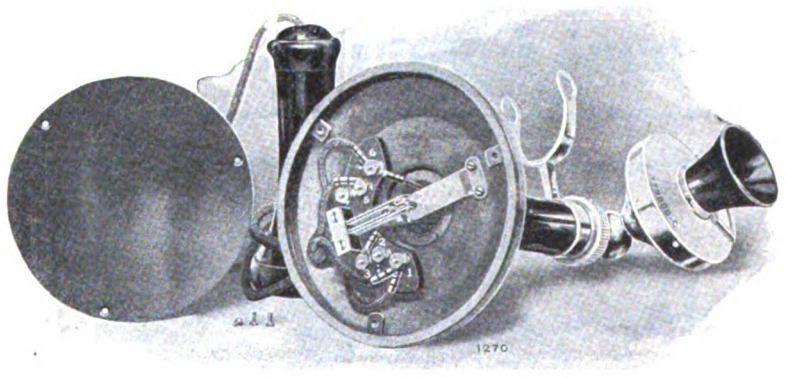
Ever Picture in Your Mind a Perfect Desk Telephone?

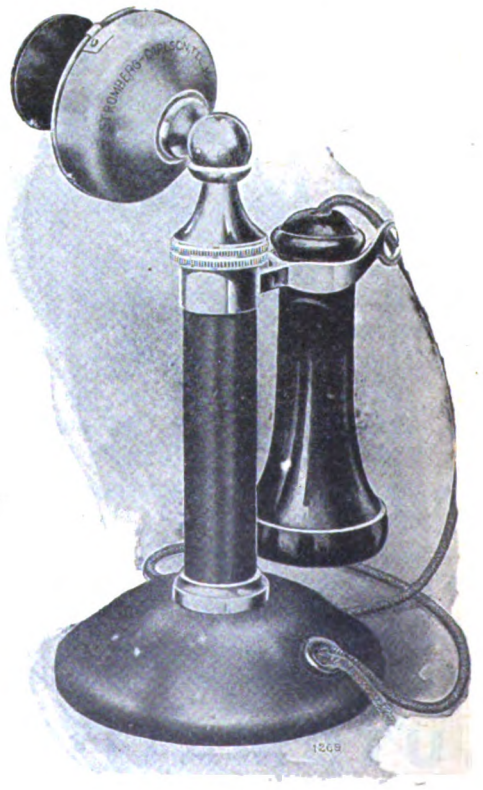
Most Telephone Men Have

Doesn't this one come the nearest to your ideal of any you ever saw before?

Could it be more attractive or simple? The finish will not show wear.

There is nothing about it to get out of order. No complicated parts.





Note arrangements of apparatus in base. The hookswitch is so simple and mounted so firmly that it couldn't get out of order.

The simplicity of that transmitter arm makes it attractive.

Better let us send you our Bulletin, describing this telephone more fully, and quote prices on your requirements.

Remember delays pay no dividends.

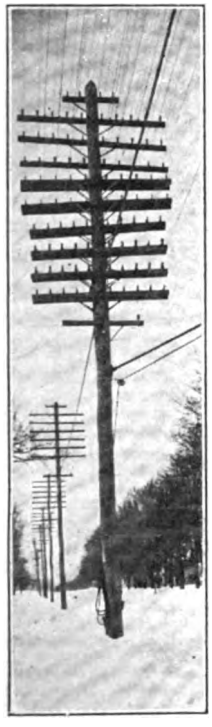
WE MAKE CABLE

Times Have Changed

IN the early days of telephony line construction was very much of a hit and miss proposition. There were no precedents to go by, and everyone built to suit his own convenience and pocketbook. Now it is different. Thanks to engineering skill and costly lessons taught by hard experience the matter of line construction has been thoroughly analyzed and definite rules have been formulated which if followed must bring success.

Past



Amongst other problems which have been solved is the one relative to cable, and now no practical up-to-date engineer would think of building heavy open-wire lines except for long-distance trunks.

Of the many advantages which cable possesses there are none greater than its factors of stability, freedom from trouble and low cost of maintenance.

March 10th we printed a letter from C. H. Judson, the well-known construction engineer. In it he gave his own experience, which emphasizes our statement that cable is the only form of construction that should be undertaken.

In the purchase of cable you should be governed by the proven ability of the manufacturer. We are

Present

COMPARE THAT WITH THIS

distributing "The Cable Booklet," which adequately describes and illustrates every process in the manufacture of Stromberg-Carlson Cable. It takes you through all departments from the receipt of the raw material to the shipping of the product and gives an excellent idea of the care and attention that is given to every detail which all go to make Stromberg-Carlson Cable standard. Will be pleased to send it to you and quote you prices. Ask for Booklet No. 79-B.

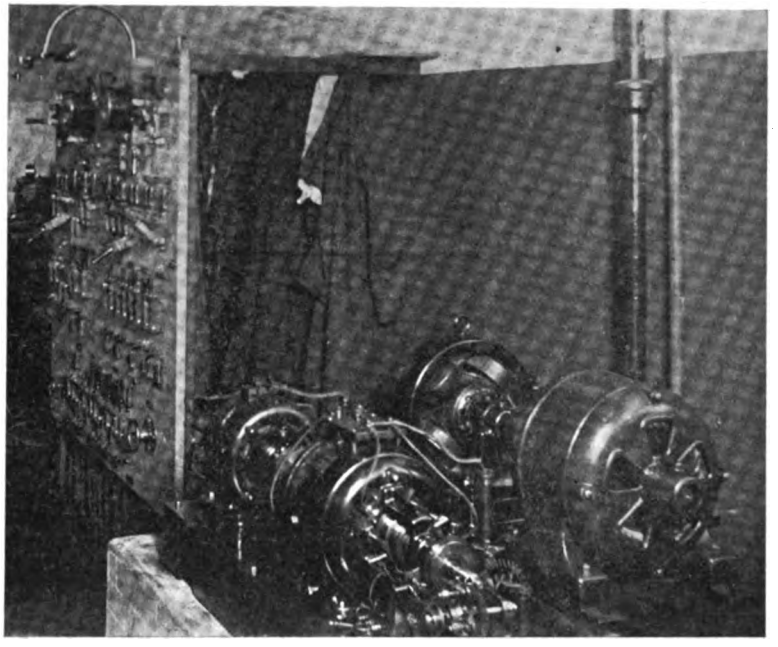
Power Data for Telephone Men*

By P. Kerr Higgins.

In order that a sufficient understanding may be obtained of the problems arising in motor work it is necessary to review briefly magnetism and electro magnetic effects. One of the essential points to be observed is that iron when acted upon, if soft, does not retain its magnetism, while steel will retain its magnetism and becomes what is known as a permanent magnet. Two poles are recognized, north and south, and are governed by the following rule: "Like poles repel, unlike poles attract each other." If a magnet is broken each piece will be a magnet and possess all of its characteristics. Another rule which applies to magnetic effects is that "Lines of force tend to set themselves parallel to each other," hence the magnetic or compass needle will always set itself so that its own lines of force will be parallel to those of the earth.

The magnetic field is the space in which the magnet has the power to affect soft iron bodies; to observe direction of magnetic field use iron filings on a sheet of paper with magnet below the paper. A piece of iron brought into the magnetic field of a strong magnet partakes of the characteristics of the magnet while under its influence. If hard it will retain them, if soft it will not. This will explain the law of attraction.



Power Switchboard and Charging Machines in the Independent Exchange at Columbus, Ga.

To obtain the full effect of both poles on another object, the magnet may be bent in the form of a horseshoe, or one set of opposite poles may be braced together, leaving the other set free for work. If such a magnet is not required at once, a keeper of soft iron should be attached to the free poles, otherwise the poles will neutralize each other and weaken the magnet. The magnet with the keeper across the poles forms what is termed a closed magnetic circuit, which is frequently used in telephony in the repeating coil, by extending and overlapping the soft iron wires of the core, so that they are always in contact. When magnetized by the passage of a current through the coil, a closed magnetic field in the core is the result and increases the efficiency of the coil.

A dynamo is a generator of electricity by artificial means, that is, by the application of power from some mechanical source it is possible to transform such power into electricity. This is not done, however, without a certain amount of loss, varying according to the style and design of the dynamo.

It is now customary to wind the armature with separate coils for each segment pair of the commutator, the end of one coil connecting with the beginning end of the next at the segment. Disks are now used instead of iron wire for the armature core, which is built up of a series of plates in order to kill the eddy currents which circulate in the armature and are a source of loss through retardation, heat, etc. This loss is termed "hysteresis."

A uniform magnetic field is absolutely necessary so as to exert a uniform pull at every point in the field of force, and this fact is constantly kept in view by designers. A distorted field will cause leakage and a consequent loss in energy, and inasmuch as the dynamo is to produce energy and this can only be done by a uniform variation of the number of lines of force cut by the armature windings, it will be seen at a glance how necessary this feature is in its design. The shape of the iron is also important and must be uniform throughout with no abrupt corners. The space also between the armature and the field must be carefully considered. This is called the gap, and should be as small as possible. In the determining of the amount of heat lost in a dynamo, it is known that heavy or large wire of great length will cause the generation of the same amount of heat as a short fine wire. The amount of heat generated is proportional to the product of the square of the current, the resistance and the time. The power consumed in watts is equal to the square of the current multiplied by the resistance. A watt is 1-746th of a horse power. The unit of electrical power is the watt and represents the power expended in an electric circuit when a current of one ampere passes through a resistance of one ohm or when the difference of potential of one volt is maintained between the terminals of a circuit having a resistance of one ohm. In an electric light circuit so far as the power is concerned, it is immaterial whether each lamp requires 110 volts and half an ampere, or 55 volts and one

*Continued from the issue of Feb. 10th.

Digitized by Google

ampere, or 220 volts and one-fourth ampere, the result in watts is the same, as can readily be seen by a reference to the rule already given.

In the design of the commutator or collector portion of the dynamo, the current at the contact surface of the brushes must be limited to prevent undue heating. Two features should be considered, these being the minimum waste in watts due to brush defects and never to render possible undue heating of the brushes. If too high a current density exists in the brushes then heating of the brushes will be the result, even though the armature may be perfectly cool, hence a safe limit is 33.3 amperes with a maximum of 55 amperes, beyond which there is danger of loss. By using special contact brushes these figures may be increased. The losses at the brushes are usually due to two causes: friction and contact loss. The temperature usually specified is 90 de-

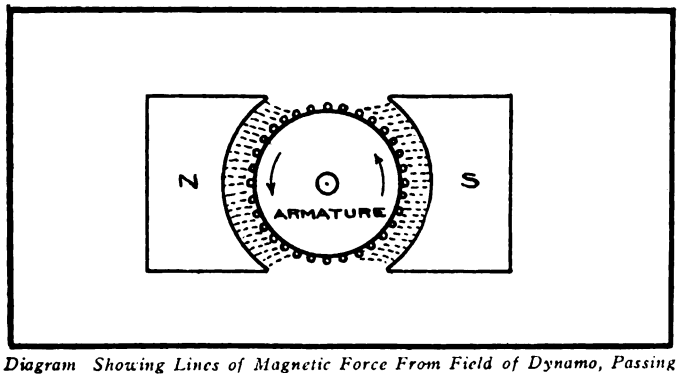


Diagram Showing Lines of Magnetic Force From Field of Dynamo, Passing Through the Armature.

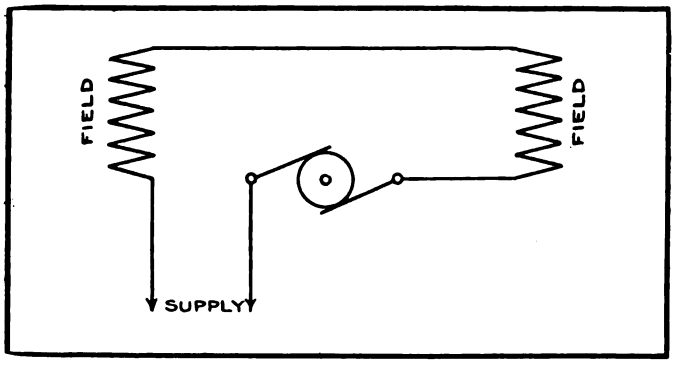
grees Fahrenheit above that of the surrounding air. The best insulation for a commutator is soft mica or asbestos, both of which are not easily destroyed by heat. The waste usually permissible is two watts per square inch at a speed of 2,000 feet per minute.

The number of coils to be used is limited by the number we can get into our commutator. The pitch of the commutator bars is often set at 4-16ths inch for small machines and 5-16ths for the larger ones. Soft mica is used for insulation between the bars, as the wear of the copper and mica are nearly uniform. Otherwise the copper would wear more rapidly and the projecting ridges of mica would cause sparking. The commutator is insulated from the main shaft by mica. On account of blow holes in cast copper, rolled copper is very much to be preferred for the bars. The loss in field windings (C^2R) of shunt and series wound dynamos varies from 4.5 per cent. in a 5 kilo watt to 1.5 in a 60 kilo watt dynamo.

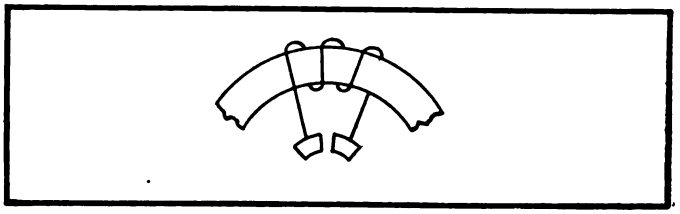
Dynamos are usually used for small electric light installations or for charging accumulators. The usual types are of three classes of construction, series, shunt wound and compound wound.

As the voltage of a dynamo at the brushes is equal to that generated less that taken up in heating the armature wires, the drop in these wires is important. An increase in current consumed means an increase in drop. The drop of a dynamo is also affected by a counter E. M. F., which



Connections Through Field and Armature of Two Pole Series Dynamo.

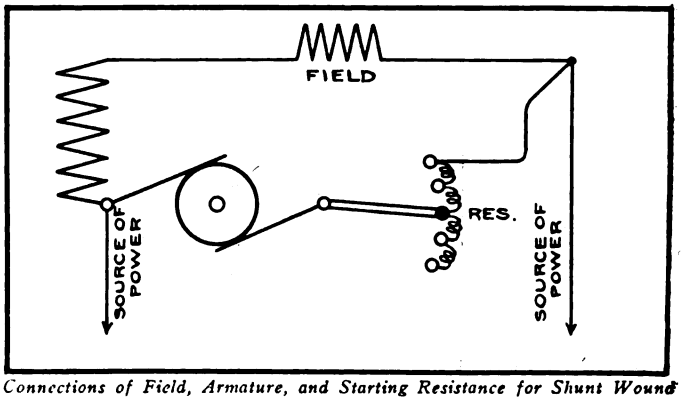
becomes stronger as the current is increased. The regulation of the field resistance compensates in some measure for this loss, but necessitates personal and constant attendance, hence the need for some automatic regulator which is found in the compound wound dynamo, being so constructed that when the two losses in



Connection of Single Armature Winding to Commutator.

the armature take place, the dynamo automatically varies the resistance in the field by sending the main current through the field coils so that as the current increases or diminishes it causes a corresponding variation in the strength of the field. Hence the dynamo will produce more voltage only when the armature produces more current. Both the shunt wound and the compound wound dynamos are used for direct current work.

A motor dynamo is the combination of a motor and a generator, electrically separate but mechanically connected by a flexible coupling and may be wound either shunt, series or compound as desired. The generator may be designed for either direct or alternating current. In telephone work the motor is usually wound for 500, 220 or 110 volts, according to the source of supply. For charging purposes the generator should give a voltage slightly above that of the battery with which it is to be used. For charging batteries direct current is necessary, for signalling ringing telephone subscribers, etc., alternating current is used. The lubrication should be by means of oil rings (automatic) and requiring attention not more than once a month. The brushes on all generators furnishing a current of low voltage and high amperage should be made of copper gauze; carbon brushes of suitable size may be used on others.



Connections of Field, Armature, and Starting Resistance for Shunt Wound Motor.

The electric motor is used for transforming electric energy into motive power for running other machinery. Like all power machines, it should be simple in construction, compact, well protected from external injury, automatic in speed regulation, durable, easily repaired, of high efficiency, free from sparking, light weight, etc.

The rule for finding the circular mils of the wire used in the coils is

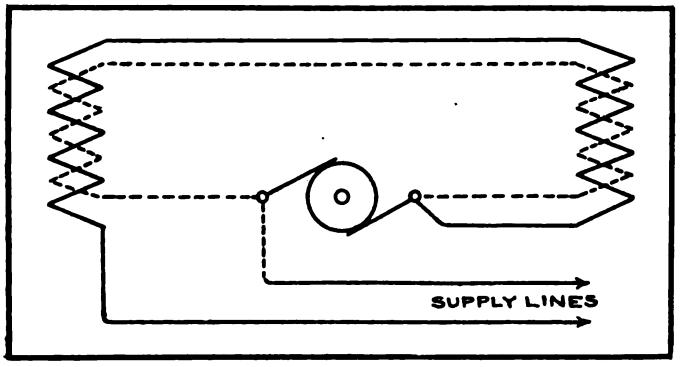
$$\frac{\text{Total ampere turns} \times \text{mean length of turn.}}{1.106 \times \text{volts of coil.}}$$

An allowance of approximately 1,000 circular mils per ampere equals a current of .320 ampere for a wire, say 310 circular mils, and the amperes divided into the ampere turns will give the length in feet × length of one turn. The series motor is generally used on constant current ,constant potential circuits, such as arc lights and street railway systems; the shunt form is used on stationary work as in factories, telephone exchanges, etc.

The series wound motor is so designed that the same current is used in the field as in the armature. The current passing through the motor is equal to voltage of line—back voltage ÷ resistance in ohms of both field and armature. These motors are much in use on street cars on 500 volt systems, and their regulation is car-

Digitized by Google

ried in by a controller in the hands of the motorman. A series motor increases its speed as its load is reduced and diminishes as the load is increased, hence manipulation of the field is necesary.



Arrangement of Windings for Compound Machine, One Field Winding in Shunt and the Other in Series With the Armature.

The shunt wound motor is something similar to its namesake, the shunt wound dynamo, hence the speed of the motor is fairly uniform under varying changes in load. The back E. M. F. is the regulator of the amount of current taken by the motor, hence the increase or decrease in the load has a similar effect on the speed of the motor. The speed is a very important thing to be considered in the design of a motor. Speed is largely a question of the relationship existing between the load, the strength of the field and the impressed voltage, hence changes or variations in these change the speed, and the motor must be designed for one or other of the two factors already mentioned. The parts of a motor entering into a question of speed are the armature and the field, and these are interdependent upon the current in each and all problems of speed are solved by a consideration of these factors. Automatic control is, of course, preferable when a constant speed is desired and resistance when a variable load is considered.

In starting a motor a rheostat is usually employed to regulate the supply of current, and in shunt motors great care should be taken to allow a short interval to elapse before the resistance is all cut out. This is necessary to allow the generation of what is known as back E. M. F., which acts as a brake, and the resistance should not be cut out even gradually until a fair speed has been established. On account of the very low resistance of the armature this precaution cannot be made too prominent, the amperage going through the machine being represented by the voltage ÷ the resistance, which in nearly every case would destroy the armature completely were the resistance not cut out very carefully. It is to be noted that high efficiency motors are in the end much more economical than those having low efficiency, in that while the prime cost is greater, the waste in energy is greatly reduced. It is poor economy to overload motors or for that matter any form of machines or accumulators for the reason that such overloading increases the depreciation of the apparatus frequently as high as 50 per cent., hence the rating of the manufacturers should be strictly adhered to.

Of late the use of circuit breakers has become general among telephone companies, and they are present on every well designed power board. They are intended to cut off the supply of current when for any reason it is over or under the proper load. The apparatus consists essentially of an electro magnet having a movable core end capable of adjustment to be attracted when a certain current passes through a surrounding helix. The contact points are of carbon, which renders the break arcless. The action is instantaneous.

All power boards are supplied with measuring instruments such as volt and ammeters, by means of which we can know the conditions existing in the circuit, from which data we can know the amount of electrical power consumed by the apparatus.

The electrical horse power is equal to the number of

$$\frac{\text{amperes} \times \text{volts}}{746}$$

Commercial efficiency can be found by dividing the horse power put in by the horse power taken out.

(To be continued.)

Telephone Engineering*

By J. J. Carty.

FROM time to time, engineering methods involving new principles are brought forth. These, when found to affect the methods of the business office, should be submitted to the business management with a full and clear statement of their bearings upon the commercial work of the company. On the other hand there are, from time to time, business proposals and commercial methods which are under consideration by the business management of telephone companies and which, apparently, are only remotely or not at all related to engineering. In view of the many unexpected and important reactions which these proposals may have upon the engineering of the telephone plant, it becomes of the first importance that they should be scrutinized carefully from an engineering point of view, unless it is conclusively apparent that they will be without effect upon the engineers' plans.

During the ten years just passed a revolution has taken place in the design and construction of telephone switchboards, the magneto switchboard having given way to the common battery switchboard. This radical change in telephone practice made new demands upon the telephone engineer, for it became necessary for him to introduce into central office construction certain elements which had heretofore been utilized principally in engineering work involving electric light and power installations.

In the magneto system, signaling from the subscriber's station to the central office was accomplished by means of a small alternating current generator turned by hand, and the current supply needed in the working of the transmitter was obtained from a few cells of primary battery located at the subscriber's station. By the introduction of the common battery system all of this was changed. The magneto generator was dispensed with as was the primary battery, the current supply for operating the transmitter, as well as that required to enable the subscriber to signal, being drawn from a large storage battery located at the central office.

In the case of a 10,000 line switchboard, the storage battery must be capable of giving an average discharge of 500 amperes; and to insure proper working conditions, it must be capable of giving a safe discharge as high as 2,000 amperes. For charging such a battery as this, suitable machines must be employed, and these must be present in duplicate or triplicate. The standard machine used for charging a battery of this type delivers 1,000 amperes.

The introduction of currents such as these, and the introduction of these machines and of a large number of auxiliary machines generating currents for special purposes, has resulted in the creation of a power plant at each central office, upon which the operation of the telephone switchboard and apparatus is wholly dependent. The introduction of these larger currents has necessitated most careful and refined methods of fusing and protecting the delicate apparatus.

While the storage batteries and auxiliary machinery employed in telephone power plants are far from equalling the magnitude of similar apparatus employed in electric light and power stations, nevertheless they have become such a vital element of the successful engineering of a telephone central office, that they require on the part of the telephone engineer a special knowledge of this branch of electrical engineering, which was formerly not requisite.

*Continued abstract from paper read before the American Institute of Electrical Engineers, Feb. 23, 1906.

Digitized by Google

This class of apparatus must also be considered by the telephone engineer in a special manner, for not only must it be properly constructed from the electric light and power point of view, but peculiar conditions must be provided for on account of the association of this apparatus with such a delicate instrument as the telephone.

Where a dynamo is to be constructed to operate incandescent lamps, let us say, certain minute fluctuations in the potential of the machine are permissible. Were such a machine, however, to be used in connection with telephone circuits, these fluctuations in potential would be sufficient to produce such constant humming in the telephone as to render it inoperative. Hence a greater refinement of the construction of these machines in this respect is imperative where they are employed in the telephone power plant.

So it is with the storage battery, where a number of telephones are supplied by current from one storage battery; even almost infinitesimal changes in the voltage of the battery might be propagated to the telephone lines connected therewith and produce disturbances. For this reason, storage battery practice from the telephone point of view presents problems which are different from those encountered elsewhere.

One of the interesting and important developments in the modern common battery switchboards is the extensive use which has been made of incandescent lamps in signaling. The requirements of the telephone art have called for special refinement in the design and manufacture of these lamps.

While the common battery switchboards as now used in all of the large central offices represent a revolution in methods as compared with the magneto system, there are certain elements formerly used in the magneto system which have persisted. Among these is the multiple board principle. This principle consists in extending a number of lines to different points in the switchboard so that it is possible to connect with them at any one of these points. The multiple system is opposed to the transfer system, which is one wherein the lines are not so extended or multipled to different points, but proceed directly to a special location from which trunk lines extend to other parts of the switchboard, so as to provide for making the necessary connections. It is safe to say that during the past twenty years there has been no question of switchboard design that has been the occasion of so much discussion and controversy as that pertaining to the extent to which the multiple principle should be adopted.

In a self contained central office, with relatively few trunk lines extending to other offices, it is found most economical to multiple all of the subscribers' lines to each section of switchboard. In very large cities where a number of central offices are required and where the amount of trunking between the different central offices is relatively large, the advantage of multipling all of the subscribers' lines to each section is not so apparent as in the case of the self-contained office, and this fact has led many to the conclusion that for such situations multiple boards are not adapted. But this is going farther than the fact warrants, for while it is true that the advantage of multipling the subscribers' lines to all of the sections of the switchboard becomes less and less as the percentage of trunking increases, it is still a fact that the point is never reached where the multiple principle should be abandoned entirely.

The truth of this proposition may be easily established by assuming that in a large city all of the calls must be trunked and that none of them are local to the office in which they originate. In such a case as this it is obvious that nothing could be gained by extending all of the subscribers' lines before each of the operators. On the other hand, it is still essential that the outgoing trunk lines should be extended, or multipled, before all of the subscribers' operators, and all of the subscribers' lines should be multipled before the trunk operators. While the case of an office without any local calls is one which could not occur in practice, there are situations in which the amount of local calls is so small that it will not pay to multiple the subscribers' lines to all of the subscribers' operators. Just when this point is reached is a question to be determined in each case.

All materials which are permitted to form a part of the telephone plant must be carefully studied by the telephone engineer, so as to obtain, out of all those possible to use, those which offer the best combination of first cost, durability, low annual charges and high efficiency.

Considering the almost innumerable varieties of materials used, all of which must be covered by standard specifications, the work of this branch of telephone engineering, taken by itself, would require so much time to describe that I will not attempt to enter into it in any detail, except to say that it constitutes one of the important duties of the telephone engineer.

Intimately connected with this matter of the choice of material and making the specifications therefor is the complementary function of accepting or rejecting that which is offered. The drawing up of the specifications must be attended to with the utmost care so that they may be placed in the hands of the purchasing agent, and be sufficiently intelligible so that any manufacturer or person skilled in the art can understand their purpose without further information. Not only must the article desired be clearly described, but the language used must be such that no material other than that desired can be furnished. While every precaution must be adopted in the specification to exclude undesirable material, great care must be exercised that undue and excessive requirements should not be specified. Otherwise the cost of the materials would be unnecessarily increased. Here, as well as at almost every turn in the work of the telephone engineer, there is no safe side. If the specification is made too rigorous, and calls for material of a quality in excess of that which is demanded by the nature of the construction, loss will result. On the other hand, if the specification is drawn loosely or so as to admit inferior material, loss will result owing to defective working of the construction in which such materials would enter.

So far as I have gone, I have described the more typical functions of the telephone engineer. In addition to this, there are constantly arising questions demanding special investigation. The range of these questions is almost unlimited, and their adequate treatment requires most laborious and serious effort on the part of the telephone engineer. While their range is so extended as to cover almost every field of engineering in scientific progress, and while the telephone engineer cannot be expected to be expert in all departments of scientific investigation, he is required to direct such investigations, employing, as his judgment may dictate, experts in various departments to report upon those phases of the work in regard to which they may be best qualified to speak.

Thus far I have discussed the work of the telephone engineer without particularly calling attention to his relations to the telephone organization at large. This relation can best be understood by stating that the telephone engineer in every well organized telephone company must, in the first place, broadly determine all of the important features of the plant of the company, and he must in detail decide what shall be the nature of the construction and the method of operation of every single item which constitutes the physical property of the telephone company. If, through defective design, a telephone cable is found to be ineffective mechanically or electrically, it may be said in a properly organized telephone company that the fault lies with the telephone engineer. If, through defective design, the telephone switchboard is found to be unsuitable with respect to its maintenance or operation, the fault lies with the telephone engineer. So on through all of a multitude of items which constitute a telephone system. If, in a well organized and well administered telephone company, the plant is not constructed in accordance with the best state of the art, the fault lies with the telephone engineer.

NEW COMPANY FORMED TO TAKE OVER PLANTS IN KENTUCKY AND INDIANA.

SEVERAL of the more important plants in Kentucky and Indiana are to be merged in a new concern to be known as the Central Home Telephone Company. The capitalization of this company, which was organized under the laws of the State of New Jersey, is placed at $5,000,000.

Among the companies already taken over are those operating in Owensboro, Paducah and Maysville, Ky., and Bedford and Bloomington, Ind. At present the Central Home Company purposes to

Digitized by Google

buy out from fifteen to twenty Independent companies, and with these as a nucleus to extend its operations as quickly as possible. The long distance lines will be operated in conjunction with those of the Louisville Home Company and the New Long Distance Telephone Company. The officers of the company are E. L. Barber, Wauseon, Ohio, president; Joshua D. Powers, Louisville, treasurer, and J. L. Monteith, Bloomington, Ind., secretary.

Among the Louisville capitalists associated in the company are Samuel Culbertson, James P. Helm, who is also attorney for the company; John L. Helm, Attilla Cox, J. Will Gaulbert, George Braden, Harry Weissinger, Henry Kaufman, Powhatan Wooldridge, J. B. Lewman, John J. McHenry, John Armstrong and about twenty others. A meeting of the underwriters of the company will be held in Louisville in the near future, at which time a board of directors will be elected. The general offices of the company will be in the Louisville Home Telephone building.

Canvassing for Subscribers

By R. S. Hamilton.

UNTIL within the last three or four years the importance of the solicitor was very much underrated. Inexperienced men were employed with no thought as to their qualifications, and the results of such mistakes are even at this late date appearing in some of our exchanges where uniform rates are desired. Previous to this time a particularly influential man was given a fifty and sometimes a hundred per cent. concession until there would perhaps be a dozen different rates for the same class of business. Only last fall an Independent company in one of our western states employed two solicitors in a city of 35,000 population, and told them the different rates and greatest consessions they would be allowed to offer to those especially desired. Now this company is making no end of unpleasant explanations and extremely expensive arguments with both old and new subscribers. Not only this, but the men were allowed to jump here and there in their canvass until it was impossible for any one to tell when the city had been covered, and in this way good prospects were overlooked and the same territory often covered the second time. On asking the general manager how he handled his solicitors he said:

"We leave the details entirely in their hands; the results are all we are after. I am too busy with other matters to give it my attention."

That general manager does not realize, seemingly, that those solicitors are laying the foundation for future dividends or for discord and loss of business. The most serious mistake we Independents are making to-day is in cutting of rates during an active canvass or fight. If a concession must be made the rates should not be cut, but free service may be given for a certain length of time, and at its expiration the old rate may be restored. Having once lowered the rate many of us know from experience how difficult it is to replace it, while with the temporary free service people expect no change in the rate when it is resumed.

There is no plan of canvassing that will apply indiscriminately as the conditions vary so widely in different sections. The general plan may well be left to the contract agent if the number of solicitors will justify the employment of one. The superintendent of a company with 500 subscribers in a rapidly growing city of 12,000 in one of our central states, remarked recently that he did not see the necessity of employing solicitors as they were receiving on an average of 25 contracts a month. Now supposing his rates to be $2 for business and $1.50 for residence, dividing the 25 as 8 business and 17 residence, a fair average, his gross earnings on the increase would be about $3,046 for a year. One good solicitor can secure 150 subscribers in three months, which will show $4,482 for the same time, a gain of $1,436. This man did not see that with the aid of a good solicitor he would be receiving revenue from future subscribers this month instead of several months later. We are taking it for granted, of course, that he is in shape to take care of the increase. There are cross-arms filled with "dead" circuits in good territory in many of our thriving cities to-day that ought to be helping our gross earning column materially.

In selecting solicitors the character of those who are going to represent our interests in the homes and business places ought to be taken into consideration, and care should be taken to employ only such as can command the respect and attention of the best business men in the city. No man should be started out until he is thoroughly familiar with the conditions of both his company and the opposition. If his company has irregular rates, if one of his present subscribers is receiving a certain class of service at a less rate than he can offer it, he should be able to give a satisfactory reason to those with whom he hopes to do business. It ought never to be necessary for him to say to a prospective subscriber "I will see what I can do for you," for the party is then under the impression that there are special favors possible. We are fast learning that the same rate to all will pay in the long run, however much we are influenced to vary now and then for what we consider "policy's sake."

It is a hopeful sign to note that there is an unusual demand for first-class solicitors at the present time, and recent results are particularly encouraging in that they show the advantages derived from a systematic management of trained men by the contract agent as well as the co-operation with them of all interested. The information gathered by them in their daily rounds has been found to be very valuable in assisting the operating department with the needs of their subscribers and the construction department in the matter of future development.

PHYSICIANS OF PENNSYLVANIA TOWNS THROW OUT BELL TELEPHONES.

AN interesting example of the manner in which the Bell companies lose the confidence of the public by giving deceptive rate concessions as a means of injuring a competing company, has recently come to light in Pennsylvania. The facts in the case are these:

Physicians in Pittston and West Pittston had been receiving very poor treatment from the local Bell company, their principal grievance being extortionate rates. Attempts on the part of the medical fraternity as a whole to have the trouble adjusted were met by the Bell with a minimum rate of $2 per month with such limited service and restrictions as would render a contract under these conditions valueless, the evident intention being to force a much higher rate.

A meeting of the physicians was held, at which the local manager of the Bell Company was present. During the discussion he stated that the increase in rates was not to the medical profession alone, but that the company intended to gradually discontinue the old contracts, as they were made at a rate which was only given as a fighting measure to displace the Independent system. When the physicians offered to give to the Bell a rate similar to the one they were paying the Independent company, they were informed that the Bell felt it could now raise its rates without losing any subscribers.

The statement was also made that the Independent company would be unable to extend or better its service, which is in line with the usual Bell policy of endeavoring to belittle the service furnished by its opponents.

Evidently the Bell manager had been badly misinformed, for the Consolidated Telephone Companies, the Independent concern in question, had already contracted for new equipment to be installed within the next sixty days, and furthermore instead of being on the wane it is rapidly increasing its list of subscribers. It already has practically as many telephones as the Bell in the

Digitized by Google

same territory. The upshot of the meeting was that the physicians voted, as a body, to discontinue the use of the Bell system, and are at present using the Independent service exclusively.

As a result of an investigation conducted by the doctors of Pittston and vicinity, it is stated that of the 800 subscribers claimed by the Bell, there are a large number that have instruments in their residence and place of business as well which materially reduces the list of individual subscribers. Taking this statement in conjunction with the fact that a major portion of the Bell subscribers use the Independent service as well, there are but a few who rely upon Bell service exclusively. As the physicians are in a position to observe the relative merits of the service under the two systems, and furthermore are absolutely obliged to use the most complete and efficient service, their decision in this case would seem to be an unavoidable proof of the superiority of the Independent system.

OFFICIAL BULLETIN NUMBER NINE OF THE NATIONAL-INTERSTATE TELEPHONE ASSOCIATION.

MAPS:

Since Bulletin No. 8 was issued a toll line map of West Virginia has been commenced. This makes fourteen State Maps, all told, on which we are working at present. The map of Ohio is practically completed and will be printed in connection with the latest Independent statistics of the State for distribution at a nominal price on or about May 10th. All Ohio companies who have not furnished data for their systems are urged to do so without delay, so that their lines may be included in the map when published.

We want data from other States, too. Send us that map of your lines at once! Don't wait for a personal letter.

COMMITTEES:

The committees announced last month have taken up their work and would like to hear from practical Independent men regarding the subjects to be considered. Every one connected with the Independent movement is interested in the work of these committees, and there are many who are peculiarly qualified to assist them. Now is the time to give your associates in the telephone field the benefits of your ideas or experience. Address your communications to the chairman of the proper committee in care of this office. The committees are those on Standard Forms of Accounting, Standardization of Equipment, Standard Operating Rules and Regulations.

CONVENTION:

The Annual Convention this year will be held in Chicago, at the Auditorium Hotel, on June 26, 27 and 28. The change in place to Chicago from St. Louis, as previously announced, was authorized by the Executive Committee at the request of many prominent telephone men, in view of the fact that the Kinloch Telephone Company of St. Louis will be cutting over to its new switchboard at the time of the convention, and requests that the association meet in St. Louis next year, when it will be in a position to properly entertain them.

NEW ASSOCIATIONS:

We take pleasure in welcoming the State organization into the Independent field. The Arkansas Independent Telephone Association was organized at Little Rock on February 11. Mr. Eugene Hale, Ozark, is president; Mr. John B. King, Texarkana, secretary. A complete list of officers and report of proceedings have already been published in the journals. Success to the latest arrival!

FINANCIAL:

Independent telephone securities are regarded as more substantial and occupy a higher place in the investment world to-day than at any time in their history. Large amounts are now being sold in the markets of the country on a five and six per cent. basis. Reports received indicate that more new money will be spent this year by Independent companies than in any one year in the past. A great deal of this will be used in taking care of new development by making extensive additions to existing plants and extending toll lines into undeveloped territory. A large amount, however, is being spent on new properties in building up the few remaining cities where Independent exchanges have not been installed. That the value of Independent securities is being generally recognized is attested by the fact that some of the largest financial interests of the country are investing heavily in these securities and consider them as safe and profitable as the securities of other public serving corporations. The preference shown by the citizens of various places for Independent service does much to increase the favor with which Independent securities are being regarded by investors.

TELEPHONE PUBLICITY:

The telephone situation is being ably presented to the reading public of the country in a series of articles, "Fighting the Telephone Trust," by Paul Latzke, which are being published in the Success Magazine. The first and second of these have already appeared in the February and March numbers. Jesse W. Weik has also written an able article entitled "The Telephone Situation," which appeared in the Atlantic Monthly for February and has been reviewed in the Review of Reviews for March.

SUPPLY DEPARTMENT: The "Shield."

We are glad to note an increased demand for the standard toll sign. This sign is, in fact, the banner of Independent telephony and all Independent companies should take pride in displaying it at their exchanges and pay stations. Show the people where you stand and help educate them to "Look for the Shield."

Illustrated catalogue for the asking.

The popularity of the gold-plated "shield" buttons continues. Are you wearing one? Samples 35c.

OBITUARY:

Mr. P. T. Spencer, secretary of the California Independent Telephone Association, died February 12. We extend our sympathy to his family and friends and his fellow members of the California Association. They have sustained a severe loss in the death of so true a friend and so able an officer. Mr. Spencer was one of the delegates from California to the National-Interstate Convention last year and took an active interest in everything pertaining to the welfare of Independent telephony. His death at this time is to be deeply regretted.

QUERIES

SHUNTING EFFECT ON PARTY LINE.—(673.)

Each bridging telephone with a 1,600-ohm ringer on a party line detracts what per cent. from the talking circuit:

1. With receivers up?
2. With receivers down? J. D. J.

1. One 1,600 ohm ringer set, bridged, with the telephone on the hook has no very noticeable effect on talking current. As nearly as can be determined by laboratory tests the reduction in transmission is about 3 or 4 per cent. That is, each bell reduces transmission from what it was by about 4 per cent. With 10 bells bridged therefore the transmission will be .96x.96x.96x.96x.96x.96 x.96x.96x.96x.96, or 67 per cent. of what it is with no bells. This is roughly equivalent to the addition of 100 miles of No. 12 copper circuit.

2. The reduction of transmission with the telephone off the hook depends on the type, or the impedance of the receiver and induction coil. With a 65 ohm receiver and 180 ohm induction coil such as are used by the Bell companies the reduction is in the neighborhood of 15 per cent. It is somewhat greater with the bridged set nearer the receiving end than if it is near the transmitting end.

CHARGING STORAGE BATTERIES IN EMERGENCY.—(674.)

Will you kindly let me know if there is any method of charging a 24-volt battery, type E. T. Chloride Accumulator, from a 500-volt circuit, in case of a breakdown of the regular charging generator? R. L.

The batteries may readily be charged from the 500 volt circuit provided that a proper resistance is inserted in series with the batteries to be charged.

One practical form of resistance is a bank of incandescent lamps, connected in sets as shown in the accompanying diagram, Fig. 674a. For charging 11 cells, type E. T., the resistance should be adjusted to make the current in the charging circuit approximately equal to 4½ amperes, which is the normal charging rate for these cells. This result may be secured by the use of four parallel sets of 32 c. p. 110 volt lamps, each set containing five lamps in series, or with eight parallel sets of 16 c. p. 110 volt

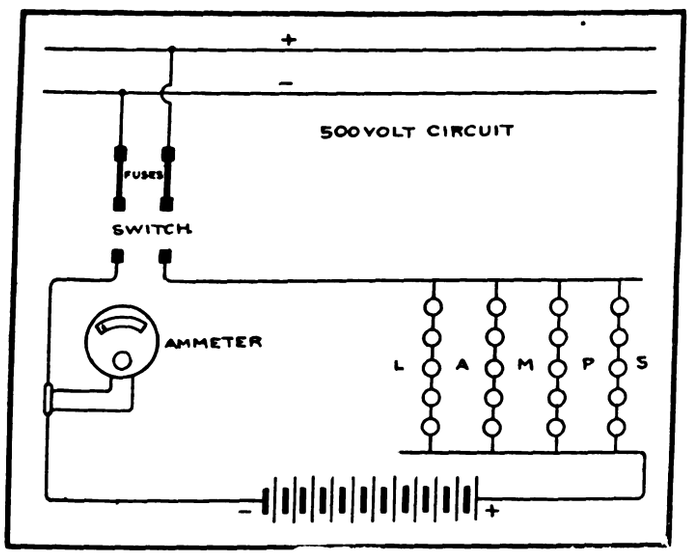

Fig 674a.

lamps, each set containing 5 lamps in series, or the equivalent of these combinations.

If lamps are not available a water rheostat may be quickly set up, and used as a substitute. This consists in one form of a non-metallic tank, containing a weak sulphuric acid or saline solution, in which are immersed two metallic plates, which serve as terminals of leads in the charging circuit. The plates are suspended in such a way that the distance between them can be altered, thus varying the resistance and consequently the amount of current passing through the batteries.

Another less satisfactory method of constructing this apparatus, which, however, is illustrated in Fig. 674b, consists in the use of a metallic pail, which is set upon an insulating support and forms one terminal of the circuit, the other terminal being a metallic

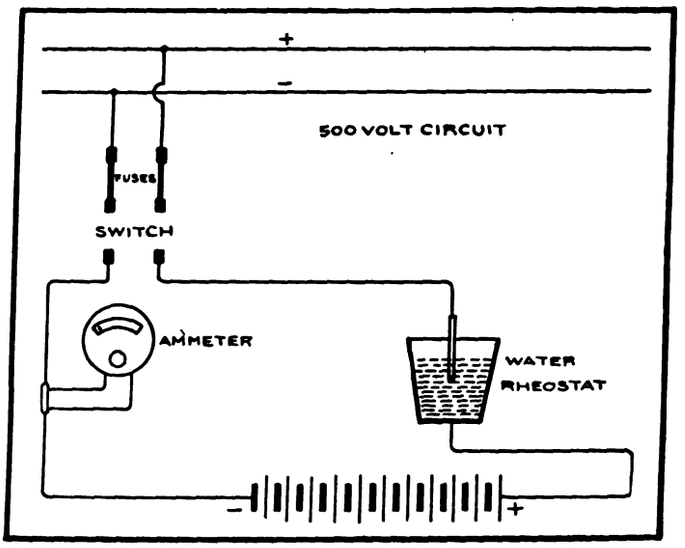

Fig. 674b.

strip which may be immersed to a greater or less degree in the solution.

The water rheostat method is less to be recommended than that in which lamps are employed, for two reasons: In operation it requires very constant and careful attention and adjustment to keep the current at anything like the normal rate; furthermore, great care is necessary to prevent the touching of the plates against each other, which would, of course, practically short circuit the 500 volt system.

Whatever form of resistance is used, the battery should be connected to the grounded side of the 500 volt system, not only to avoid shocks when inspecting the battery, but also to prevent any chance of injuring the battery insulation.

In making the transfer from the regular generator to the 500 volt circuit the wiring should be so arranged that the charging ammeter will be included in the circuit in order that the amount of current passing through the cells may at all times be evident.

RINGING BELLS WITH LIGHTING CURRENT.—(675.)

Will you please tell me the requisite construction of a transformer to transform a 110-volt light current into a current with sufficient voltage and amperage to ring the bells of 15 telephones with 1,000-ohm ringer coils, bridged across a circuit of No. 12 iron wire, five miles long? The light current to be converted from direct to alternating through a "Warner" pole changer? C. L.

No transformer is necessary for the purpose you mention. All that is required is to reduce the amount of current which passes out on your line. This can be accomplished by connecting a 32 c. p. 110 volt lamp in series with one side of the lighting circuit, between the main wires and the pole changer. The pole changer will convert the direct current into the alternating current necessary for the ringing of the telephone bells; as the lamp will reduce the amount of current, and to a certain extent the voltage, 110 volts will not be too heavy for your purpose with this arrangement.

THE EDITOR'S PAGE

PROPOSED EXTENSION OF TELEPHONE SERVICE.

TRANSACTION of postoffice business in urgent cases over telephone lines would be secured by the passage of a measure which is now being considered by the national government. This is in line with a number of other examples of the use of the telephone as an auxiliary method of communication which have been in use long enough to enable the prediction to be reasonably made that the proposed plan would produce results of considerable practical value.

The comparatively low cost of the telegraph for the transmission of short messages over considerable distances causes this method of communication to be used in preference to the telephone in a large number of cases. The sending of a messenger to deliver communications involves a delay which is undesirable and unnecessarily expensive in instances where the person who is the recipient of the message is to be found at a considerable distance from the telegraph office. It has grown to be a common practice to telephone the message from the receiving office.

In this manner the principal causes of delay are eliminated. The persons concerned receive all the advantages which come from the instantaneous nature of electrical transmission, without the payment of the larger costs attached to the use of a telephone line over the entire distance. The plan has proved to be extremely useful to the public.

The proposed adaptation of the telephone to uses of the postoffice is probably a logical outgrowth of the same plan, and would possess the same advantages. It is probable that these benefits would be much greater in rural communities and towns which are not thickly settled than in the larger cities. Residents of districts of this nature are either wholly without delivery service, or receive their mail at intervals of hours or longer on rural free delivery routes. It is, nevertheless, frequently true that the number of incoming mails to the postoffice which is the distributing center is sufficiently large to bring in letters several times each day. These letters must then lie idle until such a time as the carrier may be able to take them on his daily trip, or until the persons to whom they are addressed finds it convenient to call and receive them.

If the bill is enacted, a special stamp will be affixed to letters when delivery of the contents over the telephone is desired. Upon the receipt of such a letter the postmaster at the receiving station will call up the person to whom the letter is addressed and read to him the message. In this way a large amount of the delay which at present is experienced between the time a letter reaches the postoffice and its arrival in the hands of the person to whom it should go will be eliminated. The expense of such a procedure will be comparatively trifling even as compared with the telegraph. As the sender of the letter is usually sufficiently familiar with the train service to points to which he wishes to communicate, it will be impossible to estimate the time which must elapse before the delivery of the message very closely, and there should be no difficulty arising from an unexpected delay of an important message.

A further advantage comes from the fact that many communities are provided with a very complete telephone system where telegraph service is extremely poor. Many small towns are wholly without telegraphic connections, while a very large proportion of the residents are telephone subscribers. Other towns, even though they are provided with a telegraph office suffer from poor and expensive messenger service. In such places the method proposed will furnish means of receiving communications within a moderate time from distant points at small expense. Aside from the important advantages which will so evidently be useful to the public, the measure is of wide interest to telephone companies. It will furnish a most useful argument in favor of extensions of the service. The subject seems to be well worth the attention of telephone companies and managers at this time, when united action will tend to have its maximum effect.

UNJUSTIFIABLE TELEPHONE MESSAGES.

A PARTICULARLY strong argument in favor of measured service for business establishments is furnished by some figures recently given out concerning the uses to which the telephone has been put in certain of the government offices in Washington. An investigation was carried on for a period of two months, and the nature of telephone messages by employees during business hours was determined. This information was then classified, and the results of the division according to the nature of the business showed that only 23 per cent. of the calls were made on affairs which directly related to the government service, while 77 per cent. were personal calls. The sub-division of the personal calls showed that a very large per cent related to entirely frivolous affairs.

Among the items may be mentioned theatre calls, which were 28 per cent. of the whole number; bucket shops took 8 per cent. of the business, and loan calls 4 per cent. The clerks even went so far as to make sufficient poker engagements over the telephone to account for 7 per cent. of the entire business transacted over the telephone lines to the government departments in question.

This experience is doubtless parallel to that of many modern business establishments, and in such cases the telephone company, which operates under a flat rate, is burdened with a large number of messages over each line which could readily be avoided. The result of this is, in addition to the extra load which it places upon the operators, to increase the number of busy reports for the lines over which these conversations take place. The fact that social conversations are usually of greater length than those relating to business matters, is one which must be considered in this connection. The result is the tying up of the lines, which causes the persons calling for the establishment to feel a considerable degree of dissatisfaction with the service in general.

Such dissatisfaction is extremely likely to be visited upon the telephone company, as the head of the business establishment is usually very far from being aware of the extent to which his lines are used upon affairs other than his own. He is likely to be familiar with the regular business carried on over his wires, and to assume that when they are not in use for messages of this class they are idle, and that no one should have difficulty in reaching him. The contract agent has a very poor chance to induce such a subscriber to take additional lines, as he has no practical data to show the necessity of such action from a business standpoint. One of the principal advantages which is inherent in the measured service plan of charging is the elimination of these unnecessary and frivolous calls. As the subscriber watches the number of messages more closely he is able to check such uses of the telephone lines, with the corresponding advantage which comes from the saving of the time of his employees, in addition to a certain improvement in his service. On the other hand, those messages which do go out bring a direct revenue to the telephone company, instead of constituting a drag for which no recompense is received.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

INJURY FROM FALLING INSULATOR.

An insulator improperly adjusted fell and injured a man passing below. We erected and were maintaining the pole, but the cross arm from which the insulator fell was occupied by the wires of a telegraph company under contract with our company. Are we liable under these circumstances?

R. F.

IT is the opinion of the editor that you would be. The telegraph company might also be liable, either jointly or severally, with you. For a case in point see Quill v. Emp. St. Telep. & Teleg. Co., 34 N. Y. S. 470, 37 N. Y. S. 1,149.

HEIGHT OF WIRES AND EXTRAORDINARY LOAD.

A load of poles nearly thirty feet high was driven along the highway across which our wires ran; the load ran into the wire and the driver, who was walking beside the load, was hurt by one of the poles falling off. Can he claim damages when he knew how high the wires were? C. L. J.

TELEPHONE and telegraph lines must be erected along public highways so that their wires do not obstruct ordinary travel over such public highways or render it unsafe, otherwise they are liable in damages for injuries suffered by persons passing thereover; but a company would not be responsible for extraordinarily high loads, and especially when the man injured knew the wires to be of ordinary height.

FIRE CAUSED BY DEFECTIVE WIRING.

IT has been held in a suit for damage by fire caused by defective wiring that the fact that there had been no fire in the building a number of hours, that the fire originated at the exact place where electric wires entered the building, the defective character of the wires used in installing the electric fixtures, the negligent and unworkmanlike manner in which the connection was made with partially uninsulated wire, the probability of fire being caused thereby, all these things standing undisputed and unexplained, justify the submission to the jury of the question of the electric company's negligence. Romano v. Vicksburg Railway and Light Company, 39 Southern, 781.

NEED NOT PAY CITY LICENSE.

SIX suits filed by the city of Lexington, Ky., against the Western Union Telegraph Company, the Postal Telegraph Company, Adams Express Company, the Southern Express Company and two local telephone companies, instituted for the recovery of $250 per annum as a license tax for the privilege of doing a local business, which have been pending in the United States District Court, have been dismissed by Federal Judge A. M. J. Cochran, upon the motion of the plaintiff. The suits were based upon a city ordinance imposing a license tax upon the companies named, which recited that the license was merely for the privilege of doing a local business and not intended to apply to any business between this city and others in the United States.

RESTRAINING THE USE OF EXTENSION TELEPHONES IN CHICAGO.

THE Chicago Telephone Company has filed a bill for an injunction to restrain the Madison Electric Company from installing private telephones connecting with its wires. The position taken by the electric company is that it has a perfect legal right to tap or otherwise connect with wires of the telephone company, that the wires are fixtures of the building, and that the proprietary rights of the telephone company end at the building line. The petitioning corporation's position is that it sends its currents over the wires, even although they may be fixtures, and that no other company has a right to operate desk extension telephones by means of its power.

The electric company advertises that it can save people $30 a year on each desk extension telephone, and it has installed something like 6,000. There are approximately 105,000 telephone subscribers in Chicago, and there is an average of from three to four telephone extensions on each trunk line. It is stated that one jewelry firm has 22 desk extension telephones on one trunk line, and that Beach & Beach and Smoot & Eyer, attorneys in the Ashland block, have ten telephones on one trunk line. The lawyers have been made defendants with the Madison company to the bill for injunction. Beach & Beach a year and a half ago obtained a temporary injunction restraining the Chicago company from interference with their ten extension instruments, based on a threat to deprive them of telephone service, and the matter still is pending in the courts.

Albert D. Wheeler, president of the telephone company, said: "The bill charges conspiracy on the part of certain attorneys and the Madison Electric Company to interfere with our system, tap our wires, use our current, and cause our subscribers, by means of misrepresentation, to break their contracts with us. It is impossible for us to keep up our system to the standard without instruments of uniform character."

TO DELIVER LETTERS OVER THE TELEPHONE.

INDEPENDENT companies are expecting the passage of a bill now before congress, providing that letters may be specially stamped so that the receiving postmaster may be required to call up the addressee and telephone the contents. It is planned to have a stamp something like that used for special deliveries, and costing ten cents. The sender who is desirous of avoiding delays in delivery, where there is only one route service a day, affixes the stamp. As soon as the letter is received, the postmaster will be required to call up the person to whom it is addressed without delay. The result of such a measure will be to greatly popularize the use of the Independent telephones.

WISCONSIN TELEPHONE RATE LAW CLAIMED UNCONSTITUTIONAL.

IT is stated that the Wisconsin Telephone Company will defend the suit instituted by the attorney general for an alleged violation of the laws forbidding telephone companies from charging a higher rate in one city than in another of the same class. The company will contend that the act is unconstitutional and has been drawn so that it really applies to the Wisconsin company and no other. The position of the company is thus stated:

"As a matter of fact there is no actual discrimination in favor of the city of Janesville as against any other city. Population does not entirely fix the rates. There are many other things that must be taken into consideration. For instance, there is the cost of help and the cost of material. It is just like the cost of living. It may cost more to live in one city than it does in another, and it may cost more to run a telephone exchange in one city than in another."

The suit charges that Beloit has higher rates than Janesville, although both are in the ninth class.

IN THE OPERATING FIELD

SEMI-ANNUAL CONVENTION OF INDEPENDENTS HELD AT OKLAHOMA CITY.

MATTERS of interest to the members, in the operation and maintenance of the lines and of methods pursued in giving better service to patrons, were discussed at the meeting of the Oklahoma and Indian Territory Telephone Association held on February 12.

Officers of the association were elected, as follows: President, H. Furman, Geary; vice-president, E. S. Moody, Okeene; secretary-treasurer, L. T. Hine, Purcell. Executive committee—E. E. Westervelt, Oklahoma City; F. H. Wright, El Reno; J. A. Moad, Elk City, and W. J. Steel, Kingfisher.

C. O. Blake, G. W. Bellamy, H. T. Smith, F. H. Wright and Wm. Grimes, officers and directors of the Topeka and El Reno Telephone Company, were elected members of the association. In addition to the valuable progress made in the meeting, the visiting delegates received a great deal of pleasure from the cordial hospitality extended by the Pioneer Telephone and Telegraph Company. The members of the association will have their next meeting at the annual convention in Oklahoma City, the second Monday in August, this year.

SYSTEM AT MAYSVILLE, KY., IN A FLOURISHING CONDITION.

THROUGHOUT the state of Kentucky the Independent business has been growing very rapidly during the past year. New plants have been built and an extensive system of toll lines is being constructed which will ultimately reach every point in the state. Among the companies which show a marked increase in the list of subscribers is the one at Maysville. Under the direction of a competent and courteous management, the service has been extended to upwards of five hundred subscribers, who, with the exception of a number of rural lines, have Independent direct lines. The company gives its subscribers free service to 85 subscribers at the Mays Lick exchange, and to 195 connected with the Mason county system. Upwards of 57 toll points in the same state and in Ohio can now be reached direct and the rates have been placed as low as is consistent with the furnishing of good service.

An interesting feature of the February directory is the introduction of general local advertising in the directory pages. The advertisement of each firm follows its name in the regular list, so that a person looking through the pages of the directory is constantly reminded of an opportunity to give an order or make an inquiry by telephone. This plan can be made to pay for a large portion of the expense incurred in getting out new issues, besides assisting in emphasizing the value of the telephone to the business man.

The officers of the company are: Walter Matthews, president; S. H. Mitchell, vice-president, and Dr. Edwin Matthews, secretary-treasurer and general manager.

GREENE COUNTY TELEPHONE COMPANY WINS OUT IN WAYNESBURG.

INDEPENDENT telephone affairs in Greene County, Pa., have been making good progress under the direction of T. B. Lee, manager of the Greene County Telephone Company. Since the consolidation of the company formerly operating in this region with the Bell company Mr. Lee has been endeavoring to supply the town with Independent service, and has met with opposition which has taken the most annoying forms. His company was granted the privilege of stringing wires upon the poles of the Western Union Telegraph Company, and, while engaged in this work he was ordered to discontinue by the burgess. Upon refusal to do so Mr. Lee was arrested and sentence imposed upon a charge of disorderly conduct. The case was carried to a higher court, which reversed the decision, and stated that Mr. Lee was engaged in an entirely lawful occupation, which he had a right to pursue, and directed that the costs of the proceedings should be placed upon the borough.

Since this decision has been given wires for Independent lines have been carried into Waynesburg on the Western Union poles and sufficient telephones connected to give Waynesburg citizens connection with outside points. The line connects with the Carmichaels Telephone Company, a number of farmers' lines, with Uniontown and other towns along the Monongahela River, and with Pittsburgh over the lines of the Pittsburgh & Allegheny Telephone Company. The Independent lines have been decorated with flags to celebrate the victory, which is much similar to that recently won by Manager Lee when he entered Washington, Pa., in the face of the most determined opposition.

CONSOLIDATION OF INDEPENDENT INTERESTS IN MISSOURI.

AT a recent meeting held at Bunceton, Mo., plans were perfected for the consolidation of the Independent systems of the county. A new company to take over the plants of the existing companies was organized with a capital stock of $200,000.

It is the intention of the Independent company to systematically cover Cooper County with wires so that every precinct will be provided with connections. The consolidation gives a service of 4,000 telephones with 182 miles of trunk line and 150 miles of branch line. Additional trunk and branch lines will be built within the next year.

An executive committee was appointed by the convention to serve for the company. This committee is composed of John S. Elliott, N. A. George, Ed. Cramer, C. A. Sombart, Dr. J. T. Taylor.

GOVERMENT OWNED TELEPHONES FOR ONTARIO.

FOLLOWING the example set by Manitoba, the municipalities of Ontario are circulating petitions for government ownership in that province and for power to expropiate the lines of the Bell Company. The movement was started by Mayor Coatsworth, of Toronto, and is being received with great favor by all classes. In an editorial on the subject the Winnipeg *Telegram* had the following to say: "There is not in all Canada a public service corporation that has been more successful in its dealings with governments and municipal councils than the Bell Telephone Company. The Bell Company has won notable victories over the public at Ottawa, at Toronto and at most of the Eastern capitals. It profits to-day from an illegal contract with the Canadian Pacific Railway, under which the Bell has exclusive right to telephone connection with the Canadian Pacific Railway stations all over Canada. The contract, deliberately designed to shut Independent telephone companies out of railway stations and to strengthen telephone monopoly, was clearly a restraint of trade, but though it was fought, and fought vigorously for two years, it is still valid. The Dominion government and railway commission in turn have yielded to Bell influence and authorized the continuation of a notoriously illegal contract. This case is mentioned merely as an instance of the triumphs which the Bell Company has had in the politics of Canada." The agitation in Ontario for government owned telephones is so strong that the local legislature can do

nothing but follow the example set by Manitoba in taking steps to expropriate the Bell lines and give telephones to the people at one third, or less, the present prices charged.

A TOLL SERVICE REMINDER.

METHODS of keeping their facilities for toll service constantly before the public are being constantly devised by Independent managers. A very attractive and interesting piece of advertising matter has been issued by the Winona Tele-

phone Company, of Winona, Minn. It is a small blotter printed in attractive colors, and presents the situation and the argument clearly and appropriately.

CHICAGO MAYOR SEEKS INFORMATION ON MEASURED SERVICE IN NEW YORK.

THROUGH advertisements in the newspapers of New York, where the measured service system of charging is in use, Mayor Dunne and Chairman Young, of the committee on gas, oil and electric lights, expect to gain valuable information concerning telephone rates on this plan, which the Chicago Telephone Company desires to put into effect.

By information of this kind the mayor believes a fair basis of rates in Chicago can be determined and the question of the comparative desirability of measured service or flat rate can be thrashed out thoroughly.

The advertisement is as follows:

To the Telephone Using Public of New York City: The city of Chicago has now under consideration the question of the revision of telephone rates. In order to obtain information upon the subject the telephone using public of New York are hereby requested to communicate with the undersigned in relation to the measured rate of telephone service now prevailing in the city of New York. Is it satisfactory to the public? Are the rates, in your opinion, reasonable or unreasonable? Is a measured or a flat rate preferable?

EDWARD F. DUNNE,
Mayor of Chicago.
LINN H. YOUNG,
Chairman Committee on Gas, Oil and Electric Lights.

It was suggested that the Bell Telephone Company, which controls both the Chicago and New York companies, might be interested in the New York "referendum" and the replies received by the mayor might be biased, but he did not believe this method will be resorted to by the company.

"At any rate, some idea of the conditions should be gained by this appeal," he said.

NEW LONG DISTANCE TELEPHONE COMPANY TO CONSTRUCT ADDITIONAL TOLL LINES.

ORDERS for the construction of long distance lines which will be available for use by many thousand Independent subscribers have recently been issued by the management of the New Long Distance Telephone Company of Indianapolis. It is said that new trunk lines will be extended to South Bend, where they will connect with the east-and-west trunk lines that are to enter Chicago.

The construction of new trunk lines to Ft. Wayne, Louisville and Richmond to improve the present connections to Eastern points, and to Terre Haute, to improve the St. Louis service, will also be taken up very soon, but the rapid growth of the business has brought a demand for additional facilities. The new lines will be of No. 8 instead of No. 10 copper wire. Trunk lines to all of these points are now in service. Orders also were given to make additions to the equipment in Indianapolis to take care of the new business that is coming to the company and to improve the service.

SAN FRANCISCO BOARD OF SUPERVISORS PASSES TELEPHONE FRANCHISE ORDINANCE.

ON March 6th the San Francisco Board of Supervisors passed, by a vote of 14 against 4, an ordinance providing for the sale of a telephone franchise to the highest bidder. April 23d is the date set for the reception of bids.

INDEPENDENTS IN NOBLE COUNTY, OHIO, CONSOLIDATE.

AN important merger of Independent telephone companies was recently consummated at Caldwell, Ohio, when all the Independent concerns of Noble County consolidated. Marietta capitalists are interested in the deal, which is considered a great victory over the Bell company. Every individual company in Noble County was represented at the conference and signed the agreement.

The new company will be known as the Noble County Telephone Company. The capital stock is $100,000, all of which has been subscribed.

The stockholders elected the following directors: J. H. Shankland, J. Sparling, H. W. Kuntz, L. W. Wheeler, J. S. Jones, Arthur Schafer and W. H. Bowron. The directors organized by electing Mr. Shankland president, Mr. Wheeler vice-president, Mr. Schafer treasurer, and Mr. Bowron secretary.

The companies included in the merger are the Caldwell-Marietta Telephone Company, the Caldwell Independent Telephone Company, the Farmers' Exchange and the Summerfield Telephone Company. The merger was brought about by F. L. Beam, of the United States Telephone Company, of Columbus; J. B. Rhodes, of Zanesville, and Frank Armstrong, of Armstrong Mills.

The new company has over two hundred miles of line and more than two thousand telephones. As soon as possible a number of improvements will be made and the lines extended.

INDEPENDENT COMPANY IN MANITOBA SHOWS GOOD DEVELOPMENT.

IN the summer of 1904 some farmers living in a southeasterly direction from Crystal City, Manitoba, undertook to build a telephone line fourteen miles long to connect their farms with that town. Twenty-one farmers along the route agreed to take telephones and pay a proportionate share of the cost. The line was completed in the fall of the same year and worked perfectly. In the spring of 1905 four new lines were built running into the country in different directions for distances of ten to fifteen miles. A central office was established and a local system in the town was put in operation. In this way the Independent company was started. To-day there are eighty-five rural subscribers and forty-two in Crystal Lake. The plant is co-operative, and the cost of construction to each subscriber is stated to have been approximately $45. A board of managers attends to the business and looks after the maintenance of the lines. For this purpose each subscriber pays about $6 a year.

During the coming summer two new lines will be built, and it is confidently expected that before the year has passed there will be 250 subscribers in service.

The Bell system which was installed in the town contemporaneously with the building of the first local line, has not proved to be a very strong competitor. The Bell rates to-day are $24 for commercial service and $18 for private dwellings. It has less than twenty-five connections in town and has made no progress in the country.

All Copper. Made in 4 Styles

TO GET THE BEST VALUE

is the aim of every economical buyer, and the manufacturer or dealer who meets this condition will get the business. We have it in the switch line.

Trumbull Switches

are built of copper throughout and so designed as to counteract the warping of the Porcelain Base.

The U-shaped formation of the contact springs insures an even and constant pressure on both sides of the knife blades, which is rarely the case with any other switch.

This construction is of the greatest importance where a switch is employed in connection with telephone circuits. It enables the contacts to be kept clean without cutting and eliminates the possibility of resistance due to poor connection.

Use them in your exchange or rural lines and every place where knife switches are employed.

TELEPHONE PATENTS

TELEPHONE.

Arthur F. Boardman, Somerville, Mass., patents (No. 811,029; dated Jan. 30, 1906; filed April 10, 1905; serial No. 254,646; and assigns to the Electric Gas Lighting Company, Boston, Mass.) a telephone for ships, mines, etc.

The essential feature of this invention is to provide means whereby moisture can be excluded from the mechanism. This the inventor accomplishes by employing a metal box and making all joints by means of washers or gaskets. The switch to operate the mechanism is of the plunger type working in watertight bearings and controlled by the movement of the external cover or door. When this is closed the plunger is depressed; opening the door releases it and it thus cuts in the telephone. Signaling buttons are spaced around the inside of the box for use in calling different departments. These also work on the plunger principle. The mouthpiece of the transmitter extends downward and then outward in the form of an L to prevent the lodgement of water in its interior.

SWITCH PLUG MECHANISM.

Adolph C. Gilgen, Passaic, N. J., patents (No. 812,491; dated Feb. 13, 1906; filed Nov. 25, 1904; serial No. 234,139) and assigns to the New York Automatic Telephone Co. of Paterson, N. J., a switch plug mechanism.

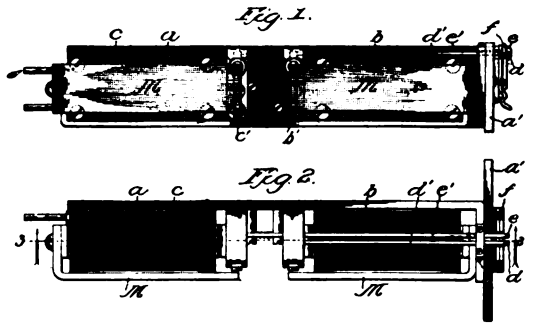
This invention relates to intercommunicating systems and has for its object the improvement of automatic switching mechanisms of the push-button type.

The general principle involved is similar to that employed in all similar systems, the difference existing in mechanical construction. Means are disclosed for constructing and operating a switch in which the contacts shall be kept clean and bright, the parts be accessible for inspection, and for automatically resetting the mechanism by the movement of the receiver hook.

ANNUNCIATOR DROP.

Charles E. Scribner, Jericho, Vermont, patents (No. 812,954, dated Feb. 20, 1906; filed June 24, 1905; serial No. 266,759) and assigns to the Western Electric Company, of Chicago, Ill., an annunciator drop for telephone switchboards.

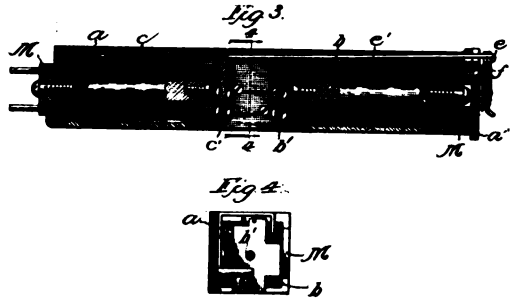
This invention is in the nature of an improvement upon the annunciator described in patent No. 552,726 of January 7, 1896, this improvement being secured through the act of polarizing the



two magnets and their biased armatures, so that upon the passage of direct current of the proper sign the catch normally holding the indicator will be withdrawn, but the other catch will remain undisturbed, thus allowing the indicator to be displayed. When alternating current is passed through the coils of the magnets their armatures will vibrate out of phase and consequently one of the catches will at all times be in engagement with the indicator, thereby preventing it from being operated.

The principal object of this invention is to provide a drop for party lines which will enable the subscribers to call each other without disturbing the exchange.

This can readily be accomplished by so connecting the sub-



station generators that under certain conditions they can be made to deliver either alternating or direct current at will.

Referring to the illustrations, *b*, *c* are two electromagnets having armatures *b'*, *c'*, which are pivoted on brackets carried by the frame *a*. Each of the magnets and its armature is polarized to respond to direct currents of polarity opposite to that which produces a response in its companion. The polarization of the magnets is effected by means of the permanent magnets *M*. The armatures are biased by means of suitable springs which prevent them from responding except to currents which are flowing in the proper direction to strengthen the magnets. The permanent magnets have their poles reversed to impart opposite polarity to the two electromagnets and their armatures, rendering them responsive to current of opposite sign.

Latch arms *d'*, *e'* are secured to the armatures *b'*, *c'*, respectively; latch *d*, carried by the armature *b'* normally engaging the shutter *f*. On attraction of the armature *b'* it is moved out of engagement with the shutter to permit it to fall into a position of display. Latch *e*, on the contrary, is normally out of engagement with the shutter, being brought into the holding position by the attraction of armature *c'*.

When direct current of the polarity to which magnet *b* is responsive traverses the coils of the magnet, the latch *d* releases the shutter, which falls into position.

If, however, alternating current is passed through the magnet coils, their armatures will be rapidly vibrated, but owing to the adjustment of the springs and the different polarities of their magnets, they will vibrate out of step, consequently one latch will always be in engagement with the shutter, thus preventing its operation.

AUTOMATIC SYSTEM.

Bernhard Kugelmann, Bad Kissingen, Germany, patents (No. 814,219; dated March 6, 1906; filed September 15, 1903; serial No. 173,285) an automatic telephone system.

This invention discloses means for the automatic connection of one subscriber's line to another.

The selective devices consist of Thomson bridges located at the exchange and operated in conjunction with electro magnetic devices to establish connection between lines. As the use of mathematics in connection with somewhat complex circuits enters into a further description of the patent we would suggest that all persons interested procure a copy.

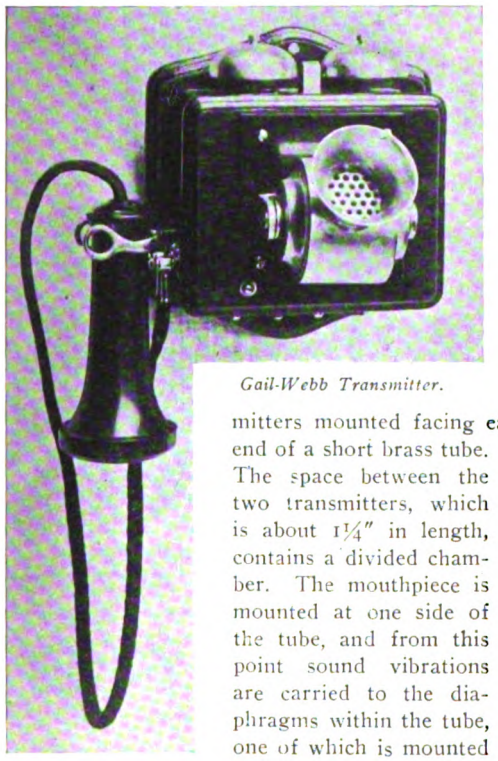
IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

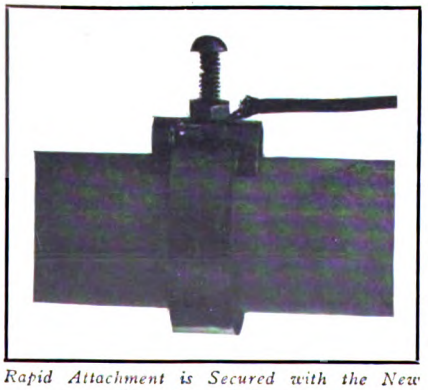
A NOVEL TRANSMITTER.

NOVELTIES in transmitter design which make an exceedingly unique instrument, which at the same time has several very practical advantages, are shown in the accompanying illustrations. The instrument is made by the Gail-Webb Manufacturing Company, 6-8 Lock street, Buffalo, N. Y. The transmitter itself is double; that is, it is not a single transmitter with two diaphragms, but two distinct and separate transmitters mounted facing each other at each end of a short brass tube. The space between the two transmitters, which is about 1¼" in length, contains a divided chamber. The mouthpiece is mounted at one side of the tube, and from this point sound vibrations are carried to the diaphragms within the tube, one of which is mounted near each end.

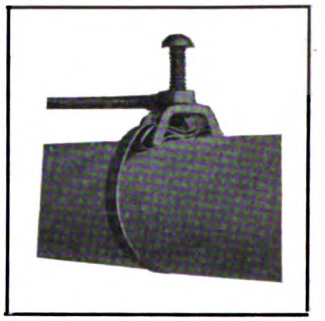


Gail-Webb Transmitter.

The transmitter as a whole is supported by means of trunnions concentric with the two diaphragms, which allow it to be rotated throughout nearly a whole circle. The current is conveyed to the electrodes by one of the trunnions, from which it passes to a corresponding transmitter, thence across to the other transmitter and out by means of the other trunnion. It will be seen that by this arrangement there is no breaking of the contact at the electrodes when the transmitter is turned and the diaphragm always remains vertical. At the same time the rotation of the instrument effectually prevents any possibility of packing of the carbon particles. The manufacturers make an interesting comparison to bring out this point, stating that the operation is very similar to turning a barrel of apples over onto its side, in which it is desired to keep the apples in contact with the two heads of the barrel to maintain the electric circuit. By rolling the barrel on its side the apples are always kept loose and can never pack. It is claimed that the transmitter has shown up very well in transmission tests, especially on long distance service, under very adverse conditions. It is said that the two diaphragms produce a natural tone and that there has been absolutely no trouble from packing.

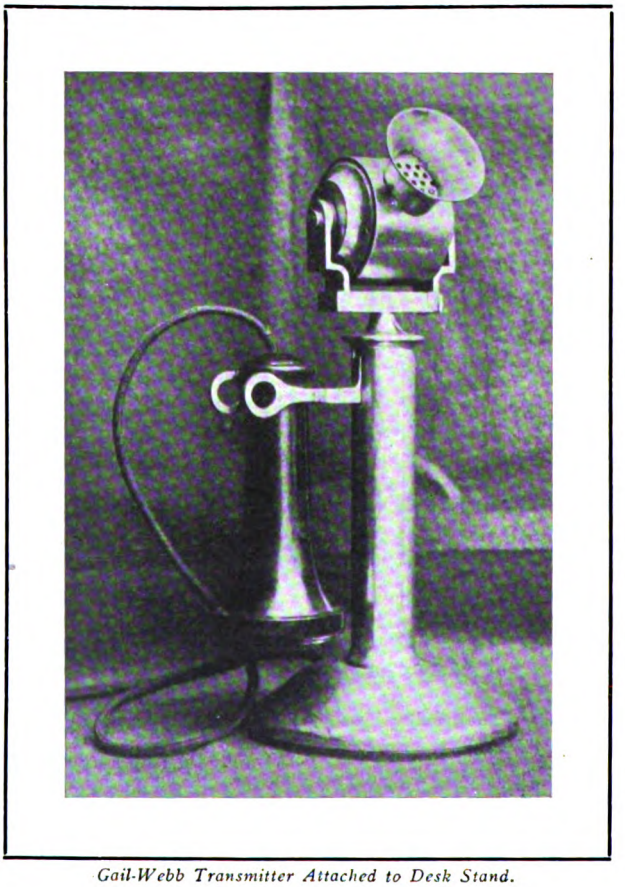


Rapid Attachment is Secured with the New York Ground Clamp.



Turning Down the Screw Draws the Strap Tightly Around the Pipe.

The instrument can be mounted upon any type of standard with very little expense, and the ability to turn the transmitter over enables it to be very conveniently used, as there is no need for picking up the stand and turning it around, thus causing the cords to twist. The manufacturers have recently incorporated under the name given above and the officers of the company are: Harry M. Gail, president and manager; Charles W. Webb, vice-president and secretary; J. W. S. Webb, treasurer. Further information regarding the efficiency of this instrument, prices, etc., can be obtained by writing to the company.



Gail-Webb Transmitter Attached to Desk Stand.

CLAMP FOR GROUND WIRE.

THE New York Ground Clamp, which we illustrate upon this page, is a device for connecting telephone and telegraph ground wires to pipes and cables. It is manufactured by the Yonkers Specialty Company, Yonkers, N. Y. The clamp consists of a strap of soft tinned copper in combination with a brass clamping plate of special form and a tightening screw. The latter is provided with a nut and washer, by means of which the ground wire is fastened tightly in position against the plate. In applying the device to a pipe the screw is withdrawn a sufficient distance to allow the strap to be passed across through the slot and pulled up until it is tight. The screw is then turned until the strap is drawn very tightly about the pipe and the instrument is then ready for the insertion of the

ground wire. The screw point bears on the strap.

It will be seen that this process is very rapid as compared with the alternative method of wrapping the wire many times around the pipe and soldering it. The company claims that practical service in connection with the lines of many large companies which have adopted it shows that it furnishes an extremely satisfactory ground connection at a very low expense. Further information will be sent upon receipt of a request.

THE NEW DEAN SWITCH HOOK LEVER.

SUBSTANTIAL construction and neat design characterize the new switch hook lever designed and manufactured by the Dean Electric Company, Elyria, Ohio. It is made by pressing and drawing it to the proper shape by numerous operations from one piece of heavy sheet brass.

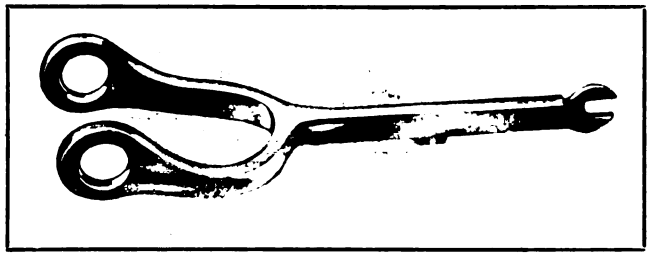

Fig. 3. The Dean lever when completed by the new process.

The number of operations required to form this hook compacts it in such a way as to close all the pores in the metal, thereby strengthening and hardening it so that when completed it has the appearance of a solid metal hook lever. Another point of value is in the strength of the lever at the body of the forks, as at this point more hooks are broken than any other place. It will be noted in the view of the second operation (Fig. 2) that this part of the hook lever is drawn up in the shape of a triangle so as to brace the prongs of the hook and insure great strength. The metal is doubled over, not only on the body of the lower but in both prongs, making the latter very rigid.

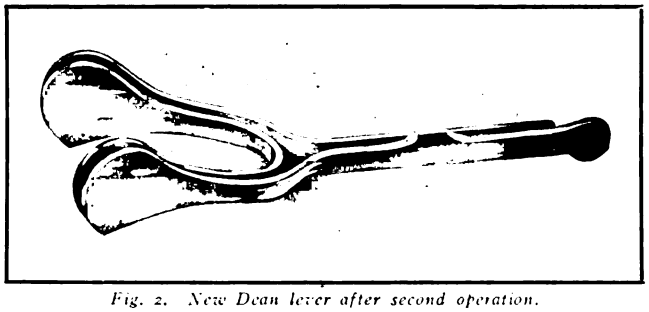

Fig. 2. New Dean lever after second operation.

The accompanying illustrations show the blank, the second operation and the completed hook. As the hook lever, when projecting from the side of a telephone, is subject to much damage in shipping, storage and handling, it is made removable in the Dean construction so as to be left detached until the instrument is mounted in position on the wall. This has the additional advantage of saving packing and storage space. The lever can only be removed by opening the lid of the telephone box, as the release is mounted on the body of the switch, thereby making the device fool proof.

Like all other novel Dean products, these features are protected by pending patent applications.

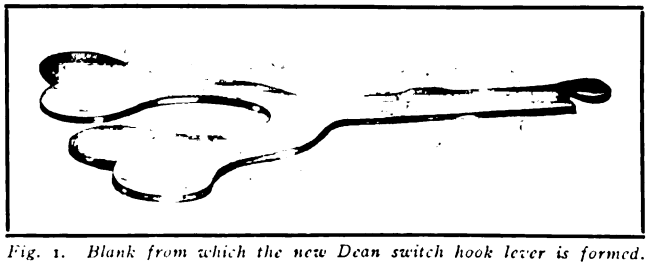

Fig. 1. Blank from which the new Dean switch hook lever is formed.

THE SAND POINT CEDAR COMPANY, Sand Point, Idaho, has a large stock of selected cedar poles on hand from which it can make prompt shipments. The timber handled by this company is claimed to be sound throughout and well seasoned. It is grown in a country which develops magnificent trees. All sizes are carried in stock, so that no delays can occur in securing specified lengths.

MERCURY ARC RECTIFIER OPERATING IN MULTIPLE WITH MOTOR GENERATOR.

THE Pacific States Telephone and Telegraph Company, of San Francisco, has a 40-ampere storage battery in use in its exchange at Alameda, Cal. Until recently this battery has been charged from an equipment consisting of a small direct current generator, driven by a single phase motor of only sufficient capacity to charge the storage battery at a rate of approximately 30 amperes.

This company had recently purchased a 20-ampere General Electric mercury arc rectifier outfit and installed it in the Alameda exchange in order to test it in commercial operation. The load on this exchange is so heavy, however, that if the battery were to be charged at only 20 amperes it would be necessary to keep the charging current on for twelve or fifteen hours per day. It was therefore determined to try to operate the rectifier in multiple with the direct current generator and charge the battery at the normal rate of 40 amperes. The generator was started up and thrown on the battery and the voltage adjusted to give about 10 amperes charging current. Next the rectifier was started in the usual way, adjusted to charge at about 20 amperes and thrown into parallel with the generator. The generator voltage was then raised until the current through the battery was 40 amperes and the charging proceeded.

As the electromotive force of the battery rose and the rectifier current fell off, due to the higher voltage of the generator, the voltage of the rectifier was raised by means of the rheostat at the bottom of the panel. The rectifier voltage could also be varied while the rectifier was operating by moving the compensating reactance switch, as the voltage of the generator kept the arc going while the switch passed over the dead points.

This scheme of operating the mercury arc rectifier in parallel with the generator has been in regular operation ever since it was first tried, and the attendants are very much pleased with it, as they are now enabled to charge the battery in three-quarters of the time previously required.

THE ELECTRIC CABLE COMPANY, of 42 Broadway, New York, has just received from the Bullock Electric Manufacturing Company, of Cincinnati, an order for the new insulating compound, Voltax, for impregnating field and armature coils.

It is claimed that tests which have recently been made of this compound by the Electrical Testing Laboratories of New York have shown that Voltax possesses all of the insulating properties of rubber and in many cases has withstood tests far more severe than rubber. As Voltax has no injurious effects upon copper it does not require tinning before applying the compound, as there is no corrosive action.

THE A. H. RANNEY CONSTRUCTION COMPANY, Mason City, Ia., is prepared to furnish estimates for building high grade exchanges, toll lines and farm lines. The company also furnishes skilled employees for telephone work.

FINANCIAL.

ULLIN, ILL.—The Ullin Telephone Company has increased its capital stock from $2,500 to $5,000.

BORDEN, IND.—The Farmers' Mutual Telephone Company has increased its capital stock from $1,000 to $5,000.

BAINBRIDGE, MICH.—The Bainbridge Telephone Company has increased its capital stock from $2,000 to $10,000.

THREE RIVERS, MICH.—The Three Rivers Telephone Company has increased its capital stock from $35,000 to $50,000.

HANSKA, MINN.—The Hanska Rural Telephone Company has declared a dividend of ten per cent.

MACDOUGALL, N. Y.—The MacDougall Telephone Company is to increase its capital stock from $5,000 to $20,000.

ADA, O.—The Ada Telephone Company has increased its capital stock from $100,000 to $125,000.

EATON, O.—The Eaton Telephone Company has increased its capital stock from $50,000 to $120,000.

SCANDINAVIA, WIS.—The Scandinavia Telephone Company has increased its capital stock from $1,500 to $3,000.

FRANCHISES.

LANGDALE, ALA.—The Langdale Telephone Company has applied for a franchise to extend its lines to West Point.

HELENA, MONT.—Men interested in The Home Telephone and Telegraph Company, of Portland, Oregon, are asking for a franchise at Helena.

HAMMONTON, N. J.—A franchise has been granted to the Hammonton Telephone & Telegraph Company to build a telephone line from Hammonton to the Mullica township line.

HAMILTON, O.—The Hamilton Telephone Company has applied for a franchise to operate a telephone system in Middletown.

WOONSOCKET, R. I.—The New England Shaver Telephone Company, of Providence, R. I., has filed an application for a franchise to operate in Woonsocket.

POMEROY, WASH.—The Automatic Telephone Company has applied for a franchise at Pomeroy.

McLEOD, ALBERTA, CANADA.—The town is applying to the Legislature for powers to build, maintain and operate a municipal telephone system. Address C. H. Baker.

COMBINATIONS.

CHARLESTON, ILL.—The Kinloch Telephone Company, of St. Louis, Mo., has about closed negotiations for the purchase of the plant of the Charleston Telephone Company.

CRESTON, ILL.—The Ogle Co. Telephone Company is to connect its lines with the Tri-Company's lines at Creston.

TABOR, IA.—The City Telephone Company, owned by Bell Bros., has been sold to J. W. Wayrock, of Leavenworth, Kas., on a basis of $57,000.

ELECTIONS.

POMONA, CAL.—The Pomona Valley Telephone & Telegraph Company has elected the following directors: F. W. Thomas, J. Albert Dole, D. S. Parker, C. E. Walker, G. W. Ogle, L. A. Lorbeer and A. M. Dole.

CARBONDALE, ILL.—The Ohio & Mississippi Valley Telephone Company has elected the following officers: President, Ed. Sampson, Anna; vice-president, H. C. Miller, DuQuoin; secretary, F. W. Willard, Anna; treasurer, D. M. Parkinson, Carbondale.

WOOLSTOCK, IA.—The Woolstock Telephone Company has elected the following officers: President, C. H. Clifton; secretary, J. W. Watkins.

HUMBOLDT, NEB.—The Speiser Rural Telephone Company has elected the following officers: C. Lionberger, president; R. F. Conrad, secretary and treasurer.

NEW COMPANIES.

PHOENIX, ARK.—The Consolidated Telephone, Telegraph & Electric Company is to considerably improve its system between Phoenix and Prescott. In California the company is also constructing long distance lines from Imperial to Calexico.

ANDERSON, CAL.—An Independent telephone company has been formed to build a line from Anderson to Orlinda.

PAYETTE, IDAHO.—The Payette Valley Independent Telephone Company contemplates many improvements to its system, among which will be the installation of new exchange apparatus in its new telephone building at Payette. The company will also build a line to New Plymouth.

SAINT ANTHONY, IDAHO.—The Fremont County Independent Telephone Company, with its principal place of business at Saint Anthony, has been incorporated with a capital stock of $5,000. The principal stockholders are the Highland Ranch Improvement Company, William Vanderveer, More & Fuller, G. E. Bowerman, A. C. Langley, George Harrigfield and C. P. Bartlett.

BUSHTON, ILL.—The Seven Hickory and Morgan Township Mutual Telephone Company, at Bushton, has been incorporated with a capital stock of $3,500. The incorporators are as follows: H. Z. Ohair, H. Brown and E. H. James.

FAIRVIEW, ILL.—The Fairview Southwestern Telephone Company, Fairview, has been incorporated with a capital stock of $1,000. Incorporators are Jerome Lawson, Thomas H. Travers and J. E. Barlow.

MARSEILLES, ILL.—The Marseilles Telephone Company has been reorganized with the following directors: M. E. Blanchard, F. T. Neff and A. C. Allen, of Marseilles, and N. C. Richardson and E. H. Moulton, of Minneapolis.

MOUNT TABOR, ILL.—The Mount Tabor Telephone Company has been organized at Mount Tabor with a capital stock of $2,500. Incorporators: Albert Stewardson, J. W. Fleming and Levi Mortz.

RINARD, ILL.—The People's Telephone Company, of Rinard, Ill., has been incorporated with a capital stock of $10,000. The incorporators are J. W. Zimmerman, William Hunt and Isaac Smith.

CHARLOTTESVILLE, IND.—The Charlottesville Northern Telephone Company, Charlottesville, Ind., has been incorporated with the following incorporators: R. S. N. Oldham, C. W. Ramsey, W. R. Johnston.

FLAT ROCK, IND.—The Flat Rock Telephone Company has been reorganized.

TOBINSPORT, IND.—The Tobinsport Telephone Company, Tobinsport, Ind., has been incorporated with a capital stock of $1,000. The incorporators are Quimtilian K. Groves, John C. Esaray and David White.

BATAVIA, IA.—The Batavia Telephone Company, Batavia, Ia., has been incorporated with a capital stock of $25,000. Incorporators: A. V. Beeman and others.

BELLE PLAINE, IA.—The Belle Plaine Mutual Telephone Company has been organized with the following officers: S. A. McCandless, president; C. W. E. Snyder, secretary; Alex. Calvert, treasurer.

GRAFTON, IA.—The Grafton Telephone Company, of Grafton, Ia., has been incorporated with a capital stock of $10,000. The incorporators are Henry J. Tesch and others.

HOLLANDALE, IA.—The Hollandale Mutual Telephone Company, of Hollandale, Winnebago County, has been incorporated with a capital stock of $2,500. S. O. Holland and others incorporators.

PACIFIC JUNCTION, IA.—The Pacific Junction Mutual Telephone Company has been formed with the following officers: John Mulvihill, president; C. F. Anderson, secretary; Charles Kroon, treasurer.

ATHOL, KAS.—The People's Telephone Company, Athol, Kas., has been incorporated with a capital stock of $5,400.

LIBERAL, KAS.—The Liberal-Hugoton Telephone Company has been incorporated with a capital stock of $415.00.

OSAGE CITY, KAS.—The Osage City Telephone Company has been organized with a capital stock of $12,000.

PARSONS, KAS.—The Prairie Telephone Company has secured a New Jersey charter recently to construct and operate telephone lines outside of the State. The capital stock is $200,000, and the incorporators are James A. Plotner and C. M. B. Chase, both of Kansas City, and Fred H. Brown, of Parsons, Kas.

RUSH CENTER, KAS.—The Rush Center Telephone Company, of Rush Center, Kas., has been organized with the following officers: President, W. C. Holmes; vice-president, C. L. Black; secretary, Frank U. Russell; treasurer, C. H. Lyman.

WEST PLAINS, KY.—The Clark's River Telephone Company, West Plains, Graves Co., Ky. (Post Office Hickory Grove), has been incorporated with a capital stock of $3,000. The incorporators are J. W. Davis, W. R. Allen and R. Y. Wilkerson.

FORT KENT, ME.—The St. Francis Telephone Company has been organized at Fort Kent with a capital stock of $5,000. It will build and operate telephone lines in Aroostook County, connecting with the lines of the Fort Kent Telephone Company. The officers of the company are: Frank W. Mallett, of Fort Kent, treas.; J. J. Wheelock, president.

DECKERVILE, MICH.—The Farmers' Telephone Company has been incorporated with a capital stock of $2,000.

PORT SHELDON, MICH.—The Port Sheldon & Lake Shore Telephone Company has been organized with a capital stock of $2,000.

LAMBERTON, MINN.—An Independent telephone company has been formed at Lamberton with the following incorporators: Albert H. Enerson, L. Redding and George J. Grimm.

EXCELSIOR, MO.—An Independent telephone company has been formed at Excelsior. The incorporators are Messrs. Sisson, Bradley, Turner and Beshears.

OUR MOTTO—QUALITY AND PROMPT SHIPMENTS.

KELLOGG "MICHIGAN WHITE" CEDAR POLES

THE poles we handle are all carefully selected, and are the best grade of stock.

All shipments are prompt, subject only to car supply.

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices.

We have recently published a little book giving some very valuable information about Cedar Poles. It contains Specifications, Inspection Comments, Shipping Data, Etc. "Yours for the asking."

THE WEEK'S MESSAGES

BUTTE, MONT.—The Montana Independent Telephone Company has been formed at Butte, Mont. The company will be capitalized at $2,000,000. The following is a list of the parties backing the company: F. Augustus Heinze, Charles R. Leonard, Charles J. Kelly, D. J. Hennessy, H. A. Galloway, Henry Muhler, Herbert B. Brown and F. W. Moss, of Billings. Elmer B. Jones, managing director of the Independent Telephone Company, Salt Lake City, Utah, is interested.

LAWRENCE, NEB.—The Lawrence Telephone Company has been incorporated at Lawrence, Neb.

STEELE CITY, NEB.—The Steele City Telephone Company has been incorporated with a capital stock of $15,000.

THURSTON, NEB.—The Farmers Independent Telephone Company has been incorporated with a capital stock of $7,000.

EXETER, N. H.—The People's Telephone Company, of New Hampshire, has been incorporated with the following incorporators: Warren Brown, Hampton Falls; W. M. Batchelder, Hampton; Geo. A. Carlisle, Augustus Young, Exeter; D. J. Bakie, Kingston. The company will build lines in Exeter, East Kingston, Kingston, Kennington and Hampton, at which places it has secured franchises.

EAST HOMER, N. Y.—The People's Telephone Company has been formed, and will build lines from East Homer through Truxton, Cuyler, Keeney Settlement to Fabius. The new company will have its long distance connections through the Inter-Ocean Telephone & Telegraph Company's toll exchange in Cortland.

FREETOWN CORNERS, N. Y.—The Freetown Telephone Company, Freetown Corners, N. Y., has been incorporated with a capital stock of $2,000. The incorporators are D. B. Smith, B. Hall and Wilber Car, all

OBERON, N. D.—An Independent telephone company has been formed at Oberon, with W. C. Schaffner as president.

OKOLONA, O.—The Farmers' Mutual Telephone Company, of Okolona, has been incorporated with the following incorporators: F. H. Heilman, Isaac F. Durham and others.

THURSTON, O.—The Buckeye Lake Home Telephone Company, of Thurston, has been incorporated with a capital stock of $10,000. The incorporators are W. F. O'Gara, H. C. Chapin, W. R. Nutt, W. G. Palmer and H. J. Brown.

TOLEDO, O.—The Erie Construction Company, of Toledo, has been incorporated with a capital stock of $10,000. The incorporators are James E. Brailey, of the Toledo Home Telephone Company; H. P. Yeager, A. F. Hanson, W. E. Cordill and John C. Newton. The company is to construct telephone lines.

CARTWRIGHT, MAN., CANADA.—The Mather Co-operative Telephone Company has been formed with the following officers: President, T. E. Elliott; vice-president, H. McLean; secretary-treasurer, D. B. McKinnon. The company will commence construction of its lines at once.

HOLLANDALE, WIS.—The Perry-Hollandale Telephone Company, of Hollandale, Iowa County, has been incorporated with a capital stock of $3,000. Incorporators: C. T. Paulson, John Swenson and others.

MEDICINE HAT, ALBERTA, CANADA.—The Alberta South Eastern Telephone Company has been formed at Medicine Hat with the following directors: W. C. Harris, secretary of the Board of Trade; S. T. Fawcett, William Rutherford, George Henry and W. Nicholls. The company will at once build lines to Cypress Hills, a distance of 50 miles. W. C. Harris, secretary of Medicine Hat Board of Trade, will furnish particulars.

MISCELLANEOUS.

BESSEMER, ALA.—At a meeting of farmers, held at Johns, steps were taken to consolidate the shareholders in two mutual lines to form the Oak Grove and Johns Telephone Company. The object of the company is to operate a system connecting up the entire south end of the county and Sumter, Johns and Adger. Arrangements have been made with the People's Home Telephone Company to enter this city and connect with Birmingham over their line. D. W. Houghton was elected president of the company.

NEW ULM, MINN.—Rural residents are making such urgent demands for service in this vicinity that the New Ulm Rural Telephone Company is preparing to rush extensions of its system. The capacity of the switchboard will be increased to accommodate new business.

HIAWATHA, NEB.—Representatives of mutual telephone systems at Huron, Brenner, Bedena, Leona, Robinson, Willis, Powhattan, Fairview and Hamlin, in Kansas, and Preston and Salem, in Nebraska, met at Hiawatha Monday, March 5. A temporary organization was formed with these officers: President, Frank Shaw, Hiawatha; secretary, W. H. Grush, Salem, Neb.; treasurer, G. W. Karrenbrock. Another meeting has been called for April 5 at Hiawatha, when a permanent organization will be effected.

BENTON RIDGE, O.—The Benton Ridge Mutual Telephone Company, which already connects with twenty-three city exchanges, is planning arrangements which will enable it to greatly extend its toll line facilities.

BELMONT, W. VA.—The Belmont Telephone Company and the Union Telephone Company have arranged that their subscribers may have free service over the two lines for the following places: Bethesda, Barnesville, Mt. Olivet, Morristown, Hendrysburg and Belmont, with Bethesda as the exchange for the circuit. The Union Company has a system in the following places: Morristown, Hendrysburg, Fairview, Little Washington, Freeport and Piedmont.

PERSONAL.

J. E. HANNON, formerly district contract agent for the Northwestern Telephone Company, has been promoted to the position of manager of the exchange at Faribault, Minn.

C. D. HENRY has been appointed manager of the exchange of the Southwestern Telephone Company at Van Buren, Ark.

W. A. MILLER, of Harrisburg, Pa., has been appointed manager of the Manchester branch of the American Telephone and Telegraph Company.

D. W. MOORE, of Oil City, has been elected manager of the Petroleum Telephone Company's plant at Titusville, Pa.

W. R. POLLOCK, of Elyria, has taken the management of the Home Telephone Company in Piqua, O.

J. T. RICE, formerly manager of the Southwestern Telegraph and Telephone Company at Austin, has been appointed manager of the exchange at Houston, Tex.

JOHN W. SLIPP has been appointed manager of the Birdsboro, Pa., district for the Conestoga Telephone Company.

New Construction in the Field

PERRIS, CAL.—The Home Telephone Company, of Redlands, is to establish an exchange at Perris.

RUSSELLVILLE, ARK.—The Russellville Telephone Company is making many improvements in its system.

LAKE FORK, ILL.—The Lake Fork Telephone Company is to build a line to Elkhart.

TOLEDO, IA.—The Toledo Commercial Telephone Company is soon to install a modern switchboard and put up 5,000 ft. of new cable.

ELIZABETHTOWN, KY.—The Hardin County Telephone Company, of Elizabethtown, is putting in a new metallic line to Hodgenville. The company also contemplates other extensions.

OWENSBORO, KY.—The Rural Telephone Company, which recently increased its capital stock from $25,000 to $50,000, contemplates many improvements to its system. The increased capital has been provided for the extension of the connections of the company, with especial reference to long distance business.

DENTON, MD.—The Farmers' & Merchants' Telephone Company is to build a line in Talbot, and is also to build lines to Hobbs and Andersontown.

COURTLAND, MINN.—The New Ulm Rural Telephone Company is to extend its lines in Courtland.

MORRILL, MINN.—The Morrill Telephone Company expects to extend its lines to Pierz and Mille Lacs.

HARRISBURG, PA.—The United Telephone Company, of Harrisburg, is to build lines between Altoona and Bedford.

SCRANTON, PA.—The Consolidated Telephone Company is making many improvements in its system, both at Allentown and Hazleton, as well as in Scranton.

BLANCO, TEXAS.—The Martin Telephone Company, of Llano, is putting in an exchange at Blanco, and will build a line to Kendalia.

NEWPORT, TEXAS.—The Independent Telephone Company is building a line from Newport, Texas, to Jacksboro.

OPEQUON, VA.—The Opequon Telephone Company is to build a line to Mountain Falls.

WILDING, W. VA.—The Wilding & Medina Telephone Company is building a line to Elizabeth.

BURLINGTON, WIS.—The Burlington, Brighton & Wheatland Telephone Company, which recently increased its capital from $5,000 to $10,000, intends to construct many new lines, as well as to improve its present system.

ROSENDALE, WIS.—The Rosendale, Springvale, Eldorado and Rogersville Telephone Company, of Rosendale, is to extend its lines to Ripon.

WALWORTH, WIS.—The Walworth Telephone Company is to materially improve its system around the west end of Geneva Lake.

SWIFT CURRENT, SASKATCHEWAN, CAN.—J. T. Booher, of Houston, Texas, is to install a local telephone system at Swift Current.

Paint vs. Protection.

The life of the average pole is not over ten years. Painting does not increase this limit very much and quite frequently gives a false appearance of stability. If painted after it is set up the most needed point for pole protection is missed, the ground line. Here two distinct forces work for its destruction—the earth and the atmosphere. Poles creosoted by our process are protected not only here but throughout. Let us give you some figures which will show you how to save money.

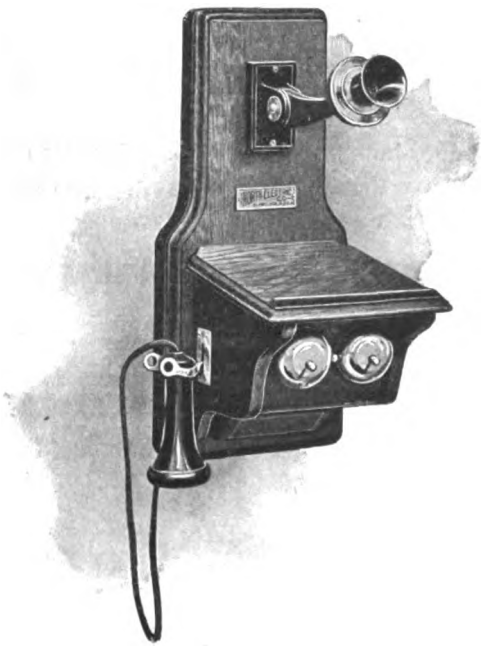
NORTH COMMON BATTERY TELEPHONES



The hinged front of "NORTH'S" common battery wall type telephone renders the condenser and instrument wiring accessible without removing from the wall.

The cabinets are not veneered, but every stick of lumber is from a veneered mill; for they handle nothing but the most beautifully figured woods. The stock is 18 months old, kiln dried 30 days and given a hand-rubbed finish involving 7 processes.

They are equipped with the following standard parts, and will operate on any standard common battery system.

"NORTH'S" Solid Back Transmitter that combines ample volume, perfect articulation, deep penetration and natural pitch.

"NORTH'S" Permanently Adjusted Receiver. The diaphragm does not rest on the outside shell, but on a bell-shaped metal seat—it isn't thrown out of adjustment by unequal expansion of hard rubber and magnet metal.

"NORTH'S" New Ringer, provided with a knife-edge, weighing-scale bearing armature—it can't tighten or drop out of place.

"NORTH'S" Horizontal Lever Adjustable Tension Switchhook with long flexible contact springs—they can't break or become misplaced, and always resume their normal positions.

The parts are individually tested—the transmitter by an engineer. There are two inspections during assembling, a final test on completion and again a test before shipping—just to make sure.

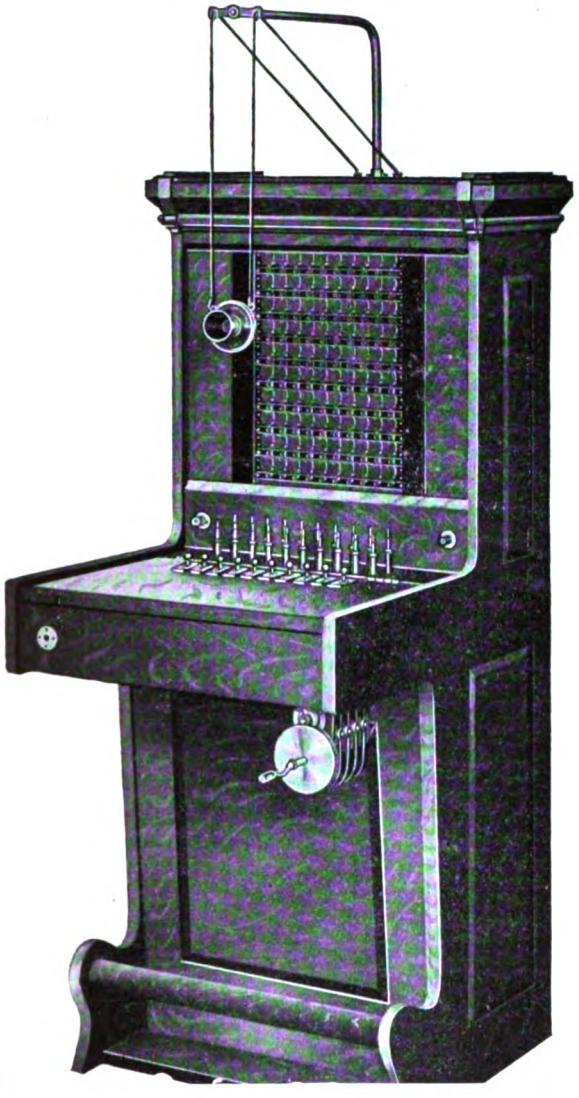
100 % GOOD



PERFECT MAGNETO SWITCHBOARDS

If you are in the market for a new magneto switchboard and wish to give your subscribers the very best service, at the same time reducing your maintenance expenses, it will be to your interest to use a CENTURY switchboard.

Every detail in our switchboards is carefully designed and constructed so as to eliminate all possible chances for trouble.

All parts are so made that they can be readily removed and replaced.

We would like to send you sample drops, jacks and other parts for your inspection, which we will do, charges prepaid. We hope that when you are in the market you will allow us to submit prices to you.

We have a four party selective system that is applicable to any size of magneto exchange.

This system is entirely different from any other in the market.

It has been thoroughly tested and found to be the most practical and economical of any in the market at the present time.

Write for particulars.

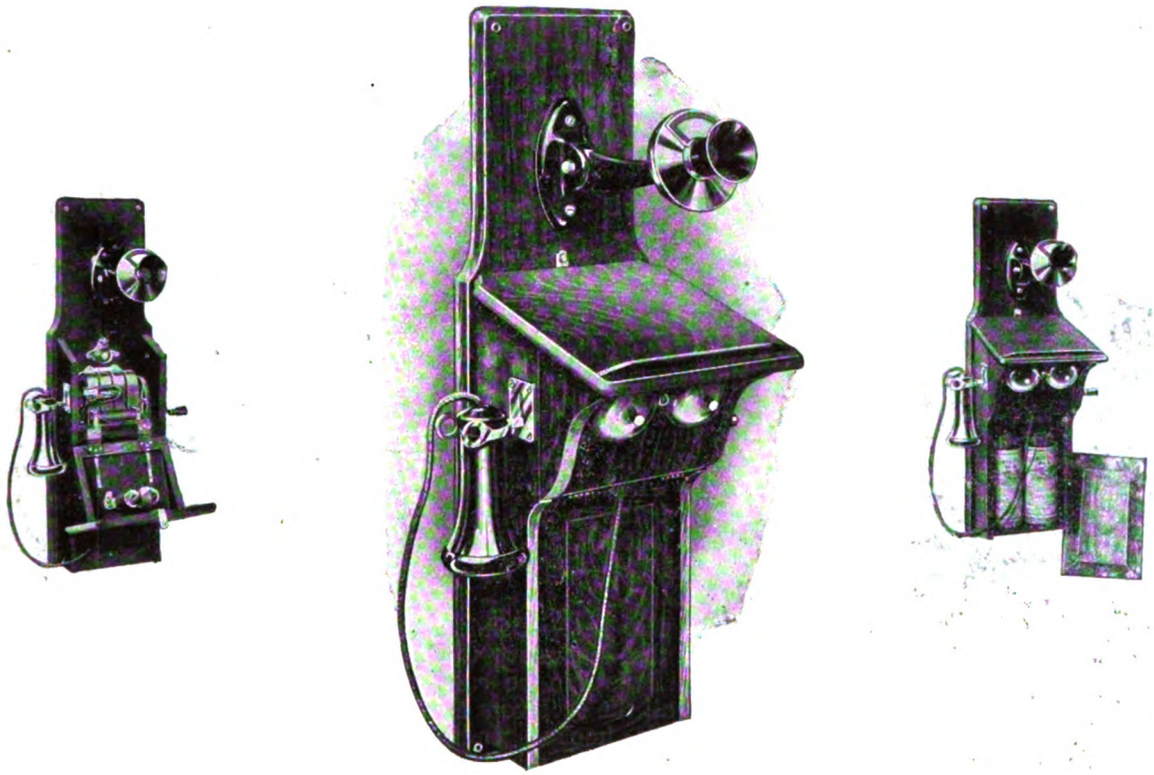
DEAN TELEPHONE APPARATUS



Our Number Fourteen-Twenty Type Telephone, shown in the accompanying illustrations, is a complete magneto local battery instrument, housed in the so-called common battery magneto type cabinet. These telephones are exceptionally neat in design, the woodwork is of the best seasoned quarter sawed oak or walnut carefully put together so as to keep its shape. The cabinet has two compartments for concealing the apparatus, each being separately opened for inspection or repairs, as shown in two of the accompanying illustrations.

The talking equipment—the vital part of a telephone, is the best that can be had, consisting of the celebrated Dean transmitter, receiver and induction coil. The current consumption of this talking apparatus is as small as practical for the best long distance transmission, in fact, so small that two dry cells will give the maximum results for a period of from one and a half to two years' service.

As regards economy and high quality, the Dean telephones are approached by no other so far devised, having achieved a record hitherto unparalleled in the history of the telephone business.

For further information write for our new 8 x 10 inch bulletin No. 101-A which illustrates and describes our complete line of local battery telephones.

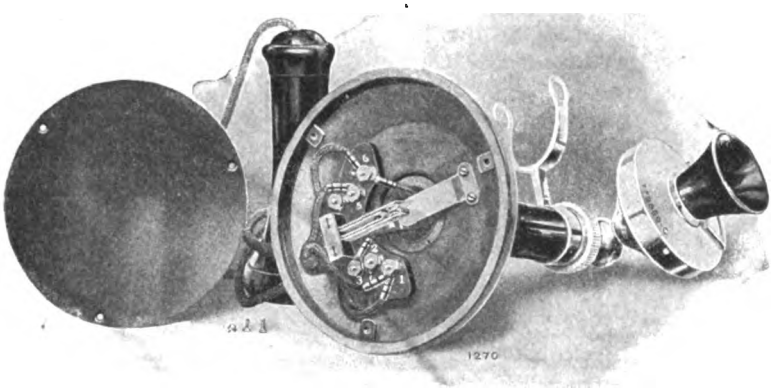
Ever Picture in Your Mind a Perfect Desk Telephone?

Most Telephone Men Have

Doesn't this one come the nearest to your ideal of any you ever saw before?

Could it be more attractive or simple? The finish will not show wear.

There is nothing about it to get out of order. No complicated parts.



Note arrangements of apparatus in base. The hookswitch is so simple and mounted so firmly that it couldn't get out of order.

The simplicity of that transmitter arm makes it attractive.

Better let us send you our Bulletin, describing this telephone more fully, and quote prices on your requirements.

Remember delays pay no dividends.

WE MAKE CABLE

Cable Construction by One Who Knows

We append below a letter from C. H. Judson which we know will carry more weight than any arguments we could set forth relative to the merits of cable construction.

MR C. H. JUDSON.

Mr. Judson's ability and judgment is well proven from the fact that he has been engaged by the following prominent Independent companies as construction engineer:

Twin City Telephone Co.	**Minneapolis and St. Paul, Minn.**
Kansas City Home Telephone Co.	**Kansas City, Mo.**
Mutual Telephone Co.	**Des Moines, Ia.**
Independent Telephone Co.	**Council Bluffs, Ia.**

and is at present acting in a similar capacity for the

Independent Telephone Co.	**Seattle, Wash.**

Mr. Judson says:

THE INDEPENDENT TELEPHONE CO., COUNCIL BLUFFS, IA.

COUNCIL BLUFFS, IA., May 24, 1905.

STROMBERG-CARLSON TELEPHONE MFG. CO., Rochester, N. Y.

Gentlemen:—In Des Moines, with an average of 1,100 operating lines, in the cable plant during the month of February, 1905, the actual cases of line trouble were 11; six of them being blown fuses and the balance various other troubles.

Of course this was a very rare month, but it shows how much line trouble can be reduced by enclosing all the line wires in cables.

The short open wire plant, which includes the short lines attached to the end of the cables where they run out through from one to four blocks, with one or two pairs, gave considerably more trouble than this, although there were probably less than 100 lines in this part of the plant.

Theoretically the only line trouble that a cable plant can produce is caused by actual damage to the lines, as burning of the cables or the breaking of the cables from extraordinary causes, or the breaking or accidental grounding of the rubber covered drop wires.

Another plant in which there were about 1,800 all cable lines working, showed during a very heavy storm about one-fifth as much line trouble as an absolutely new open wire plant of somewhat smaller size, in the same vicinity.

The situation can be figured out by any Exchange Manager if he will take his trouble sheet and sort it up carefully, setting out in one column the cases of trouble which occur in lines which are all cable, and in another column those which occur on open wire lines.

Very truly yours,

(Signed) C. H. JUDSON.

Have you a copy of our Cable Booklet? Ask for Booklet No. 79-B.

INDIVIDUALITY

There are two kinds of individuality; that which means originality of conception and design without departure from that which is considered good practice; and that which stands for construction that is different from anything else without any improvements to recommend it.

An examination of the **Swedish-American** apparatus, illustrates the fact, that it is possible to depart from the old ruts into which telephone designers have fallen.

It will be found that all parts of their telephone are different from any others, but at the same time a definite advance in the art of telephony has been made.

Have you ever noticed the general similarity in the apparatus of all other makers? One might suppose that the ultimate goal had been reached and that there could be no further chance for improvement. Now compare any of the apparatus on the market with that of the **Swedish-American Telephone Company** and you will see that definite and apparent improvements exist.

For instance take the ringer movement. In others the only difference lies in the size of the screw holes, or perhaps, in the method of adjustment or some other minor detail. The general design is exactly similar in all of them. On the other hand the Swedish-American movement has been changed both mechanically and electrically, and in every way it differs from others.

It will be seen that the permanent magnet is mounted between the coils. The armature is in actual contact with the permanent magnet and is pivoted thereto. In the other forms the permanent magnet does not come closer than a distance of one-fourth of an inch. The permanent magnet greatly helps to increase the sensitiveness of the ringer movement. The closer the permanent magnet approaches the armature, the stronger the magnetic field. The stronger the magnetic field, the more sensitive the ringer movement will be. It is easy to see, therefore, why the **Swedish-American** ringer movement is 25 per cent. more sensitive than any other.

One does not see much change in the construction of transmitters of late. Everybody seems to be striving to get as close as possible to the Bell solid back transmitter and when they reach that goal they are satisfied.

It does not seem to occur to the designers that a transmitter better than the Bell can be made, so they rest on their laurels. It is an actual **fact, however,** that the improvements in the **Swedish-American** transmitter have made it greatly superior to the Bell long distance transmitter. It is just the same with all the parts of the telephone. You can see individuality in the lines of all the apparatus.

Take the generator for example. It has 30 per cent. more winding space than any other, and this means a 30 per cent. increase in the output. The induction coil is so mounted that an inexperienced person can replace it in ten seconds without soldering the wire and without danger of disturbing the circuit.

Their receiver is extremely sensitive and has an indestructible shell. Even the method of wiring is original with the **Swedish-American Telephone Company.** The wiring is arranged in the form of a cable, and each wire is insulated with a different colored material. You can trace any wire in the telephone by the color of its insulation without removing the telephone from the wall.

In these days of close competition, it does not pay to rest on your oars. You must keep a continual lookout for any improvements which will make apparatus more convenient for the customers and at the same time more efficient.

The **Swedish-American Telephone Company** is always looking for means of improving their output, and their customers are not slow to appreciate this fact.

Other points of individuality originated by the Swedish-American Telephone Company and copied by their competitors are:

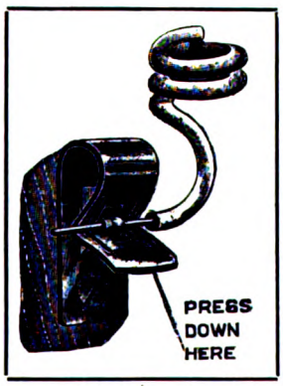
A protector which covers the bell clapper.
Binding posts for the connections of the batteries.
All exposed metal parts insulated from the circuits.
No hinge contacts.
Ringer and transmitter arm bolted on.
Receiver cord binding post inside the cabinet.
Receiver hook does not depend upon contact springs for tension.
Switch-hook perfectly self-contained.
All bridging telephones wired for condensers whether so equipped or not.

SWEDISH-AMERICAN TELEPHONE COMPANY
CHICAGO

To Get Something For Nothing

is usually impossible. There is one instance, however, when it really does happen; that is when you get your dry cells equipped with

FAHNESTOCK SPRING BINDING POSTS



From the very day you install a battery equipped with this Post, the maintenance costs due to poor, broken or corroded contacts are entirely eliminated. This post is not an experiment but an assured success. During the time it has been on the market, millions have been sold and every person who has once tried it will use no other. The reason for this is its absolute merit. It does save money, it does away with battery terminal troubles and is an important factor in giving good service.

We will mail you a sample without charge, and you can get your batteries equipped with it free of cost by specifying Fahnestock Post in your order.

Some Telephone High-Tension Crossings*

By John Putnam.

Illustrations from Photographs by the Author.

WE have now seen the importance of protection for telephone lines when crossing lines carrying high voltages, and in the two preceding numbers of this article there have been shown various types of high tension telephone crossings which have been designed and constructed to fulfil various requirements. It is a question whether any of them can be dignified by the name of standard, with the possible exception of the short span type. They probably all tend towards a standard, but only experience can be relied upon to show upon which line future development should be based. It is evident from the varying forms of these crossings that nearly every one presents its own particular difficulties, according to its location.

In the preceding number of this article the inadvertent omission of a sentence destroyed the sense of the description of a three-phase sine curve. It spoke only of drawing two sine curves when, of course, three would be necessary to carry out the illustration. The reader, if interested, undoubtedly discovered it.

What might be called a special design for a telephone high tension crossing is shown in Fig. 9. The problem presented here was particularly difficult, and for a number of years no telephone circuits crossed at this point. Finally, increased growth in this direction made a crossing at this point very necessary from an economical engineering standpoint and to fit in with a cable plan that was being designed. The reader will notice that the highway crosses a broad railroad right of way. On one side of the tracks is the high tension line, on the other a heavily loaded telegraph line. Evidently the short span crossing is out of the question, and there is not room between the telegraph wires and the roadway for open wire telephone lines with a screen. The high tension line is one carrying 11,500 volts, and is used by the N. Y., N. H. & H. R. R. Co., to operate its third rail system between Hartford, New Britain and Bristol, Conn. On the further side of the bridge, the telephone company has an aerial cable, the can terminal in which it ends being plainly seen. This terminal is provided with fuse and carbon protection. Under the high tension line, a grounded messenger wire is strung from the cable terminal pole to the next pole in the line. Locke rings are fastened to the messenger wire and through them are drawn twisted pairs of No. 14 or No. 18 wires, as preferred; No. 18 is of a sufficiently large gauge and is the cheaper. Should the high tension wire fall, it would probably burn in two on the messenger wire and the probability of its damaging the telephone lines on its way down is slight.

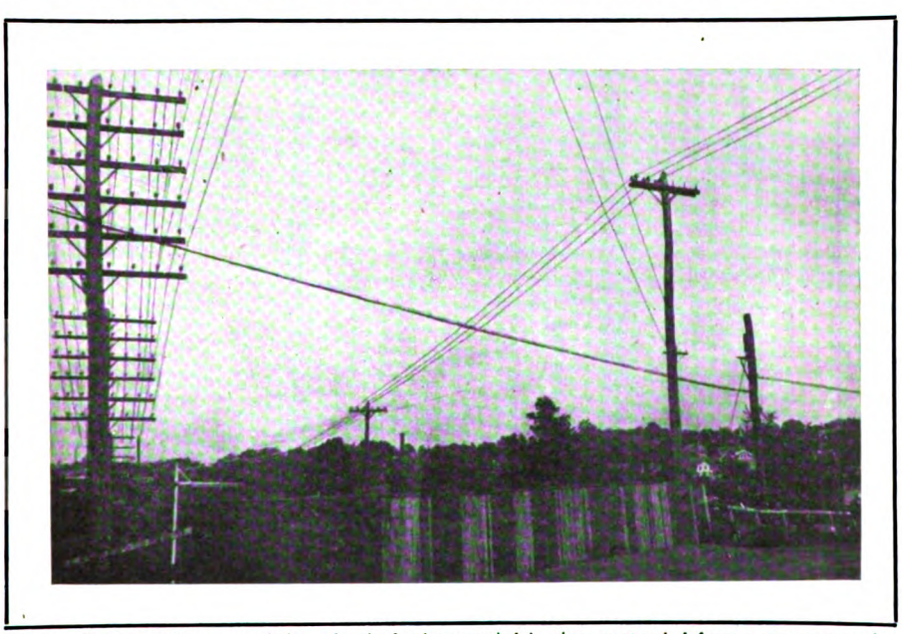

Fig. 9. Telephone lines, consisting of paired wires carried in rings suspended from a messenger wire, crossing beneath 11,500 volt power transmission line.

It will be noticed that on the top of the pole at the right in Fig. 10 there is a guard of wire to catch the high voltage line in case it should become untied. This is an important point and one frequently overlooked. Both telephone and high tension lines should be carefully looked over at all points where they are in close proximity and proper guards placed to catch wires that might become untied and thereby come into contact with neighboring lines. A good design for a guard is one that is frequently seen and used to prevent wires from falling into the highway as the line crosses from one side of the road to the other. It is simply a piece of curved iron in the form of a half circle, drilled and countersunk at one end. It is screwed to the face of the arm near its end and extends outward and up above the end pin, insulator, and outside wire ready to catch it in case it becomes untied. This guard is, of course, intended to be used on the low tension line, or on a line carrying not exceeding 6,600 volts. A 33,000 volt line would easily burn through such a guard or set the wooden arm or pole on fire, consequently such a line would be absolutely dependent upon the security to be obtained by good workmanship in making the tie itself for safety in this particular.

Fig. 11 shows a double crossing and is interesting as involving the idea in Fig. 2, of high poles set close to the line crossed, and a different scheme from any yet shown. It will be noticed that on an arm under the high tension line is a screen made like a net. This net is formed of four longitudinal wires, the two outside ones heavy, uninsulated at the ends, and with a tightening device, while the two inside ones are on insulators and made of a finer gauge wire. The latitudinal wires are given a half connection on the outside heavy wires and are insulated from the inside ones by split porcelains. Fig. 10 shows the netting more plainly. The high tension line, in this in-

stance, carrys 6,600 volts, while the lines crossed are telegraph lines. It is not quite clear to one just what is the purpose of this arrangement, but the intention may be this. Imagine the high tension line to break in the middle of the long span and, like the circus performer, land safely in the net. The current would pass from one broken end through the cross wires onto the outside heavy wire, and, by the same route reversed, to the other broken end of the high tension line, making the high tension circuit good again. This explanation, although theoretically ingenious, may be wrong. Continuing the circus performer analogy, should the outside wire be slightly grounded, as the construction would seem to provide for, the net would be rotten, and the performer, in the guise of the high tension line would go through it and land gracefully on anything underneath, perhaps on a brakeman on a passing train. In all probability this network is made simply to catch the high tension lines should they break at this point, and the fixture seen in Fig. 10, holding the outside wire may be insulated, although it was not possible to determine this by looking at it from the ground.

This high tension line is guyed, as will be seen in Figs. 10 and 11, while the 33,000 volt one is braced, as shown in Fig. 4. Guys don't go well with very high voltage lines, especially when the line is wet, as the following anecdote will show:

It became necessary from a construction standpoint to rock guy a high tension line in the far West. This line was transmitting a current at a voltage of something like 60,000. The guy was attached to the pole below the arm and the other end of it was fastened to a bolt, sunk in a hole drilled in a heavy stone. It is said that the current escaping over this guy melted the solid rock which ran out around the hole in a liquid state. This tale may be put a little broadly, but is not so hard to credit when we recall the experience related in the second number of this article, in which the high voltage wire fell on the ground over a buried conduit made of iron pipe, and fused the earth between the wire and the conduit.

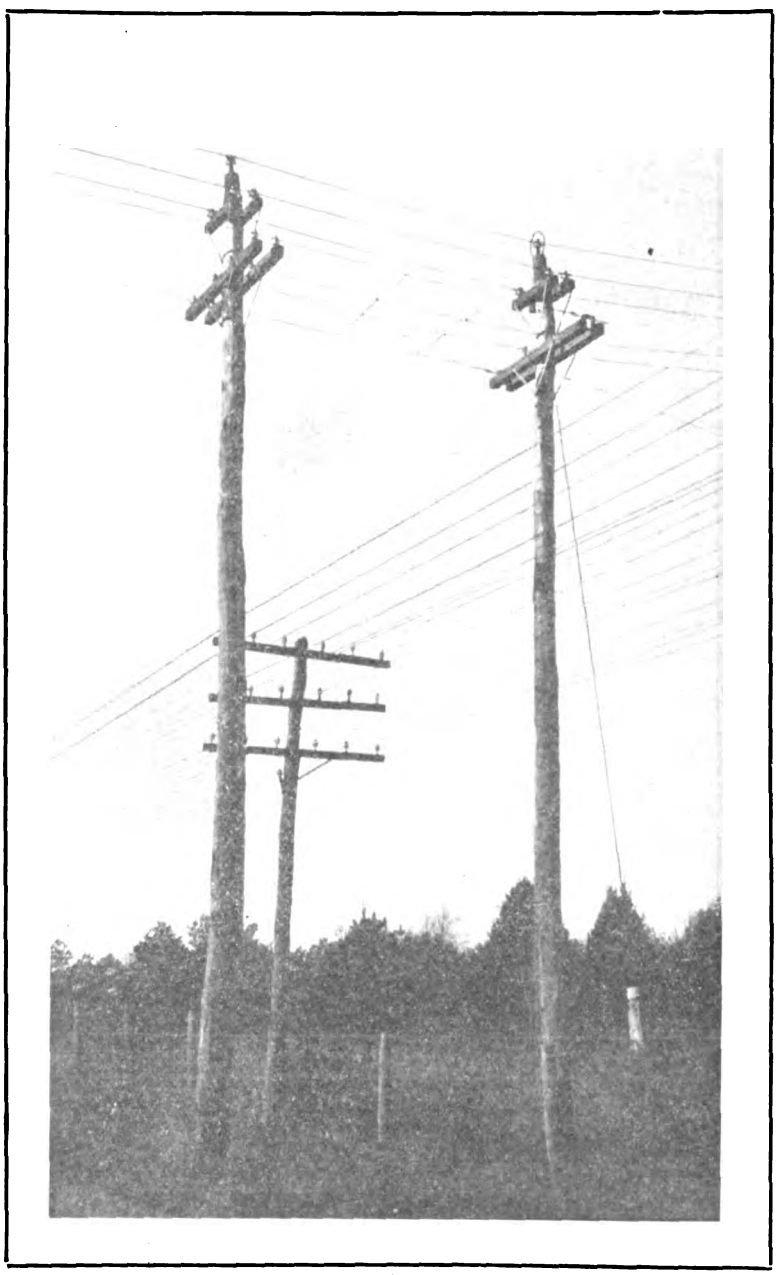

Fig. 10. Typical short span crossing, showing network below high tension wires, mounted well above telephone lines.
